ADULT and CHILD over 16 years, 200 mg once daily for first 14 days then (if no rash present) 200 mg twice daily; NEONATE and CHILD under 8 years, 150 mg/m² (max. 200 mg) once daily for first 14 days, then (if no rash present) 150 mg/m² (max. 200 mg) twice daily or 4 mg/kg (max. 200 mg) once daily for first 14 days then (if no rash present) 7 mg/kg (max. 200 mg) twice daily; CHILD 8–16 years, 150 mg/m² (max. 200 mg) once daily for first 14 days then (if no rash present) 150 mg/m² (max. 200 mg) twice daily or 4 mg/kg (max. 200 mg) once daily for first 14 days then (if no rash present) 4 mg/kg (max. 200 mg) twice daily

Note Duration of once daily dose regimen should not exceed 28 days; if rash not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose for the first 14 days as for new treatment

Viramune® (Boehringer Ingelheim) [TH]

Tablets, nevirapine 200 mg, net price 14-tab pack = £39.67, 60-tab pack = £170.00. Counselling, hypersensitivity reactions

Suspension, nevirapine 50 mg/5 mL, net price 240-mL pack = £59.40. Counselling, hypersensitivity reactions

Other antiretrovirals

ENFUVIRTIDE

Indications HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

Cautions

Hypersensitivity reactions Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge

Counselling Patients should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop

Hepatic impairment manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects)

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 381

Side-effects injection-site reactions; pancreatitis, gastro-oesophageal reflux disease, anorexia, weight loss; hypertriglyceridaemia; peripheral neuropathy, asthenia, tremor, anxiety, nightmares, irritability, impaired concentration, vertigo; pneumonia, sinusitis, influenza-like illness; diabetes mellitus; haematuria; renal calculi, lymphadenopathy; myalgia; conjunctivitis; dry skin, acrrosis, skin palmaris; less commonly hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 382

Dose

BY subcutaneous injection, ADULT and ADOLESCENT over 16 years, 90 mg twice daily; CHILD 6–15 years, 2 mg/kg twice daily (max. 90 mg twice daily)

Fuzen® (Roche) [TH]

Injection, powder for reconstitution, enfuvirtide 108 mg (= enfuvirtide 90 mg/mL when reconstituted with 1.1 mL Water for Injections), net price 108-mg vial = £18.03 (with solvent, syringe, and alcohol swabs). Counselling, hypersensitivity reactions

MARAVIROC

Indications CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

Cautions cardiovascular disease; chronic hepatitis B or C; interactions: Appendix 1 (maraviroc)

Hepatic impairment manufacturer advises caution

Renal impairment if eGFR less than 80 mL/minute/1.73 m², consult product literature

Pregnancy manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies

Breast-feeding see p. 381

Side-effects nausea, vomiting, abdominal pain, dyspepsia, constipation, diarrhoea; cough; dizziness, paraesthesia, asthenia, sleep disturbances, headache, weight loss; muscle spasms, back pain; taste disturbances; rash, pruritus; less commonly pancreatitis, hepatic cirrhosis, rectal bleeding, myocardial infarction, myocardial ischaemia, bronchospasm, seizures, hallucinations, loss of consciousness, polynuropathy, pancytopenia, neutropenia, lymphadenopathy, renal failure, polyuria, and myositis; see also Osteonecrosis, p. 382

Dose

ADULT over 18 years, 300 mg twice daily

Celsentri® (ViiV) [TH]

Tablets, blue, f/c, maraviroc, 150 mg, net-price 60-tab pack = £519.14; 300 mg, 60-tab pack = £519.14

RALTEGRAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions risk factors for myopathy or rhabdomyolysis; chronic hepatitis B or C (greater risk of hepatic side-effects); interactions: Appendix 1 (raltegravir)

Hepatic impairment manufacturer advises caution in severe impairment—no information available

Pregnancy manufacturer advises avoid—toxicity in animal studies

Breast-feeding see p. 381

Side-effects diarrhoea, nausea, vomiting, abdominal pain, flatulence, hypertriglyceridaemia, dizziness,
headache, insomnia, abnormal dreams, asthenia, rash (Stevens-Johnson syndrome reported); less commonly gastritis, hepatitis, pancreatitis, dry mouth, gastro-oesophageal reflux, taste disturbances, pain on swallowing, peptic ulcer, constipation, rectal bleeding, lipodystrophy (see Lipodystrophy Syndrome, p. 382), palpitation, ventricular extrasystoles, bradycardia, hypertension, flushing, chest pain, oedema, dysphonia, epistaxis, nasal congestion, drowsiness, anxiety, appetite changes, confusion, impaired memory and attention, depression, pyrexia, chills, carpal tunnel syndrome, tremor, peripheral neuropathy, erectile dysfunction, gynaecomastia, menopausal symptoms, osteopenia, renal failure, nocturia, polydipsia, anaemia, thrombocytopenia, neutropenia, arthralgia, myalgia, rhombomylitis, visual disturbances, tinnitus, gingivitis, glossitis, acne, pruritus, hyperhidrosis, dry skin, skin papilloma, and alopecia; also reported suicidal ideation; see also Osteonecrosis, p. 382.

Choice

Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin (section 13.10.3) and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following renal transplantation. Foscarnet or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Idoxuridine (section 13.10.3) has been used topically for treating herpes simplex infections of the skin and external genitalia with variable results. Its value in the treatment of shingles is unclear.

Foscarnet (section 5.3.2.2) is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex has been used by mouth for herpes simplex infections; its effectiveness remains unproven.
ACICLOVIR (Acyclovir)

**Indications** herpes simplex and varicella–zoster (see also under Dose)

**Cautions** maintain adequate hydration (especially with infusion or high doses, or during renal impairment); elderly (risk of neurological reactions); **interactions:** Appendix 1 (aciclovir)

**Renal impairment** see Cautions above; also risk of neurological reactions increased; use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²); consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m²; for herpes zoster, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²); for herpes simplex, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².

**Breast-feeding** significant amount in milk after systemic administration—not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

**Pregnancy** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, headache, fatigue, rash, urticaria, pruritus, photosensitivity; very rarely hepatitis, jaundice, dyspnoea, neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness), acute renal failure, anaemia, thrombocytopenia and leucopenia; on intravenous administration—not known to be harmful but manufacturers advises caution.

**Interactions**

- **Drug interactions**
  - Thiazide diuretics: increased risk of renal impairment.
  - Other nephrotoxic agents: increased risk of renal impairment.
  - Neomycin: increased risk of renal impairment.
  - Cimetidine (H₂ receptor antagonist): increased plasma concentration.

- **Food interactions**
  - None known.

**Effects on laboratory tests**

- **Blood** renal impairment, increased creatinine.
- **Respiratory** respiratory depression.
- **Cardiovascular** hypotension, tachycardia.
- **Nervous system** ataxia, dizziness.
- **Liver** increased liver enzymes.
- **Electrolytes** increased serum calcium levels.

**Dose**

- **By mouth**
  - **NEONATE**
    - 5 months–6 months: 200 mg/day; 6 months–1 year: 300 mg/day; 1 year–2 years: 400 mg/day; 2 years–4 years: 600 mg/day.
  - **CHILD**
    - 2–6 years: 800 mg/day (20 mg/kg/day); 6–12 years: 1200 mg/day (20 mg/kg/day).
  - **ADULT**
    - 200 mg/day (20 mg/kg/day).

- **By intravenous infusion**
  - **NEONATE**
    - 5 months–6 months: 6 mg/kg/day; 6 months–1 year: 12 mg/kg/day; 1 year–2 years: 18 mg/kg/day; 2 years–4 years: 24 mg/kg/day.
  - **CHILD**
    - 2–6 years: 30 mg/kg/day; 6–12 years: 40 mg/kg/day.
  - **ADULT**
    - 10–15 mg/kg/day.

**Renal impairment** see Cautions above; also risk of neurological reactions increased; use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²); consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m²; for herpes zoster, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²); for herpes simplex, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².

**By topical application**

- **ADULT**
  - 1% cream: 20 mg/day.
  - 5% cream: 100 mg/day.
  - 1% gel: 20 mg/day.

**By subcutaneous administration**

- **ADULT**
  - 5 mg/kg/day.

**By intramuscular administration**

- **ADULT**
  - 10 mg/kg/day.

**By rectal administration**

- **ADULT**
  - 20 mg/kg/day.

**By intranasal administration**

- **ADULT**
  - 2 mg/kg/day.

**By intrathecal administration**

- **ADULT**
  - 1 mg/kg.

**By intraventricular administration**

- **ADULT**
  - 1 mg/kg.

**Note** Aciclovir doses in BNF may differ from those in product literature.

**Using gel**

- **ADULT**
  - 5% gel: 120 mg/day.

**Infections**

**Herpesvirus infections**

- **Herpes simplex**
  - Genital herpes simplex, treatment of recurrences—consider restarting after two or more recurrences.
  - Non-genital herpes simplex, treatment, 200 mg 5 times daily for 5 days, 3 times daily for 2 days, 2–6 years 400 mg 4 times daily for 5 days; 6–12 years 800 mg 4 times daily for 5 days.

- **Varicella and herpes zoster**
  - Varicella–zoster [unlicensed use] 10–25 mg/kg every 8 hours for 5 days, doubled to 10 mg/kg every 8 hours in varicella–zoster in the immunocompromised and in simplex encephalitis (usually given for at least 10 days in encephalitis, possibly for 14–21 days); prophylaxis of herpes simplex in the immunocompromised, 5 mg/kg every 8 hours.

- **Note** To avoid excessive dosage in obese patients, parental dose should be calculated on the basis of ideal weight for height.

- **Herpes simplex encephalitis** usually given for at least 10 days in encephalitis, possibly for 14–21 days.

- **By topical application**
  - see section 13.10.3 (skin) and section 11.3.3 (eye).

**Aciclovir** (Non-proprietary)

- **Tablets**
  - aciclovir 200 mg, net price 25-tab pack = £4.45; 400 mg, 56-tab pack = £8.10; 800 mg, 35-tab pack = £10.21.

- **Brands include**
  - Virox®

**Dental prescribing on NHS**

- **Aciclovir Tablets** 200 mg or 800 mg may be prescribed.

**Dispersible tablets**

- aciclovir 200 mg, net price 25-tab pack = £2.05; 400 mg, 56-tab pack = £7.24; 800 mg, 35-tab pack = £7.02.

- **Suspension**
  - aciclovir 200 mg/5 mL, net price 125 mL = £38.22; 400 mg/5 mL, 100 mL = £41.55.

- **Note**
  - Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription.

**Intravenous infusion**

- Powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial = £9.13; 500-mg vial = £20.22.

**Electrolytes**

- Na⁺ 1.1 mmol/250-mg vial
  - 20-mL (500-mg) vial = £19.21; 40-mL (1-g) vial = £40.44.

**Zovirax® (GSK)**

- **Tablets**
  - all dispersible, 1 tab, aciclovir 200 mg, net price 25-tab pack = £17.71; 800 mg (scored, Shingles Treatment Pack), 35-tab pack = £55.80.

- **Suspension**
  - both off-white, sugar-free, aciclovir 200 mg/5 mL (banana-flavoured), net price 125 mL = £29.53; 400 mg/5 mL (Double Strength Suspension, orange-flavoured) 100 mL = £33.01.

- **Intravenous infusion**
  - powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial = £9.96; 500-mg vial = £17.72.

**Note** Aciclovir tablets in BNF may differ from those in product literature.

**Attenuation of chickenpox** (if varicella–zoster immunoglobulin not indicated) [unlicensed use].

- **ADULT** and **CHILD** 40 mg/kg daily in 4 divided doses for 7 days starting 1 week after exposure.

- **By intravenous infusion**, treatment of herpes simplex in the immunocompromised, severe initial genital herpes, and varicella–zoster, 5 mg/kg every 8 hours usually for 5 days, doubled to 10 mg/kg every 8 hours in varicella–zoster in the immunocompromised and in simplex encephalitis (usually given for at least 10 days in encephalitis, possibly for 14–21 days); prophylaxis of herpes simplex in the immunocompromised, 5 mg/kg every 8 hours.

**NEONATE and INFANT** up to 3 months, herpes simplex, 20 mg/kg every 8 hours for 14 days (21 days if CNS involvement); varicella–zoster [unlicensed use] 10–20 mg/kg every 8 hours for at least 7 days; **CHILD** 3 months–12 years, herpes simplex or varicella–zoster, 250 mg/m² every 8 hours usually for 5 days, doubled to 500 mg/m² every 8 hours for varicella–zoster in the immunocompromised and in simplex encephalitis (usually given for at least 10 days in encephalitis, possibly for 14–21 days).

- **By topical application**, see section 13.10.3 (skin) and section 11.3.3 (eye).

**Note** Aciclovir doses in BNF may differ from those in product literature.
## FAMCICLOVIR

**Note** Famciclovir is a pro-drug of penciclovir

### Indications
See under Dose

### Cautions
Interactions: Appendix 1 (famciclovir)

### Hepatic impairment
Usual dose in well compensated liver disease (information not available on decompensated)

### Renal impairment
Reduce dose; consult product literature

### Pregnancy
Manufacturer advises avoid unless potential benefit outweighs risk

### Breast-feeding
No information available—present in milk in animal studies

### Side-effects
Nausea, vomiting, abdominal pain, diarrhoea; headache, fatigue, sweating; rare confusion; very rarely jaundice, dizziness, drowsiness, hallucinations, thrombocytopenia, rash (including Stevens-Johnson syndrome); also reported, constipation and fever

### Dose
- Herpes zoster treatment, 500 mg 3 times daily for 7 days or 750 mg 1–2 times daily for 7 days (in immunocompromised, 500 mg 3 times daily for 10 days)
- Genital herpes, treatment of first episode, 250 mg 3 times daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (500 mg twice daily for 5–10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 125 mg twice daily for 5 days or 1 g twice daily for 1 day (500 mg twice daily for 5–10 days in immunocompromised or HIV-positive patients)
- Genital herpes, suppression, 250 mg twice daily (500 mg twice daily in immunocompromised or HIV-positive patients); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
- Non-genital herpes simplex, treatment in the immunocompromised, 500 mg twice daily for 7 days
- **Child** not recommended

**Note** Famciclovir doses in BNF may differ from those in product literature

**Famciclovir (Non-proprietary)**

## VALACICLOVIR

**Note** Valaciclovir is a pro-drug of aciclovir

### Indications
Treatment of herpes zoster; treatment of initial and suppression of recurrent herpes simplex infections of skin and mucous membranes including initial and recurrent genital herpes; reduction of transmission of genital herpes; prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

### Cautions
See under Aciclovir

### Hepatic impairment
Manufacturer advises caution with high doses used for herpes labialis and prevention of cytomegalovirus disease—no information available

### Renal impairment
Maintain adequate hydration; for herpes zoster, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m²; 1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m²; for treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m²; for treatment of herpes labialis, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m², 500 mg as a single dose); for suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m²; for reduction of genital herpes transmission, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m²; reduce dose according to eGFR for cytomegalovirus prophylaxis following solid organ transplantation (consult product literature)

### Pregnancy
See under Aciclovir

### Breast-feeding
See under Aciclovir

### Side-effects
See under Aciclovir but neurological reactions more frequent with high doses

### Dose
- Herpes zoster, 1 g 3 times daily for 7 days; **Child** 12–18 years see BNF for Children
- Herpes simplex, treatment of first episode, 500 mg twice daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (1 g twice daily for 10 days in immunocompromised or HIV-

---

**INOSINE PRANOBEK**

(Inosine acedoben dimepranol)

### Indications
See under Dose

### Cautions
History of gout or hyperuricaemia

### Renal impairment
Manufacturer advises caution; metabolised to uric acid

### Pregnancy
Manufacturer advises avoid

### Side-effects
Reversible increase in serum and urinary uric acid; less commonly nausea, vomiting, epigastric discomfort, headache, vertigo, fatigue, arthralgia, rashes and itching; rarely diarrhoea, constipation, anxiety, sleep disturbances, and polyuria

### Dose
- Muco-cutaneous herpes simplex, 1 g 4 times daily for 7–14 days
- Adjunctive treatment of genital warts, 1 g 3 times daily for 14–28 days
- Subacute sclerosing panencephalitis, 50–100 mg/kg daily in 6 divided doses

**Imunovir® (Newport)**

**BNF 61**

5.3.2 Herpesvirus infections
positive patients); treatment of recurrent infection, 500 mg twice daily for 3–5 days (1 g twice daily for 5–10 days in immunocompromised or HIV-positive patients); CHILD 12–18 years see BNF for Children

- Herpes labialis, treatment, ADULT and CHILD over 12 years, initially 2 g, then 2 g 12 hours after initial dose
- Herpes simplex, suppression, 500 mg daily in 1–2 divided doses (in immunocompromised or HIV positive patients, 500 mg twice daily); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences; CHILD 12–18 years see BNF for Children
- Reduction of transmission of genital herpes, seek specialist advice, 500 mg once daily to be taken by the infected partner
- Prevention of cytomegalovirus disease following solid organ transplantation (preferably starting within 72 hours of transplantation), 2 g 4 times daily usually for 90 days; CHILD 12–18 years see BNF for Children

Valaciclovir (Non-proprietary) (GSK)

Tablets, valaciclovir 500 mg, net price 10-tab pack = £19.48, 42 tab-pack = £81.64. Label: 9

Valtrex® (GSK) (A)

Tablets, f/c, valaciclovir (as hydrochloride) 250 mg, net price 60-tab pack = £123.28; 500 mg, 10-tab pack = £20.59, 42-tab pack = £86.30. Label: 9

5.3.2 Cytomegalovirus infection

Recommendations for the optimum maintenance therapy of cytomegalovirus (CMV) infections and the duration of treatment are subject to rapid change.

Ganciclovir is related to aciclovir but it is more active against cytomegalovirus; it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration; cross-resistance to cidofovir is common.

Valaciclovir (see p. 394) is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir is an ester of ganciclovir which is licensed for the initial treatment and maintenance treatment of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet is also active against cytomegalovirus; it is toxic and can cause renal impairment.

Cidofovir is given in combination with probenecid for CMV retinitis in AIDS patients when ganciclovir and foscarnet are contra-indicated. Cidofovir is nephrotoxic.

For local treatment of CMV retinitis, see section 11.3.3.

CIDOFOVIR

Indications cytomegalovirus retinitis in AIDS patients for whom other drugs are inappropriate

Cautions monitor renal function (serum creatinine and urinary protein) and neutrophil count within 24 hours before each dose; co-treatment with probenecid and prior hydration with intravenous fluids necessary to minimise potential nephrotoxicity (see below); diabetes mellitus (increased risk of ocular hypotony); interactions: Appendix 1 (cidofovir)

Nephrotoxicity Do not initiate treatment in renal impairment (assess creatinine clearance and proteinuria—consult product literature); discontinue treatment and give intravenous fluids if renal function deteriorates—consult product literature

Ocular disorders Regular ophthalmological examinations recommended; iritis and uveitis have been reported which may respond to a topical corticosteroid with or without a cycloplegic drug—discontinue cidofovir if no response to topical corticosteroid or if condition worsens, or if iritis or uveitis recurs after successful treatment

Contra-indications concomitant administration of potentially nephrotoxic drugs (discontinue potentially nephrotoxic drugs at least 7 days before starting cidofovir)

Renal impairment avoid if creatinine clearance less than 55 mL/minute; nephrotoxic

Pregnancy avoid (toxicity in animal studies); effective contraception required during and for 1 month after treatment; also men should avoid fathering a child during and for 3 months after treatment

Breast-feeding manufacturer advises avoid

Side-effects nephrotoxicity (see Cautions above); nausea, vomiting, diarrhoea; dyspnoea; headache, fever, asthenia; neutropenia; decreased intra-ocular pressure, iritis, uveitis (see Cautions above); alopecia, rash, less commonly Fanconi syndrome; also reported, hearing impairment and pancreatitis

Dose

- Initial (induction) treatment, ADULT over 18 years, by intravenous infusion over 1 hour, 5 mg/kg once weekly for 2 weeks (give probenecid and intravenous fluids with each dose, see below)
- Maintenance treatment, beginning 2 weeks after completion of induction, ADULT over 18 years, by intravenous infusion over 1 hour, 5 mg/kg once every 2 weeks (give probenecid and intravenous fluids with each dose, see below)

Probenecid co-treatment By mouth (preferably after food), probenecid 2 g 3 hours before cidofovir infusion followed by probenecid 1 g at 2 hours and 1 g at 8 hours after the end of cidofovir infusion (total probenecid 4 g); for cautions, contra-indications and side-effects of probenecid see section 10.1.4

Prior hydration Sodium chloride 0.9%, by intravenous infusion, 1 litre over 1 hour immediately before cidofovir infusion (if tolerated an additional 1 litre may be given over 1–3 hours, starting at the same time as the cidofovir infusion or immediately afterwards)

Vistide® (Gilead) (C)

Intravenous infusion, cidofovir 75 mg/mL, net price 5-mL vial = £653.22

Caution in handling Cidofovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with water
**GANCICLOVIR**

**Indications**  life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only; prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation; local treatment of CMV retinitis (section 11.3.3)

**Cautions** close monitoring of full blood count (severe deterioration may require correction and possibly treatment interruption); history of cytopenia; potential carcinogen and teratogen; radiotherapy; ensure adequate hydration during intravenous administration; venous—infuse into vein with adequate flow preferably using plastic cannula; children (possible risk of long-term carcinogenic or reproductive toxicity); interactions: Appendix 1 (ganciclovir).

**Contra-indications** hypersensitivity to valganciclovir, ganciclovir, aciclovir, or valaciclovir; abnormally low haemoglobin, neutrophil, or platelet counts (consult product literature)

**Renal impairment** reduce dose if eGFR less than 70 mL/minute/1.73 m²; consult product literature

**Pregnancy** avoid—teratogenic risk; ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment

**Breast-feeding** avoid—present in milk in unquantified quantities

**Side-effects** diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, constipation, flatulence, dysphagia, taste disturbance, hepatic dysfunction; dysphoria, chest pain, cough; headache, insomnia, convulsions, dizziness, peripheral neuropathy, depression, anxiety, confusion, abnormal thinking, fatigue, weight loss, anorexia; infection, pyrexia, night sweats; anaemia, leucopenia, thrombocytopenia, pancytopenia, renal impairment; myalgia, arthralgia; macular oedema, retinal detachment, vitreous floaters, eye pain; ear pain; dermatitis, pruritus; injection-site reactions; less commonly mouth ulcers, pancreatitis, arrhythmias, hypotension, anaphylactic reactions, psychosis, tremor, male infertility, haematuria, disturbances in hearing and vision, and alopecia

**Dose**

- By intravenous infusion, initially (induction) 5 mg/kg every 12 hours for 14–21 days for treatment or for 7–14 days for prevention; maintenance (for patients at risk of relapse of retinitis) 6 mg/kg daily on 5 days per week or 5 mg/kg daily until adequate recovery of immunity; if retinitis progresses initial induction treatment may be repeated; CHILD under 18 years, see **BNF for Children**

**Cymevene** (Roche).

**Intravenous infusion**, powder for reconstitution, ganciclovir (as sodium salt). Net price 500-mg vial = £29.77

**Electrolytes** Na+ 2 mmol/500-mg vial

**Caution in handling** Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water

**VALGANCICLOVIR**

**Note** Valganciclovir is a pro-drug of ganciclovir

**Indications** induction and maintenance treatment of cytomegalovirus retinitis in AIDS patients; prevention of cytomegalovirus disease following solid organ transplantation from a cytomegalovirus-positive donor.

**Cautions** see under Ganciclovir

**Contra-indications** see under Ganciclovir

**Renal impairment** reduce dose; consult product literature

**Pregnancy** see under Ganciclovir

**Breast-feeding** see under Ganciclovir

**Side-effects** see under Ganciclovir

**Dose**

- CMV retinitis, induction, ADULT over 18 years, 900 mg twice daily for 21 days then 900 mg once daily; induction regimen may be repeated if retinitis progresses

- Prevention of cytomegalovirus disease following solid organ transplantation (starting within 10 days of...

**FOSCARNET SODIUM**

**Indications** cytomegalovirus disease [licensed for cytomegalovirus retinitis in AIDS patients only]; mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

**Cautions** monitor electrolytes, particularly calcium and magnesium; monitor serum creatinine every second day during induction and every week during maintenance; ensure adequate hydration; avoid rapid infusion; interactions: Appendix 1 (foscarnet)

**Renal impairment** reduce dose; consult product literature

**Pregnancy** manufacturer advises avoid

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** nausea, vomiting, diarrhoea (occasionally constipation and dyspepsia), abdominal pain, anorexia; changes in blood pressure and ECG; headache, fatigue, mood disturbances (including psychosis), anaemia, paraesthesia, convulsions, tremor, dizziness, and other neurological disorders; rash; impairment of renal function including acute renal failure; hypocalcaemia (sometimes symptomatic) and other electrolyte disturbances; abnormal liver function tests; decreased haemoglobin concentration, leucopenia, granulocytopenia, thrombocytopenia; thrombophlebitis if given undiluted by peripheral vein; genital irritation and ulceration (due to high concentrations excreted in urine); isolated reports of pancreatitis

**Dose**

- CMV disease [licensed for CMV retinitis only], by intravenous infusion, initially (induction) 60 mg/kg every 8 hours or 90 mg/kg every 12 hours, for 2–3 weeks; maintenance 60 mg/kg daily, increased to 90–120 mg/kg if tolerated; if disease progresses on maintenance dose, repeat induction regimen

- Mucocutaneous herpes simplex infection, by intravenous infusion, 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

**Note** Foscarnet doses in BNF may differ from those in product literature

**Foscavir** (Clinigen).

**Intravenous infusion**, foscarnet sodium hexahydrate 24 mg/mL, net price 250-mL bottle = £34.49
transplantation), **ADULT** over 18 years, 900 mg once daily for 100 days (for 100–200 days following kidney transplantation)

**Note** Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily

**Valcyte** (Roche) tablets, pink, 5/c, valganciclovir (as hydrochloride) 450 mg, net price 60-tab pack = £1081.46. Label: 21

**Oral solution**, tutti-frutti flavoured, valganciclovir (as hydrochloride) 250 mg/5 mL when reconstituted with water, net price 100 mL = £239.32. Label: 21

**Caution in handling** Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder

### 5.3.3 Viral hepatitis

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. For details on immunisation against hepatitis A and B infections, see section 14.4 (active immunisation), section 14.5.1 (passive immunisation against hepatitis A), and section 14.5.2 (passive immunisation against hepatitis B).

**Chronic Hepatitis B** Peginterferon alfa (section 8.2.4) is an option for the initial treatment of chronic hepatitis B and may be preferable to **interferon alfa**. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), caution use of peginterferon alfa-2a may be justified in some cases.

**Entecavir** or **tenofovir disoproxil** (see p. 385) are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include **adefovir dipivoxil**, lamivudine (see p. 384), or telbivudine (but see NICE guidance below).

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease; entecavir is not licensed for these patients.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug with a different resistance profile should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir or tenofovir can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir, entecavir, lamivudine, telbivudine, or tenofovir is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir, or a combination of tenofovir with either emtricitabine or lamivudine may be used with other antiretrovirals, as part of ‘highly active antiretroviral therapy’ (section 5.3.1) in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adefovir. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be co-ordinated between HIV and hepatology specialists.

**NICE guidance**

**Entecavir and telbivudine for chronic hepatitis B (August 2008)**

Entecavir is an option for the treatment of chronic hepatitis B.

Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop.

**NICE guidance**

**Tenofovir disoproxil for the treatment of chronic hepatitis B (July 2009)**

Tenofovir is an option for the treatment of chronic hepatitis B.

**Chronic Hepatitis C** Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of **ribavirin** (see p. 400) and **peginterferon alfa** (section 8.2.4) is used for the treatment of chronic hepatitis C (see NICE guidance, below). The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

**NICE guidance**

**Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)**

The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage (‘watchful waiting’). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.
NICE guidance

Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)

The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:

- not previously treated with interferon alfa or peginterferon alfa;
- treated previously with interferon alfa alone or in combination with ribavirin;
- whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
- co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.

Full guidance available at www.nice.org.uk/TA075.

ADEFOVIR DIPIVOXIL

Indications chronic hepatitis B infection with either compensated liver disease, with evidence of viral replication, and histologically documented active liver inflammation and fibrosis or decompensated liver disease

Cautions monitor liver function tests every 3 months, and viral and serological markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); monitor renal function before treatment then every 3 months, more frequently in renal impairment or in patients receiving nephrotoxic drugs; elderly; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis

Renal impairment 10 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m²; consult product literature

Pregnancy toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects nausea, vomiting, dyspepsia, diarrhoea, raised serum amylase and lipase, headache, fatigue, dizziness, sleep disturbances; less commonly thrombocytopaenia, rash, alopecia

Dose

- ADULT over 18 years, not previously treated with nucleoside analogues, 500 micrograms once daily
- ADULT over 18 years with lamivudine-resistant chronic hepatitis B (but see notes above), 1 mg once daily; consider other treatment if inadequate response after 6 months

Counselling To be taken at least 2 hours before or 2 hours after food

Baraclude® (Bristol-Myers Squibb) Tablets, f/c, entecavir (as monohydrate) 500 micrograms (white), net price 30-tab pack = £363.26; 1 mg (pink), 30-tab pack = £363.26. Counselling, administration

Oral solution, entecavir (as monohydrate) 50 micrograms/mL, net price 210-mL pack (orange-flavoured) = £423.80. Counselling, administration

Tельбивудин

Indications chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis

Cautions monitor liver function tests every 3 months, and viral and serological markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis

Renal impairment 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Dose

- ADULT over 18 years, 10 mg once daily

Hepsera® (Gilead) Tablets, adefovir dipivoxil 10 mg, net price 30-tab pack = £296.73

ENTECAVIR

Indications chronic hepatitis B infection with compensated liver disease, evidence of viral replication,
### 5.3.4 Influenza

**Side-effects** nausea, diarrhoea, abdominal pain, raised serum amylase and lipase; cough; dizziness, headache, fatigue; rash; less commonly; taste disturbance, arthralgia, myalgia, myopathy (discontinue treatment), and peripheral neuropathy; also reported, lactic acidosis and rhabdomyolysis.

**Dose**
- **ADULT** and **CHILD over 16 years, 600 mg once daily**

**Sebivo** (Novartis) 

Tablets, f/c, telbivudine 600 mg, net price 28-tab pack = £290.33. Counselling, muscle effects, peripheral neuropathy

**Oseltamivir**

**Oseltamivir in children under 1 year of age**

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. In exceptional circumstances, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

**Pregnancy and breast-feeding**

Although safety data are limited, either oseltamivir or zanamivir can be used in women who are pregnant or breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Zanamivir is preferred during pregnancy; however, oseltamivir is recommended during severe infection or when zanamivir cannot be used.

Oseltamivir is the preferred drug in women who are breast-feeding.

**AMANTADINE HYDROCHLORIDE**

**Indications** see under Dose; parkinsonism (section 4.9.1)

**Cautions** section 4.9.1

**Contra-indications** section 4.9.1

---

1. National surveillance schemes, including those run by the Health Protection Agency, should be used to indicate when influenza is circulating in the community.
2. The Department of Health in England has advised (November 2010) that ‘at risk patients’ also includes women who are pregnant.
Renal impairment section 4.9.1

Pregnancy section 4.9.1

Breast-feeding section 4.9.1

Side-effects section 4.9.1

Dose

- Influenza (see also notes above), ADULT and CHILD over 10 years, treatment, 100 mg daily for 4–5 days; prophylaxis, 100 mg daily usually for 6 weeks or with influenza vaccination for 2–3 weeks after vaccination

Lysovir (Alliance)...

Capsules, red-brown, amantadine hydrochloride 100 mg, net price 5-cap pack = £2.40, 14-cap pack = £3.76. Counselling, driving

Symmetrel (Alliance)...

Section 4.9.1

OSELTMIVIR

Indications see notes above

Renal impairment for treatment, use 75 mg once daily or 30 mg twice daily if eGFR 10–30 mL/minute/1.73 m²; for prevention, use 75 mg every 48 hours or 30 mg once daily if eGFR 10–30 mL/minute/1.73 m²; avoid for treatment and prevention if eGFR less than 10 mL/minute/1.73 m²

Pregnancy use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 399

Breast-feeding amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 399

Side-effects nausea, vomiting, abdominal pain, diarrhoea; headache; conjunctivitis; less commonly eczema; also reported hepatitis, gastro-intestinal bleeding, arrhythmias, neuropsychiatric disorders (more frequent in children and adolescents), visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

- Prevention of influenza, ADULT and CHILD over 13 years, 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic; CHILD under 1 month (see notes above), 2 mg/kg once daily for 10 days for post-exposure prophylaxis; 1–3 months (see notes above), 2.5 mg/kg once daily for 10 days for post–exposure prophylaxis; 3 months–1 year (see notes above), 3 mg/kg once daily for 10 days for post-exposure prophylaxis; 1–13 years, body-weight under 15 kg, 30 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 15–23 kg, 45 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 23–40 kg, 60 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight over 40 kg, adult dose

- Treatment of influenza, ADULT and CHILD over 13 years, 75 mg every 12 hours for 5 days; CHILD under 1 month (see notes above), 2 mg/kg every 12 hours for 5 days; 1–3 months (see notes above), 2.5 mg/kg every 12 hours for 5 days; 3 months–1 year (see notes above), 3 mg/kg every 12 hours for 5 days; 1–13 years, body-weight under 15 kg, 30 mg every 12 hours for 5 days, body-weight 15–23 kg, 45 mg every 12 hours for 5 days, body-weight 23–40 kg, 60 mg every 12 hours for 5 days, body-weight over 40 kg, adult dose

Note Not licensed for use in children under 1 year of age unless there is a pandemic

5.3.5 Respiratory syncytial virus

Ribavirin inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is given by mouth with peginterferon alfa or interferon alfa for the treatment of chronic hepatitis C infection (see Viral Hepatitis, p. 397). Ribavirin is also effective in Lassa fever (unlicensed indication).
Palivizumab is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

**PALIVIZUMAB**

**Indications** see notes above

**Cautions** moderate to severe acute infection or febrile illness; thrombocytopenia; serum-palivizumab concentration may be reduced after cardiac surgery

**Contra-indications** hypersensitivity to humanised monoclonal antibodies

**Side-effects** fever, injection-site reactions, nervousness; less commonly diarrhoea, vomiting, constipation, haemorrhage, rhinitis, cough, wheeze, pain, drowsiness, asthenia, hypokinesia, leucopenia, and rash; also reported, apnoea, hypersensitivity reactions (including anaphylaxis), convulsions and thrombocytopenia

**Dose**

- By intramuscular injection (preferably in anterolateral thigh), 15 mg/kg once a month during season of RSV risk (child undergoing cardiac bypass surgery, 15 mg/kg as soon as stable after surgery, then once a month during season of risk); injection volume over 1 mL should be divided between more than one site

**Synagis®** (Abbott) ▼ [Ribavi]

**Injection** powder for reconstitution, palivizumab, net price 50-mg vial = £360.40; 100-mg vial = £663.11

**5.3.5 Respiratory syncytial virus 401**

**treatment and for 4 months after treatment in women and for 7 months after treatment in men; routine monthly pregnancy tests recommended; condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen); cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration); goitre, determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—should discontinue if abnormalities or laboratory abnormalities develop (consult product literature); eye examination recommended before treatment; eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops; test thyroid function before starting and then every 3 months in children; risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

**Interactions:** Appendix 1 (ribavirin)

**Contra-indications** Specific contra-indications for oral treatment: Severe cardiac disease, including unstable or uncontrolled cardiac disease in previous 6 months; haemoglobinopathies; severe debilitating medical conditions; autoimmune disease (including autoimmune hepatitis); uncontrolled severe psychiatric history; history of severe psychiatric condition in children

**Hepatic impairment** no dosage adjustment required; use oral ribavirin with caution in severe hepatic dysfunction or decompensated cirrhosis

**Renal impairment** plasma-ribavirin concentration increased; avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely

**Pregnancy** avoid; teratogenicity in animal studies; see also Cautions above

**Breast-feeding** avoid—no information available

**Side-effects**

Specific side-effects for inhaled treatment

- Worsening respiration, bacterial pneumonia, and pneumothorax
- Haemolytic anaemia (anaemia may be improved by epoetin); also (in combination with peginterferon alfa or interferon alfa) nausea, vomiting, dyspepsia, abdominal pain, flatulence, constipation, diarrhoea, colitis, chest pain, palpitation, tachycardia, peripheral oedema, changes in blood pressure, syncope, flushing, cough, dyspnoea, headache, dizziness, anaemia, impaired concentration and memory, sleep disturbances, abnormal dreams, anxiety, depression, suicidal ideation (more frequent in children), psychoses, dysphagia, weight loss, dysphonia, paraesthesia, hypo/hyperthermia, rashes, sweating, psoriasis, photosensitivity, and acne; hyperglycaemia, menstrual disturbances, breast pain, arthralgia, sexual dysfunction, micturition disorders, leucopenia, thrombocytopenia, lymphadenopathy, dehydration, hypocalcaemia, myalgia, arthralgia, hyperuricaemia, visual disturbances, eye pain, dry eyes, hearing impairment, tinnitus, earache, dry mouth, taste disturbances, mouth ulcers, stomatitis, glositis, tooth disorders, gingivitis, alopecia, pruritus, dry skin, rash (including very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis), increased sweating, psoriasis, photosensitivity, and acne; less commonly pancreatitis, gastro-intestinal bleeding, and hypertriglyceridaemia, rarely peptic ulcer, arthralgia, cardiomyopathy, myocardial infarction, pericarditis, stroke, interstitial pneumonitis, pulmonary embolism, seizures, renal failure, vasculitis, rheumatoid arthritis, systemic lupus erythematosus, sarcoidosis, optic neuropathy, and retinal haemorrhage; very rarely aplastic anaemia and peripheral ischaemia, in children also growth retardation (including decrease in height and weight), palor, tachypnoea, hyperkinesia, vini- lism, and skin discoloration

**Dose**

- See preparations below

---

1. For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at www.dh.gov.uk/immunisation
5.4 Antiprotozoal drugs

Copegus® (Roche) Tablets, f/c, ribavirin 200 mg (pink), net price 42-tab pack = £78.50, 112-tab pack = £236.65, 168-tab pack = £369.98; 400 mg (red-brown), 56-tab pack = £246.65. Label: 21

**Dose** chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), ADULT over 18 years, body-weight under 75 kg, 400 mg in the morning and 600 mg in the evening; body-weight 75 kg and over, 600 mg twice daily

Note: Patients with chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C require a lower dose of Copegus® (in combination with peginterferon alfa), usual dose 400 mg twice daily

Rebetol® (Schering-Plough) Capsules, ribavirin 200 mg, net price 94-cap pack = £160.69, 140-cap pack = £267.81, 168-cap pack = £321.38. Label: 21

**Oral solution**, ribavirin 200 mg/5 mL, net price 100 mL (bubble-gum-flavoured) = £67.08. Label: 21

**Dose** chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), ADULT over 18 years, body-weight under 65 kg, 400 mg twice daily; body-weight 65–81 kg, 600 mg twice daily; body-weight 81–105 kg, 600 mg twice daily; body-weight over 105 kg, 600 mg in the morning and 600 mg in the evening; body-weight 75 kg and over, 600 mg twice daily

**Inhalation**, ribavirin 6 g for reconstitution with 300 mL water for injections. Net price 3 × 6-g vials = £349.00

**Dose** bronchiolitis, by aerosol inhalation or nebulisation (via small particle aerosol generator) of solution containing 20 mg/mL for 12–18 hours for at least 3 days; max. 7 days

Virazole® (Meda) Inhalation, ribavirin 6 g for reconstitution with 300 mL water for injections. Net price 3 × 6-g vials = £349.00

**Dose** bronchiolitis, by aerosol inhalation or nebulisation (via small particle aerosol generator) of solution containing 20 mg/mL for 12–18 hours for at least 3 days; max. 7 days

5.4.1 Antimalarials

5.4.1 Antimalarials

Malarone

Alternatively, Malarone® or Riamet® may be given instead of quinine. It is not necessary to give

1. Valid for quinine hydrochloride, dihydrochloride, and sulphate; not valid for quinine bisulphate which contains a correspondingly smaller amount of quinine.
doxycycline, clindamycin or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment.

The adult dose of Malarone® by mouth is:
- 4 ('standard') tablets once daily for 3 days.

The dose of Riamet® by mouth for adult with body-weight over 35 kg is:
- 4 tablets initially, followed by 5 further doses of 4 tablets each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours).

**Parenteral.** If the patient is seriously ill or unable to take tablets, quinine should be given by intravenous infusion [unlicensed]. The adult dosage regimen for quinine by infusion is:
- Loading dose of 20 mg/kg (up to maximum 1.4 g) of quinine salt infused over 4 hours then 8 hours after the start of the loading dose, maintenance dose of 10 mg/kg (up to maximum 700 mg) of quinine salt infused over 4 hours every 4 hours (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline or clindamycin as above).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

**Children**

**Oral.** Quinine is well tolerated by children although the salts are bitter. The dosage regimen for quinine by mouth for children is:
- 10 mg/kg (of quinine salt3; max. 600 mg) every 8 hours for 7 days together with or followed by Clindamycin 7–15 mg/kg (max. 450 mg) every 8 hours for 7 days [unlicensed indication] or in children over 12 years, doxycycline 200 mg once daily for 7 days or if the parasite is likely to be sensitive, pyrimethamine with sulfadoxine as a single dose [unlicensed; up to 4 years and body-weight over 5 kg, pyrimethamine 12.5 mg with sulfadoxine 250 mg; 5–6 years, pyrimethamine 25 mg with sulfadoxine 500 mg; 7–9 years, pyrimethamine 37.5 mg with sulfadoxine 750 mg; 10–14 years, pyrimethamine 50 mg with sulfadoxine 1 g; 14–18 years, pyrimethamine 75 mg with sulfadoxine 1.5 g

Alternatively, Malarone® or Riamet® may be given instead of quinine; it is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment. The dose regimen for Malarone® by mouth for children over 40 kg is the same as for adults (see above); the dose regimen for Malarone® for smaller children is reduced as follows:
- body-weight 5–8 kg, 2 ‘paediatric’ tablets once daily for 3 days; body-weight 9–10 kg, 3 ‘paediatric’ tablets once daily for 3 days; body-weight 11–20 kg, 1 ‘standard’ tablet once daily for 3 days; body-weight 21–30 kg, 2 ‘standard’ tablets once daily for 3 days; body-weight 31–40 kg, 3 ‘standard’ tablets once daily for 3 days.

The dose regimen of Riamet® by mouth for children over 12 years and body-weight over 35 kg is the same as for adults (see above). The dose regimen for Riamet® for children under 12 years is as follows:
- body-weight 5–15 kg 1 tablet initially, followed by 5 further doses of 1 tablet each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours); body-weight 15–25 kg 2 tablets initially, followed by 5 further doses of 2 tablets each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours); body-weight 25–35 kg 3 tablets initially, followed by 5 further doses of 3 tablets each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)

**Parenteral.** The dose regimen for quinine by intravenous infusion for children is calculated on a mg/kg basis as for adults (see above).

**Pregnancy**

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses of oral and intravenous quinine given above (including the loading dose) can safely be given to pregnant women. Clindamycin 450 mg every 8 hours for 7 days [unlicensed indication] should be given with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

**Benign malarials (treatment)**

Benign malaria is usually caused by Plasmodium vivax and less commonly by P. ovale and P. malariae. Chloroquine® is the drug of choice for the treatment of benign malarials (but chloroquine-resistant P. vivax infection has been reported from Indonesia, New Guinea and some adjacent islands).

The adult dosage regimen for chloroquine by mouth is:
- initial dose of 620 mg of base then
- a single dose of 310 mg of base after 6 to 8 hours

Chloroquine alone is adequate for P. malariae infections but in the case of P. vivax and P. ovale, a radical approach is required for radical cure.

---

1. In intensive care units the loading dose can alternatively be given as quinine salt® 7 mg/kg infused over 30 minutes followed immediately by 10 mg/kg over 4 hours then (after 8 hours) maintenance dose as described.
2. Important: the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours.
3. Valid for quinine hydrochloride, dihydrochloride, and sulphate; not valid for quinine bisulphate which contains a correspondingly smaller amount of quinine.
4. Maintenance dose should be reduced to 5–7 mg/kg of quinine salt® in patients with severe renal impairment, severe hepatic impairment, or if parentral treatment is required for more than 48 hours.
5. For the treatment of chloroquine-resistant benign malaria, Malarone® [unlicensed indication], quinine, or Riamet® [unlicensed indication] can be used; as with chloroquine, primaquine should be given for radical cure.
cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine\textsuperscript{1} [unlicensed] given after chloroquine; in P. vivax infection primaquine is given in an adult dosage of 30 mg daily for 14 days and for P. ovale infection it is given in an adult dosage of 15 mg daily for 14 days.

**Children** The dosage regimen of chloroquine for benign malaria in children is:
- initial dose of 10 mg/kg of base (max. 620 mg) then
  - a single dose of 5 mg/kg of base (max. 310 mg) after 6–8 hours
  - a single dose of 5 mg/kg of base (max. 310 mg) daily for 2 days

For a *radical cure*, primaquine\textsuperscript{1} [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age. In *P. vivax* infection primaquine is given in a dose of 500 micrograms/kg (max. 30 mg) daily for 14 days, and for *P. ovale* infection it is given in a dose of 250 micrograms/kg (max. 15 mg) daily for 14 days.

**Parenteral** If the patient is unable to take oral therapy, quinine can be given by *intravenous infusion* [unlicensed]. The dose (for adults and children) is 10 mg/kg (max. 700 mg) of quinine salt\textsuperscript{2} infused over 4 hours every 8 hours, changed to oral chloroquine as soon as the patient’s condition permits.

**Pregnancy** The adult treatment doses of chloroquine can be given for benign malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be **postponed** until the pregnancy is over; instead chloroquine should be continued at a dose of 310 mg each week during the pregnancy.

### Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists and may differ from advice in product literature. Weight is a better guide than age. If in doubt telephone centres listed on p. 402.

#### Risk of exposure to malaria
- **Risk factors:** age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen).

### Protection against bites

**Prophylaxis is not absolute,** and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects; mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. Long sleeves and trousers worn after dusk also provide protection.

### Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (preferably 2–3 weeks in the case of mefloquine) before travel into an endemic area (or if not possible at earliest opportunity up to 1 or 2 days before travel); *Malarone*\textsuperscript{c} or doxycycline prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*\textsuperscript{c} prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine and proguanil may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although it has been used for up to 3 years without undue problems). Doxycycline can be used for up to 2 years. *Malarone*\textsuperscript{c} is licensed for use for up to 28 days but can be used for up to 1 year (and possibly longer) with caution. Specialist advice should be sought for long-term prophylaxis.

### Return from malarial region

It is important to be aware that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness **particularly within 3 months** of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

**Children** Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. Weight is a better guide than age. If in doubt telephone centres listed on p. 402.

### Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas **without chloroquine resistance** proguanil 200 mg daily alone is recommended; in areas with chloroquine resistance, doxycycline or *Malarone*\textsuperscript{c} may be considered; the metabolism of doxycycline may be influenced by antiepileptics (see interactions: Appendix 1 [tetracyclines]).

### Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

### Renal impairment

**Avoidance (or dosage reduction)** of proguanil is recommended since it is excreted by the kidneys. *Malarone*\textsuperscript{c} should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73 m\textsuperscript{2}. Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate.
to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

**Pregnancy**  Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil, folic acid 5 mg daily should be given. The centres listed on p. 402 should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy. Malaria® should be avoided during pregnancy unless there is no suitable alternative.

**Breast-feeding**  Prophylaxis is required in breast-fed infants, although antimalarials are present in milk, the amounts are too variable to give reliable protection.

**Anticoagulants**  Travellers taking warfarin should begin chemoprophylaxis at least 1 week (2–3 weeks for mefloquine) before departure. The INR should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

### Specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice.

**Risk may vary in different parts of a country—check under all risk levels**

**Important**  Settled immigrants (or long-term visitors) to the UK may be unaware that they will have lost some of their immunity and also that the areas where they previously lived may now be malarious

### North Africa, the Middle East, and Central Asia

**Very low risk**  Risk very low in Algeria, Egypt (but low risk in El Faiyum, see below), Georgia (south-east, July–October), Kyrgyzstan (but low risk in south-west, see below), Libya, most tourist areas of Turkey (but low risk in Adana and border with Syria, see below), Uzbekistan (extreme south-east only):

chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever presents

**Low risk**  Risk low in Armenia (June–October), Azerbaijan (southern border areas, June–September), Egypt (El Faiyum only, June–October), Iran (northern border with Azerbaijan, May–October; variable risk in rural south-east provinces; see below), rural north Iraq (May–November), Kyrgyzstan (south-west, May–October), north border of Syria (May–October), Turkey (plain around Adana and east of there, border with Syria, March–November):

preferably

chloroquine or (if chloroquine not appropriate) proguanil hydrochloride

**Variable risk**  Risk variable and chloroquine resistance present in Afghanistan (below 2000 m, May–November), Iran (rural south-east provinces, March–November, see also Low Risk above), Oman (remote rural areas only), Saudi Arabia (south-west and rural areas of western region; no risk in Mecca, Medina, Jeddah, or high-altitude areas of Asir Province), Tajikistan (June–October), Yemen (no risk in Sana’a):

chloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) doxycycline

**Sub-Saharan Africa**

No chemoprophylaxis recommended for Cape Verde (some risk on São Tiago) and Mauritius (but avoid mosquito bites and consider malaria if fever presents)

**Very high risk**  Risk very high (or locally very high) and chloroquine resistance very widespread in Angola, Benin, Botswana (northern half, November–June), Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Comoros, Congo, Democratic Republic of the Congo (formerly Zaïre), Djibouti, Equatorial Guinea, Eritrea, Ethiopia (below 2000 m; no risk in Addis Ababa), Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Ivory Coast, Kenya, Liberia, Madagascar, Malawi, Mali, Mauritania (all year in south; July–October in north), Mozambique, Namibia (all year along Kavango and Kunene rivers; November–June in northern third), Niger, Nigeria, Principe, Rwanda, São Tomé, Senegal, Sierra Leone, Somalia, South Africa (low-altitude areas of Mpumalanga and Limpopo Provinces, Kruger National Park, and north-east KwaZulu-Natal as far south as Jozini), Sudan, Swaziland, Tanzania, Togo, Uganda, Zambia, Zimbabwe (all year in Zambezi valley; November–June in other areas below 1200 m; risk negligible in Harare and Bulawayo):

mefloquine or doxycycline or Malarone®

**Note**  In Zimbabwe and neighbouring countries, pyrimethamine with dapsone (also known as Deltaprim®) prophylaxis is used by local residents (sometimes with chloroquine)—this regimen is not recommended
### South Asia

**Low risk** Risk low in Bangladesh (but high risk in Chittagong Hill Tracts, see below), India (Kerala [southem states], Tamil Nadu, Karnataka, Southern Andhra Pradesh [including Hyderabad], Mumbai, Rajasthan [including Jaipur], Uttar Pradesh [including Agra], Har- yana, Uttaranchal, Himachal Pradesh, Jammu, Kashmir, Punjab, Delhi; variable risk in other areas, see below; high risk in Assam), Sri Lanka (but variable risk north of Vavuniya, see below):

- chloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) mefloquine or doxycycline or Malarone®

**Variable risk** Risk variable and chloroquine resistance usually moderate in southern districts of Bhutan, India (low risk in some areas, see above; high risk in Assam, see below), Nepal below 1500 m, especially Terai di- tricts; no risk in Kathmandu), Pakistan (below 2000 m), Sri Lanka (north of Vavuniya; low risk in other areas, see above):

- chloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) mefloquine or doxycycline or Malarone®

**High risk** Risk high and chloroquine resistance high in Bangladesh (only in Chittagong Hill Tracts; low risk in other areas, see above), India (Assam only; see also Low Risk and Variable Risk above):

- mefloquine or doxycycline or Malarone® or (if mefloquine, doxycycline, or Malarone® not appropriate) chloroquine + proguanil hydrochloride

### South-East Asia

**Very low risk** Risk very low in Bali, Brunei, Cambodia (Angkor Wat and Siem Reap, but no risk in Phnom Penh; substantial risk in other areas, see below; great risk in western provinces, see below), main tourist areas of China (but substantial risk in Yunnan and Hainan, see below; chloroquine prophylaxis appropriate for other remote areas), Hong Kong, Korea (both North and South), Malaysia (both East and West including Camer- on Highlands, but substantial risk in Sabah [except Kota Kinabalu], and variable risk in deep forests, see below), Singapore, Thailand (important: regional risk exists, see under Great Risk, below), Vietnam (cities, coast between Ho Chi Minh and Hanoi, and Mekong River until close to Cambodian border; substantial risk in other areas, see below):

- chloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) mefloquine or doxycycline or Malarone®

### Oceania

**Risk** Risk high and chloroquine resistance high in Papua New Guinea (below 1800 m), Solomon Islands, Vanuatu:

- doxycycline or mefloquine or Malarone®

### Central and South America and the Caribbean

**Very low risk** Risk very low in Jamaica:

- chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever present

### Variable to low risk** Risk variable to low in Argentina (rural areas along northern borders only), rural Belize (except Belize district), Costa Rica (Limon Province except Puerto Limon and northern canton of Pococci), Dominican Republic, El Salvador (Santa Ana province in west), Guatemala (below 1500 m), Haiti, Honduras, Mexico (states of Oaxaca and Chiapas), Nicaragua,
5.4.1 Antimalarials

**Artemether with lumefantrine**

Artemether with lumefantrine is licensed for the treatment of acute uncomplicated falciparum malaria.

**ARTEMETHER WITH LUMEFANTRINE**

**Indications**
treatment of acute uncomplicated falciparum malaria; treatment of benign malaria [unlicensed indication]

**Cautions**
- Electrolyte disturbances, concomitant use with other drugs known to cause QT-interval prolongation; monitor patients unable to take food (greater risk of recrudescence); interactions: Appendix 1 (artemether with lumefantrine)
- Driving
  - Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications**
- History of arrhythmias, of clinically relevant bradycardia, and of congestive heart failure accompanied by reduced left ventricular ejection fraction; family history of sudden death or of congenital QT interval prolongation

**Hepatic impairment**
- Manufacturer advises caution in severe impairment—monitor ECG and plasma-potassium concentration

**Renal impairment**
- Manufacturer advises caution in severe impairment—monitor ECG and plasma-potassium concentration

**Pregnancy**
- Toxicity in animal studies with artemether; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding**
- Manufacturer advises avoid breast-feeding for at least 1 week after last dose; present in milk in animal studies

**Side-effects**
- Abdominal pain, anorexia, diarrhoea, vomiting, nausea; palpitation, prolonged QT interval; cough, headache, dizziness, sleep disturbances, asthenia, paraesthesia; atrial fibrillation, myalgia, pruritus, rash; less commonly ataxia, hypoesthesia, and clonus

**Dose**
- Treatment of malaria, see p. 402

**Riamet® (Novartis)**
- Tablets, yellow, artemether 20 mg, lumefantrine 120 mg, net price 24-tab pack = £22.50. Label: 21, counselling, driving

**Note**
- Tablets may be crushed just before administration

---

**Chloroquine**

Chloroquine is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see specific recommendations by country, p. 405).

Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine, Malarone®, or Riamet® (for details, see p. 402). It is still recommended for the treatment of benign malarial parasitaemias (for details, see p. 403).

---

**Standby treatment**

Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

**Variable to high risk**
- Risk variable to high and chloroquine resistance present in rural areas of Bolivia (below 2500 m), Ecuador (below 1500 m; no malaria in Galapagos Islands and Guayaquil; see below for Esmeraldas Province), Panama (east of Panama Canal, Peru (rural areas east of the Andes and west of the Amazon basin area), Venezuela (northern coastal region), Brazil (throughout ‘Legal Amazon’ area, high risk south of and including Orinoco river and Amazon basin area, see below; Caracas free of malaria):

**High risk**
- Risk high and marked chloroquine resistance in Bolivia (Amazon basin area; see also variable to high risk above), Brazil (throughout ‘Legal Amazon’ area which includes the Amazon basin area, Mato Grosso and Maranhao only; elsewhere very low risk—no chemoprophylaxis), Colombia (most areas below 800 m), Ecuador (Esmeraldas Province; variable to high risk in other areas, see above), French Guiana, all interior regions of Guyana, Peru (Amazon basin area), Suriname (except Paramaribo and coast), Venezuela (Amazon basin area, areas south of and including Orinoco river):

---

**Chloroquine or if chloroquine not appropriate** proguanil hydrochloride

---

**chloroquine + proguanil hydrochloride or if chloroquine + proguanil not appropriate** mefloquine or doxycycline or Malarone®

---

**High risk**
- Risk high and marked chloroquine resistance in Bolivia (below 2500 m), Ecuador (below 1500 m; no malaria in Galapagos Islands and Guayaquil; see below for Esmeraldas Province), Panama (east of Panama Canal, Peru (rural areas east of the Andes and west of the Amazon basin area), Venezuela (north of Orinoco river; high risk south of and including Orinoco river and Amazon basin area, see below; Caracas free of malaria):

---

**Variable to high risk**
- Risk variable to high and chloroquine resistance present in rural areas of Bolivia (below 2500 m), Ecuador (below 1500 m; no malaria in Galapagos Islands and Guayaquil; see below for Esmeraldas Province), Panama (east of Panama Canal, Peru (rural areas east of the Andes and west of the Amazon basin area), Venezuela (north of Orinoco river; high risk south of and including Orinoco river and Amazon basin area, see below; Caracas free of malaria):

---

**chloroquine or if chloroquine not appropriate** proguanil hydrochloride

---

**Variable to high risk**
- Risk variable to high and chloroquine resistance present in rural areas of Bolivia (below 2500 m), Ecuador (below 1500 m; no malaria in Galapagos Islands and Guayaquil; see below for Esmeraldas Province), Panama (east of Panama Canal, Peru (rural areas east of the Andes and west of the Amazon basin area), Venezuela (north of Orinoco river; high risk south of and including Orinoco river and Amazon basin area, see below; Caracas free of malaria):

---

**chloroquine + proguanil hydrochloride or if chloroquine + proguanil not appropriate** mefloquine or doxycycline or Malarone®

---

**Standby treatment**
- Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

---

**Chloroquine**
- Chloroquine is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see specific recommendations by country, p. 405).

Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine, Malarone®, or Riamet® (for details, see p. 402). It is still recommended for the treatment of benign malarial parasitaemias (for details, see p. 403).
CHLOROQUINE

**Indications**  chemoprophylaxis and treatment of malaria; rheumatoid arthritis and lupus erythematosus (section 10.1.3)

**Cautions**  may exacerbate psoriasis; neurological disorders (avoid for prophylaxis if history of epilepsy; see notes above); may aggravate myasthenia gravis; severe gastro-intestinal disorders; G6PD deficiency (see section 9.1.5); ophthalmic examination and long-term therapy, see under Chloroquine, section 10.1.3; avoid concurrent therapy with hepatotoxic drugs—other interactions: Appendix 1 (chloroquine and hydroxychloroquine)

**Hepatic impairment**  use with caution in moderate to severe impairment

**Renal impairment**  manufacturers advise caution; see also Prophylaxis Against Malaria, p. 404

**Pregnancy**  benefit of prophylaxis and treatment in malaria outweighs risk; see also Benign Malaria (treatment), p. 404 and Prophylaxis Against Malaria, p. 405

**Breast-feeding**  amount in milk probably too small to be harmful; see also Prophylaxis Against Malaria, p. 405

**Side-effects**  gastro-intestinal disturbances, headache; also hypotension, convulsions, visual disturbances, depigmentation or loss of hair, skin reactions (rashes, pruritus); rarely, bone-marrow suppression, hypersensitivity reactions such as urticaria and angioedema; other side-effects (not usually associated with malaria prophylaxis or treatment), see under Chloroquine, section 10.1.3; very toxic in overdose—immediate advice from poisons centres essential (see also p. 37)

**Dose**

- **Note**  Doses expressed as chloroquine base
- **Prophylaxis of malaria, preferably started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above), 310 mg once weekly:** INFANT up to 12 weeks body-weight under 6 kg, 37.5 mg once weekly; 12 weeks–1 year body-weight 6–10 kg, 75 mg once weekly; CHILD 1–4 years body-weight 10–16 kg, 112.5 mg once weekly; 4–8 years body-weight 16–25 kg, 150 mg once weekly (or 155 mg once weekly if tablets used); 8–13 years body-weight 25–45 kg, 225 mg once weekly (or 232.5 mg once weekly if tablets used); over 13 years body-weight over 45 kg, adult dose
- **Treatment of benign malaria, see p. 403**

**Counselling**  Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if illness within 1 year and especially within 3 months of return. For details, see notes above

- **Note**  Chloroquine doses in BNF may differ from those in product literature

1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed

2. Malaron® (Wallace Mfg)

- **Syrup**, chloroquine phosphate 80 mg/5 mL (≡ chloroquine base 50 mg/5 mL), net price 75 mL = £8.75. Label: 5, counselling, prophylaxis, see above

3. Nivaquine® (Sanofi-Aventis)

- **Syrup**, golden, chloroquine sulphate 68 mg/5 mL (≡ chloroquine base 50 mg/5 mL), net price 100 mL = £4.60. Label: 5, counselling, prophylaxis, see above

**Mefloquine**

Mefloquine is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant falciparum malaria (for details, see specific recommendations by country, p. 405).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of benign malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

**MEFLOQUEINE**

**Indications**  chemoprophylaxis of malaria, treatment of malaria, see notes above

**Cautions**  cardiac conduction disorders; epilepsy (avoid for prophylaxis); not recommended in infants under 3 months (5 kg); interactions: Appendix 1 (mefloquine)

- **Driving**  Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may persist for up to 3 weeks

**Contra-indications**  hypersensitivity to quinine; avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions

**Hepatic impairment**  avoid for prophylaxis in severe liver disease

**Pregnancy**  manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in animal studies), but see also p. 405

**Breast-feeding**  present in milk but risk to infant minimal; see also p. 405

**Side-effects**  nausea, vomiting, dyspepsia, abdominal pain, diarrhoea; headache, dizziness, sleep disturbances; less frequently: anorexia, Bradycardia, fatigue, abnormal dreams, fever, tinnitus, and neuropsychiatric reactions (including sensory and motor neuropathies, tremor, ataxia, anxiety, depression, panic attacks, agitation, hallucinations, psychosis, convulsions); rarely suicidal ideation; very rarely pneumonitis; also reported, circulatory disorders (including hypotension and hypertension), chest pain, tachycardia, palpitation, cardiac conduction disorders, oedema, dyspnoea, encephalopathy, leucopenia,
leucocytosis, thrombocytopenia, muscle weakness, myalgia, arthralgia, visual disturbances, vestibular disorders, rash (including Stevens-Johnson syndrome), pruritus, and alopecia

**Dose**
- Prophylaxis of malaria, preferably started **2½ weeks** before entering endemic area and continued for **4 weeks** after leaving (see notes above). ADULT and CHILD body-weight over 45 kg, 250 mg once weekly; body-weight 6–16 kg, 62.5 mg once weekly; body-weight 16–25 kg, 125 mg once weekly; body-weight 25–45 kg, 187.5 mg once weekly
- Treatment of malaria, see notes above

**Counselling** Inform travellers about adverse reactions of mefloquine and, if they occur, to seek medical advice on antimalarials before the next dose is due. Also warn travellers about the importance of avoiding mosquito bites, of taking prophylaxis regularly, and of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above.

**Note** Mefloquine doses in BNF may differ from those in product literature

**PRIMAQUINE**

**Indications** adjunct in the treatment of *Plasmodium vivax* and *P. ovale* malaria (eradication of liver stages)

**Cautions** G6PD deficiency (test blood, see under Benign Malaria - treatment). Systemic diseases associated with glucocorticoid-induced acne (e.g. rheumatoid arthritis, lupus erythematosus);

**Interactions:** Appendix 2 (primaquine)

**Pregnancy** risk of neonatal haemolysis and mehaemoglobinemia in third trimester; see also notes above

**Breast-feeding** no information available; theoretical risk of haemolysis in G6PD-deficient infants

**Side-effects** nausea, vomiting, anorexia, abdominal pain; less commonly methaemoglobinaemia, haemolytic anaemia especially in G6PD deficiency, leucopenia

**Dose**
- Treatment of benign malaria, see p. 403

**Proguanil**

**Dose**
- Proguanil used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

**PROGUANIL HYDROCHLORIDE**

**Indications** chemoprophylaxis of malaria

**Cautions** interactions: Appendix 1 (proguanil)

**Renal impairment** 100 mg once daily if eGFR 20–60 mL/minute/1.73 m²; 50 mg on alternate days if eGFR 10–20 mL/minute/1.73 m²; 50 mg once weekly if eGFR less than 10 mL/minute/1.73 m² (increased risk of haematological toxicity)

**Pregnancy** benefit of prophylaxis in malaria outweighs risk; adequate folate supplements should be given to mother; see also p. 405

**Breast-feeding** amount in milk probably too small to be harmful when used for malaria prophylaxis; see also p. 405

**Side-effects** mild gastric intolerance, diarrhoea, and constipation; occasionally mouth ulcers and stomatitis; very rarely cholestasis, vasculitis, skin reactions, and hair loss

**Dose**
- Prophylaxis of malaria, preferably started **1 week** before entering endemic area and continued for **4 weeks** after leaving (see notes above), **250 mg** once daily; **125 mg** once daily; **62.5 mg** once daily; **50 mg** once daily; **25 mg** once daily; **12 weeks–1 year** body-weight **6–16 kg**; **10 kg**; **16–25 kg**; **25 mg** once daily; **body-weight over 45 kg**, adult dose

**Counselling** Inform travellers about the importance of avoiding mosquito bites, of taking prophylaxis regularly, and of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above.

**Note** Proguanil doses in BNF may differ from those in product literature

**ATOVQUONE**

**Indications** treatment of acute uncomplicated falciparum malaria and prophylaxis of falciparum malaria, particularly where resistance to other antimalarials is prescribed

1. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

2. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed

---

**BNF 61**

**5.4.1 Antimalarials**

---

**BNF 61 Antimalarials**

---

**Primaquine**

Primaquine is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment (for details, see p. 405).

**Indications**

**Cautions**

**Interactions**: Appendix 1 (primaquine)

**Pregnancy** risk of neonatal haemolysis and mehaemoglobinemia in third trimester; see also notes above

**Breast-feeding** no information available; theoretical risk of haemolysis in G6PD-deficient infants

**Side-effects** nausea, vomiting, anorexia, abdominal pain; less commonly methaemoglobinaemia, haemolytic anaemia especially in G6PD deficiency, leucopenia

**Dose**
- Treatment of benign malaria, see p. 403

**Primaquine** (Non-proprietary)

Tablets, primaquine (as phosphate) 7.5 mg or 15 mg
Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 988

**Proguanil**

Proguanil is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria. (For details, see specific recommendations by country; p. 405).
drugs suspected; treatment of benign malaria [unlicensed indication]

**Cautions** diarrhoea or vomiting (reduced ability of atovaquone); efficacy not embedded in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure); **interractions:** see Appendix 1 (proguanil, atovaquone)

**Renal impairment** avoid for malaria prophylaxis (and following) if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** use only if no suitable alternative available; see also p. 405

**Side-effects** abdominal pain, nausea, vomiting, diarrhoea; cough; headache, dizziness, insomnia, abnormal dreams, depression, anorexia, fever, rash, pruritus; less frequently stomatitis, palpitation, anxiety, blood disorders, hyponatraemia, and hair loss; also reported, hepatisis, cholestasis, tachycardia, hallucinations, seizures, vasculitis, mouth ulcers, and Stevens-Johnson syndrome

**Dose**

- **See preparations**
  - **Counselling** Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 3 months of return. For details, see notes above

### Malarone® (GSK)

<table>
<thead>
<tr>
<th><strong>Tablets</strong> <em>(standard)</em>, pink, f/c, proguanil hydrochloride 100 mg, atovaquone 250 mg. Net price 12-tab pack = £25.21. Label: 21, counselling, prophylaxis, see above</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Dose</strong> prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 1 week after leaving, ADULT and CHILD over 40 kg, 1 tablet daily</td>
</tr>
<tr>
<td><strong>Treatment of malaria,</strong> ADULT and CHILD body-weight over 40 kg, 4 tablets once daily for 3 days; CHILD body-weight 11–21 kg 1 tablet daily for 3 days, body-weight 21–31 kg 2 tablets once daily for 3 days; body-weight 31–40 kg 3 tablets once daily for 3 days</td>

<tr>
<td><strong>Treatment of malaria,</strong> CHILD body-weight 5–9 kg, 2 tablets once daily for 3 days; body-weight 9–11 kg, 3 tablets once daily for 3 days; body-weight 11 kg and over use Malarone® <em>(standard)</em> tablets</td>
</tr>
</tbody>
</table>
| **Note** Tablets may be crushed and mixed with food or milky drink just before administration

---

**Pyrimethamine**

Pyrimethamine should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the prophylaxis of malaria, but it can be used in the treatment of falciparum malaria with (or following) quinine.

---

1 Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

### Pyrimethamine

**Indications** malaria (but used only in combined preparations incorporating sulfadoxine); toxoplasmosis—section 5.4.7

**Cautions** blood counts required with prolonged treatment; history of seizures—avoid large loading doses; **interractions:** Appendix 1 (pyrimethamine)

**Hepatic impairment** manufacturer advises caution

**Pregnancy** theoretical teratogenic risk in **first trimester** (folate antagonist); adequate folate supplements should be given to mother

**Breast-feeding** significant amount in milk—avoid administration of other folate antagonists to infant; avoid breast-feeding during toxoplasmosis treatment

**Side-effects** depression of haematopoiesis with high doses, rashes, insomnia

**Dose**

- Malaria, no dose stated because not recommended alone, see Pyrimethamine with Sulfadoxine below
- Toxoplasmosis, section 5.4.7

**Daraprim® (GSK)**

| **Tablets,** scored, pyrimethamine 25 mg. Net price 30-tab pack = £2.60 |

---

**Pyrimethamine with Sulfadoxine**

**Indications** adjunct to quinine in treatment of *Plasmodium falciparum* malaria; **not** recommended for prophylaxis

**Cautions** see under Pyrimethamine and under *Co-trimoxazole* (section 5.1.8); not recommended for prophylaxis (severe side-effects on long-term use); **interractions:** Appendix 1 (pyrimethamine, sulfonamides)

**Contra-indications** see under Pyrimethamine and under *Co-trimoxazole* (section 5.1.8); sulfonamide allergy

**Pregnancy** possible teratogenic risk in **first trimester** (pyrimethamine a folate antagonist); in **third trimester**—risk of neonatal haemolysis and methaemoglobinemia; fear of increased risk of kernicterus in neonates appears to be unfounded; see also p. 403

**Breast-feeding** small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfadoxine)

**Side-effects** see under Pyrimethamine and under *Co-trimoxazole* (section 5.1.8); pulmonary infiltrates (e.g. eosinophilic or allergic alveolitis) reported—discontinue if cough or shortness of breath

**Dose**

- Treatment of falciparum malaria, see p. 402
- Prophylaxis, not recommended by UK malaria experts

**Pyrimethamine with sulfadoxine** *(Non-proprietary)*

| **Tablets,** scored, pyrimethamine 25 mg, sulfadoxine 500 mg, net price 3-tab pack = 74p |

**Note** Also known as Fansidar®

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988
Quinine

Quinine is not suitable for the prophylaxis of malaria. Quinine is used for the treatment of falciparum malaria or if the infective species is not known or if the infection is mixed (for details see p. 402).

Doxycycline (section 5.1.3) is used for the treatment of falciparum malaria (for details see p. 402).

DOXYCYCLINE

Indications prophylaxis of malaria; adjunct to quinine in treatment of Plasmodium falciparum malaria; see also section 5.1.3

Cautions section 5.1.3

Contra-indications section 5.1.3

Hepatic impairment section 5.1.3

Renal impairment section 5.1.3

Pregnancy section 5.1.3

Breast-feeding section 5.1.3

Side-effects section 5.1.3

Dose

- Prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 4 weeks after leaving (see notes above), ADULT and child over 12 years, 100 mg once daily
- Treatment of falciparum malaria, see p. 402

Preparations

Section 5.1.3

5.4.2 Amoebicides

Metronidazole is the drug of choice for acute invasive amoebic dysentery since it is very effective against vegetative forms of Entamoeba histolytica in ulcers; it is given in an adult dose of 800 mg three times daily for 5 days. Tinidazole is also effective. Metronidazole and tinidazole are relatively ineffective against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with E. histolytica cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but in malaria benefit of treatment outweighs risk; see also section 5.1.3

Preparations

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

Note Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

Tetracyclines

Doxycycline (section 5.1.3) is used for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternate to mefloquine or Malarone® (for details, see specific recommendations by country, p. 405).
412 5.4.3 Trichomonacides

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid

**Side-effects** flatulence, vomiting, urticaria, pruritus

**Dose**
- 500 mg every 8 hours for 10 days; **CHILD** body-weight over 25 kg, 20 mg/kg daily in 3 divided doses for 10 days; body-weight under 25 kg, see **BNF for Children**

See also notes above

Diloxanide (Sovereign)
- Tablets, diloxanide furoate 500 mg, net price 30-tab pack = £93.50. Label: 9

### METRONIDAZOLE

**Indications** see under Dose below; anaerobic infections, section 5.1.11  
**Cautions** section 5.1.11  
**Hepatic impairment** section 5.1.11  
**Pregnancy** section 5.1.11  
**Breast-feeding** section 5.1.11  
**Side-effects** section 5.1.11  

**Dose**
- **By mouth**, invasive intestinal amoebiasis, extra-intestinal amoebiasis (including liver abscess), 800 mg every 8 hours for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection); **CHILD** 1–3 years 200 mg every 8 hours; 3–7 years 200 mg every 6 hours; 7–10 years 400 mg every 8 hours

Urogenital trichomoniasis, 200 mg every 8 hours for 7 days or 400–500 mg every 12 hours for 5–7 days, or 2 g as a single dose; **CHILD** 1–3 years 30 mg every 8 hours for 7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours

Giardiasis, 2 g daily for 3 days or 400 mg 3 times daily for 5 days or 500 mg twice daily for 7–10 days; **CHILD** 1–3 years 500 mg daily for 3 days; 3–7 years 600–800 mg daily; 7–10 years 1 g daily

### MEPACRINE HYDROCHLORIDE

**Indications** giardiasis; discoid lupus erythematosus (Antimalarials, section 10.1.3)

**Cautions** hepatic impairment, elderly, history of psychosis; avoid in psoriasis; **interactions**: Appendix 1 (mepacrine)

**Side-effects** gastro-intestinal disturbances; dizziness, headache; with large doses nausea, vomiting and occasionally transient acute toxic psychosis and CNS stimulation; on prolonged treatment yellow discoloration of skin and urine, chronic dermatoses (including severe exfoliative dermatitis), hepatitis, aplastic anaemia; also reported blue/black discoloration of palate and nails and corneal deposits with visual disturbances

**Dose**
- Giardiasis (unlicensed), 100 mg every 8 hours for 5–7 days

**Mepacrine Hydrochloride**
- Tablets, mepacrine hydrochloride 100 mg. Label: 4, 9, 14, 21

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

### TINIDAZOLE

**Indications** see under Dose below; anaerobic infections, section 5.1.11

**Cautions** section 5.1.11

**Pregnancy** section 5.1.11

**Breast-feeding** section 5.1.11

**Side-effects** section 5.1.11

**Dose**
- Intestinal amoebiasis, 2 g daily for 2–3 days; **CHILD** 50–60 mg/kg daily for 3 days

- Amoebic involvement of liver, 1.5–2 g daily for 3–6 days; **CHILD** 50–60 mg/kg daily for 5 days

- Urogenital trichomoniasis and giardiasis, single 2 g dose; **CHILD** single dose of 50–75 mg/kg (repeated once if necessary)

### Preparations
- Section 5.1.11

### 5.4.5 Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

**Sodium stibogluconate**, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dose is 20 mg/kg daily (max. 850 mg) by intramuscular or intravenous injection for 28 days in visceral leishmaniasis and for 20 days in cutaneous infection; the dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intraleisional injections of sodium stibogluconate under specialist supervision.

**Amphoterin** is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphoterin (Ambisome™—section 5.2) at a dose of 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg or at a dose of 3 mg/kg for 5 consecutive days followed by a single dose of...
SODIUM STIBOGLUCONATE

Indications leishmaniasis

Cautions intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain; mucocutaneous disease (see below); monitor ECG before and during treatment; heart disease (withdraw if conjugation disturbances occur); treat intercurrent infection (e.g. pneumonia)

Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid

Hepatic impairment use with caution

Renal impairment avoid in significant impairment

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding amount probably too small to be harmful

Side-effects anorexia, nausea, vomiting, abdominal pain, diarrhoea; ECG changes; coughing (see Cautions); headache, lethargy; arthralgia, myalgia; rarely jaundice, flushing, bleeding from nose or gum, substernal pain (see Cautions), vertigo, fever, sweating, and rash; also reported pancreatitis and anaphylaxis; pain and thrombosis on intravenous administration, intramuscular injection also painful

Dose

- See notes above

Pentostam® (GSK)

Injection, sodium stibogluconate equivalent to pentavalent antimony 100 mg/mL. Net price 100-mL bottle = £66.43

Note Injection should be filtered immediately before administration using a filter of 5 microns or less

5.4.6 Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

5.4.7 Drugs for toxoplasmosis

Most infections caused by Toxoplasma gondii are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioido-retinitis), and those who are immunosuppressed. Toxoplasmal encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine and sulfadiazine, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin or clarithromycin or azithromycin. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus. Spiramycin (unlicensed) (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) may reduce the risk of transmission of maternal infection to the fetus.

5.4.8 Drugs for pneumocystis pneumonia

Pneumonia caused by Pneumocystis jirovecii (Pneumocystis carinii) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

Mild to moderate disease Co-trimoxazole (section 5.1.8) in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone 100 mg daily (section 5.1.10) with trimethoprim 5 mg/kg every 6–8 hours (section 5.1.8) is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin 600 mg by mouth every 8 hours (section 5.1.6) and primaquine 30 mg daily by mouth (section 5.4.1) is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease Co-trimoxazole (section 5.1.8) in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isethionate given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isethionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion. Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia (see Adjunctive Therapy below).

Adjunctive therapy In moderate to severe infections associated with HIV infection, prednisolone 50–80 mg daily is given by mouth for 5 days (alternatively, hydrocortisone may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.
Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given in a dose of 960 mg daily or 960 mg on alternate days (3 times a week); the dose may be reduced to co-trimoxazole 480 mg daily to improve tolerance.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone 100 mg daily (section 5.1.10) can be used. Atovaquone 750 mg twice daily has also been used for prophylaxis [unlicensed indication].

ATOVAQUONE

Indications treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients intolerant of co-trimoxazole

Cautions initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy); other causes of pulmonary disease should be sought and treated; elderly; interactions: Appendix 1 (atovaquone)

Hepatic impairment manufacturer advises caution—monitor more closely

Renal impairment manufacturer advises caution—monitor more closely

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid unless essential

Side-effects nausea, diarrhoea, vomiting; headache, insomnia; fever; anaemia, neutropenia, hypotension; rash, pruritus; also reported, Stevens-Johnson syndrome

Dose

- 750 mg twice daily with food (particularly high fat) for 21 days; CHILD not recommended

Wellvone® (GSK) Suspension, sugar-free, atovaquone 750 mg/5 mL, net price 226 mL (tutti-frutti-flavoured) = £405.31. Label: 21

With progurani hydrochloride See section 5.4.1

PENTAMIDINE ISETIONATE

Indications see under Dose (should only be given by specialists)

Cautions risk of severe hypotension following administration (monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded; patient should be lying down when receiving drug parenterally); hypokalaemia, hypomagnesaemia, coronary heart disease, bradycardia, history of ventricular arrhythmias, concomitant use with other drugs which prolong QT-interval, hypertension or hypotension; hyperglycaemia or hypoglycaemia; leucopenia, thrombocytopenia, or anaemia; carry out laboratory monitoring according to product literature; care required to protect personnel during handling and administration; interactions: Appendix 1 (pentamidine isetionate)

Hepatic impairment manufacturer advises caution—monitor more closely

Renal impairment reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in life-threatening infection, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in less severe infection, use 4 mg/kg on alternate days for at least 14 doses

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid unless essential—no information available

Side-effects severe reactions, sometimes fatal, due to hypotension, hypoglycaemia, pancreatitis, and arrhythmias; also leucopenia, thrombocytopenia, acute renal failure, hypocalcaemia; also reported: azotaemia, abnormal liver-function tests, anaemia, hyperkalaemia, nausea and vomiting, dizziness, syncope, flushing, hyperglycaemia, rash, and taste disturbances; Stevens-Johnson syndrome reported; on inhalation, bronchoconstriction (may be prevented by prior use of bronchodilators), cough, and shortness of breath, discomfort, pain, induration, abscess formation, and muscle necrosis at injection site

Dose

- Treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia, by intravenous infusion, 4 mg/kg once daily for at least 14 days

Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia, by inhalation of nebulised solution (using suitable equipment—consult product literature), 300 mg every 4 weeks or 150 mg every 2 weeks [unlicensed for primary prevention]

- Visceral leishmaniasis (kala-azar, section 5.4.5), by deep intramuscular injection, 3–4 mg/kg on alternate days to max. total of 10 injections; course may be repeated if necessary

- Cutaneous leishmaniasis, by deep intramuscular injection, 3–4 mg/kg once or twice weekly until condition resolves (but see also section 5.4.5)

- Trypanosomiasis, by deep intramuscular injection or intravenous infusion, 4 mg/kg daily or on alternate days to total of 7–10 injections

Note Direct intravenous injection should be avoided whenever possible and never given rapidly; intramuscular injections should be deep and preferably given into the buttock

Pentacarinat® (Sanofi-Aventis) Injection, powder for reconstitution, pentamidine isetionate, net price 300-mg vial = £30.45

Nebuliser solution, pentamidine isetionate, net price 300-mg bottle = £32.15

Caution in handling Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature
5.5 Anthelmintics

5.5.1 Drugs for threadworms (pinworms, Enterobius vermicularis)

Anthelmintics are effective in threadworm infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole is the drug of choice for treating threadworm infection in patients of all ages over 2 years. It is the drug of choice for treating threadworm, roundworm, whipworm, and non-filarial hookworm infections. It is available in combination with sennosides in a single-dose preparation.

Note: The package insert in the Vermox® pack includes the statement that it is not suitable for women known to be pregnant or children under 2 years.

5.5.2 Ascaricides

5.5.3 Drugs for tapeworm infections

5.5.4 Drugs for hookworms

5.5.5 Schistosomicides

5.5.6 Filariicides

5.5.7 Drugs for cutaneous larva migrans

5.5.8 Drugs for strongyloidiasis

Advice on prophylaxis and treatment of helminth infections is available from:

- Birmingham (0121) 424 0357
- Scottish Centre for Infection and Environmental Health (registered users of Travax only) (0141) 300 1100 (weekdays 2–4 p.m. only)
- Liverpool (0151) 708 9393
- London 0845 155 5000 (treatment)

5.5.1 Drugs for threadworms

Indications threadworm and roundworm infections

Cautions
- epilepsy; packs on sale to the general public carry a warning to avoid in epilepsy, or in liver or kidney disease, and to seek medical advice in pregnancy
- Hepatic impairment manufacturer advises avoid
- Renal impairment use with caution; avoid in severe renal impairment; risk of neurotoxicity
- Pregnancy not known to be harmful but manufacturer advises avoid in first trimester
- Breast-feeding present in milk—manufacturer advises avoid breast-feeding for 8 hours after dose (express and discard milk during this time)
- Side-effects nausea, vomiting, colic, diarrhoea, allergic reactions including urticaria, bronchospasm, and rare reports of arthralgia, fever, Stevens-Johnson syndrome and angioedema; rarely dizziness, muscular incoordination (‘worm wobble’); drowsiness, nystagmus, vertigo, blurred vision, confusion and chronic contractions in patients with neurological or renal abnormalities

Dose
- See under Preparation, below

With sennosides

For cautions, contra-indications, side-effects of senna see section 1.6.2

5.5.1 Drugs for threadworms

1. Mebendazole (Non-proprietary) (Vermox®)

Tablets, chewable, mebendazole 100 mg

2. Piperazine (Non-proprietary) (Pipersen®)

Tablets, orange, scored, chewable, mebendazole 100 mg. Net price 6-tab pack = £1.36

Oral suspension, mebendazole 100 mg/5 mL (banana-flavoured). Net price 30 mL = £1.59
5.5.2 Ascaricides
(common roundworm infections)

Mebendazole (section 5.5.1) is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice; the usual dose is 100 mg twice daily for 3 days or 500 mg as a single dose [unlicensed single dose].

Levamisole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is an alternative when mebendazole cannot be used. It is very well tolerated; mild nausea or vomiting has been reported in about 1% of treated patients; it is given as a single dose of 120–150 mg in adults.

Piperazine may be given in a single adult dose, see Piperazine, above.

5.5.3 Drugs for tapeworm infections

Taenicides

Niclosamide [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is as effective as niclosamide and is given as a single dose of 5–10 mg/kg after a light breakfast (a single dose of 25 mg/kg for *Hymenolepis nana*).

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated.

Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

5.5.4 Drugs for hookworms
(ancylostomiasis, necatoriasis)

Hookworms live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole (section 5.5.1) has a useful broad-spectrum activity and is effective against hookworms; the usual dose is 100 mg twice daily for 3 days. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) given as a single dose of 400 mg, is an alternative.

5.5.5 Schistosomicides
(bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. The dose is 20 mg/kg followed after 4–6 hours by one further dose of 20 mg/kg (20 mg/kg given 3 times on one day for *S. japonicum* infections). No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Hycanthone, lucanthone, niridazole, oxamniquine, and sodium stibogluconate have now been superseded.

5.5.6 Filaricides

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions treatment is commenced with a dose of diethylcarbamazine citrate 1 mg/kg on the first day and increased gradually over 3 days to 6 mg/kg daily in divided doses for *Loa loa*; this dosage is maintained for a further period. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is very effective in onchocerciasis and it is now the drug of choice. A single dose of 150 micrograms/kg by mouth produces a prolonged reduction in microfilarial levels. Retreatment at intervals of 6 to 12 months depending on symptoms must be given until the adult worms die out. Reactions are usually slight and most commonly take the form of temporary aggravation of itching and rash. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.
5.5.7 Drugs for cutaneous larva migrans
(creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical thiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or thiabendazole (thiabendazole) by mouth [all unlicensed] and available from ‘special-order’ manufacturers or specialist importing companies, see p. 988).

5.5.8 Drugs for strongyloidiasis

Adult Strongyloides stercoralis live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) in a dose of 200 micrograms/kg daily for 2 days is the treatment of choice for chronic Strongyloides infection. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is an alternative given in a dose of 400 mg twice daily for 3 days, repeated after 3 weeks if necessary.
Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

**Type 1 diabetes**, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

**Type 2 diabetes**, (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of the anti-obesity drug orlistat (section 4.5.1) may be considered in obese patients.

### Treatment of diabetes
Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications (see below); tight control of diabetes is essential.

Diabetes is a strong risk factor for cardiovascular disease (section 2.12). Other risk factors for cardiovascular disease such as smoking (section 4.10.2), hypertension (section 2.5), obesity (section 4.5), and hyperlipidaemia...
(section 2.12) should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (section 2.5.5.1), low-dose aspirin (section 2.9) and a lipid-regulating drug (section 2.12).

**Prevention of diabetic complications** Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy may occur when normalising blood-glucose concentration. For reference to the use of an ACE inhibitor or an angiotensin-II receptor antagonist in the management of diabetic nephropathy, see section 6.1.5.

A measure of the total glycosylated (or glycated) haemoglobin (HbA$_1c$) or a specific fraction (HbA$_1$) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA$_1c$ of 48–59 mmol/mol (6.5–7.5%) or less (reference range 20–42 mmol/mol or 4–6%) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA$_1c$ concentration at 48 mmol/mol (6.5%) or less. HbA$_1c$ should be measured every 3–6 months.

---

**Measurement of HbA$_1c$**

HbA$_1c$ values currently expressed as a percentage, are aligned to the assay used in the Diabetes Control and Complications Trial (DCCT). A new standard, specific for HbA$_1c$, has been created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC), which expresses HbA$_1c$ values in mmol of glycosylated haemoglobin per mol of haemoglobin. UK laboratories now express results in both IFCC-standardised units (mmol/mol) and DCCT-aligned units (%). From 1 June 2011, results will only be reported in IFCC-standardised units.

**Equivalent values**

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA$_1c$, and can be used to assess control over short periods of time, particularly when HbA$_1c$ monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation) (see also section 2.5).

**Driving** Drivers with diabetes are required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition if they are treated with insulin or if they are treated with oral antidiabetic drugs and also have complications. Detailed guidance on eligibility to drive is available from the DVLA (www.dvla.gov.uk/medical.aspx). Driving is not permitted when hypoglycaemic awareness is impaired or frequent hypoglycaemic episodes occur.

Drivers need to be particularly careful to avoid hypoglycaemia (see also above) and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals; these precautions may also be necessary for drivers taking oral antidiabetic drugs who are at particular risk of hypoglycaemia. Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition;
- eat or drink a suitable source of sugar;
- wait until recovery is complete before continuing journey; recovery may take 15 minutes or longer and should preferably be confirmed by checking blood-glucose concentration.

---

**Endocrine system**

**6.1.1 Insulins**

**6.1.1.1 Short-acting insulins**

**6.1.1.2 Intermediate- and long-acting insulins**

**6.1.1.3 Hypodermic equipment**

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semi-synthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials. Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; lipodystrophy may occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.
Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:

- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is required by almost all children with diabetes. It is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. For advice on use of oral antidiabetic drugs in the management of diabetes in pregnancy, see section 6.1.2.

Management of diabetes with insulin

The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsolescent and to avoid disabling hypoglycaemia; close co-operation is needed between the patient and the medical team because good control reduces the risk of complications.

Insulin preparations can be divided into 3 types:

- those of short duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart, insulin glulisine, and insulin lispro (section 6.1.1.1);
- those with an intermediate action, e.g. isophane insulin (section 6.1.1.2); and
- those whose action is slower in onset and lasts for long periods, e.g. protamine zinc insulin, insulin detemir, and insulin glargine (section 6.1.1.2).

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive post-prandial hyperglycaemia. The dose of insulin is increased gradually according to the patient’s individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty. Requirements may be decreased in those with certain endocrine disorders (e.g. Addison’s disease, hypopituitarism), or in coeliac disease.

Examples of recommended insulin regimens

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals
- With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
- Intermediate-acting or long-acting insulin, once or twice daily
- With or without short-acting insulin or rapid-acting insulin before meals;
- Continuous subcutaneous insulin infusion (see below).

Hepatic impairment

Insulin requirements may be decreased in patients with hepatic impairment.

Renal impairment

Insulin requirements may fall in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

Pregnancy and breast-feeding

During pregnancy and breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy. The short-acting insulin analogues, insulin aspart and insulin lispro, are not known to be harmful, and may be used during pregnancy and lactation. The safety of long-acting insulin analogues in pregnancy has not been established, therefore isophane insulin is recommended where longer-acting insulins are needed.

Insulin administration

Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens') (section 6.1.1.3), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form.

For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

Short-acting injectable insulins (soluble insulin, insulin aspart, insulin glulisine, and insulin lispro) can also be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
- whose glycaemic control remains inadequate (HbA1c over 8.5%) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

Soluble insulin by the intravenous route is reserved for urgent treatment, e.g. in diabetic ketoacidosis, and for fine control in serious illness and in the peri-operative period (see under Diabetes and Surgery, below).

**Units**

The word ‘unit’ should not be abbreviated.

**Monitoring**

Many patients now monitor their own blood-glucose concentrations (section 6.1.6). Since blood-glucose concentration varies substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia. It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals), while accepting that on occasions, for brief periods, it will be above these values; strenuous efforts should be made to prevent the blood-glucose concentration from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

**Hypoglycaemia**

Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulins; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

**Diabetes and surgery**

Perioperative control of blood-glucose concentrations in patients with type 1 diabetes is achieved via an adjustable, continuous, intravenous infusion of insulin. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these patients; in general, the following steps should be followed:

- Give an injection of the patient’s usual insulin on the night before the operation;
- Early on the day of the operation, start an intravenous infusion of glucose containing potassium chloride (provided that the patient is not hyperka-laemic) and infuse at a constant rate appropriate to the patient’s fluid requirements (usually 125 mL per hour); make up a solution of soluble insulin in sodium chloride 0.9% and infuse intravenously using a syringe pump piggy-backed to the intravenous infusion. Glucose and potassium infusions, and insulin infusions should be made up according to locally agreed protocols;
- The rate of the insulin infusion should be adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols. Other factors affecting the rate of infusion include the patient’s volume depletion, cardiac function, and age.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetica) and those with hyperglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose and potassium chloride (provided the patient is not hyperka-laemic), and the infusion run at the rate appropriate to the patient’s fluid requirements (usually 125 mL per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 30–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia...
often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:
- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) or
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory or
- complete reversion to the intravenous regimen (especially if the patient is unwell).

### 6.1.1.1 Short-acting insulins

**Soluble insulin** is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (section 6.1.3) and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours.

When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The rapid-acting human insulin analogues, **insulin aspart**, **insulin glulisine**, and **insulin lispro** have a faster onset and shorter duration of action than soluble insulin; as a result, compared to soluble insulin, fasting and preprandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. Subcutaneous injection of insulin analogues may be convenient for those who wish to inject shortly before or, when necessary, shortly after a meal. They can also help those susceptible to hypoglycaemia before lunch and those who eat late in the evening and are prone to nocturnal hypoglycaemia. They can also be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

### Dose

- **By subcutaneous, intramuscular or intravenous injection or intravenous infusion**, according to requirements

### Highly purified animal

#### Counselling

Show container to patient and confirm that patient is expecting the version dispensed

- **Hypurin® Bovine Neutral (Wockhardt)**
  - **Injection**, soluble insulin (bovine, highly purified)
  - 100 units/mL. Net price 10-mL vial = £18.48; cartridges (for Autoopen® Classic) 5 × 3 mL = £27.72

- **Hypurin® Porcine Neutral (Wockhardt)**
  - **Injection**, soluble insulin (porcine, highly purified)
  - 100 units/mL. Net price 10-mL vial = £16.80; cartridges (for Autoopen® Classic) 5 × 3 mL = £25.20

### Human sequence

#### Counselling

Show container to patient and confirm that patient is expecting the version dispensed

- **Actrapid® (Novo Nordisk)**
  - **Injection**, soluble insulin (human, pyr) 100 units/mL. Net price 10-mL vial = £17.48
  - Note: Not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle

- **Humulin S® (Lilly)**
  - **Injection**, soluble insulin (human, prb) 100 units/mL. Net price 10-mL vial = £15.68; 5 × 3-mL cartridge (for most Autoopen® Classic or HumanPen®) = £19.08

- **Insuman® Rapid (Sanofi-Aventis)**
  - **Injection**, soluble insulin (human, crb) 100 units/mL. Net price 5 × 3-mL cartridge (for ClikSTAR® and OptiPen® Pro 1) = £17.50; 5 × 3-mL Insuman® Rapid OptiSet® pre-filled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £17.50
  - Note: Not recommended for use in subcutaneous insulin infusion pumps

### Mixed preparations

See Biphasic Isophane Insulin (section 6.1.1.2)

### INSULIN ASPART

(Recombinant human insulin analogue)

#### Indications

- By subcutaneous infusion, or intravenous infusion

**Humalog** (Lilly)

**Injection**, insulin lispro (recombinant human insulin analogue) 100 units/mL net price 10-mL vial = £16.61; 5 x 3-mL cartridge (for Autopen® Classic or HumaPen®) = £28.31; 5 x 3-mL Humalog®-Pen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46;

5 x 3-mL Humalog® KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46
Counselling Show container to patient and confirm that patient is expecting the version dispensed

**6.1.1.2 Intermediate- and long-acting insulins**

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–35 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir and insulin glargine) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin, see below).

**Isophane insulin** is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (biphasic isophane insulin, biphasic insulin aspart, or biphasic insulin lispro).

**Insulin zinc suspension** (30% amorphous, 70% crystalline) has a more prolonged duration of action.

**Protamine zinc insulin** is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

**Insulin glargine** and insulin detemir are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:
- who require assistance with injecting insulin or whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia or who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs or who cannot use the device needed to inject isophane insulin.

**INSULIN DETEMIR**
(Recombinant human insulin analogue—long acting)

**Indications** diabetes mellitus

**Cautions** section 6.1.1.1; interactions: Appendix 1 (antidiabetics)

Breast-feeding section 6.1.1

Side-effects see under Insulin (section 6.1.1.1)

Dose

- By subcutaneous injection, ADULT and CHILD over 6 years, according to requirements

Levemir® (Novo Nordisk) [FW]

Injection, insulin detemir (recombinant human insulin analogue) 100 units/mL, net price 5 × 3-mL cartridge (for NovoPen® devices) = £42.00; 5 × 3-mL FlexPen® prefilled disposable injection device (range 1–60 units, allowing 1-unit dosage adjustment) = £42.00; 5 × 3-mL Levemir InnoLet® prefilled disposable injection devices (range 1–50 units, allowing 1-unit dosage adjustment) = £44.85

Counselling Show container to patient and confirm that patient is expecting the version dispensed

INSULIN GLARGINE

(Recombinant human insulin analogue—long acting)

Indications diabetes mellitus

Cautions section 6.1.1.1; interactions: Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Breast-feeding section 6.1.1

Side-effects see under Insulin (section 6.1.1.1)

Dose

- By subcutaneous injection, ADULT and CHILD over 6 years, according to requirements

Lantus® (Sanofi-Aventis) [FW]

Injection, insulin glargine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £26.00; 5 × 3-mL cartridge (for ClickSTAR®, OptiPen® Pro 1, and Autopen® 2®) = £39.00; 5 × 3-mL OptiClick® cartridge (for OptiClick® Pen) = £40.36; 5 × 3-mL Lantus® OptiSet® prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £39.00; 5 × 3-mL Lantus® SoloStar® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £40.36

Note The Scottish Medicines Consortium (p. 4) has advised (October 2002) that insulin glargine is accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin

It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

6.1.3 Hypodermic equipment

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.
6.1.2 Antidiabetic drugs

6.1.2.1 Sulfonylureas

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extra-pancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin is contra-indicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient’s age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and shorter-acting alternatives, such as gliclazide or tolbutamide, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include:

- combining with metformin (section 6.1.2.2) (reports of increased hazard with this combination remain unconfirmed);
- combining with pioglitazone, but see section 6.1.2.3;
- combining with saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3);
- combining with exenatide or liraglutide (section 6.1.2.3);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with bedtime isophane insulin (section 6.1.1) but weight gain and hypoglycaemia can occur.

The risk of hypoglycaemia associated with sulfonylureas (see notes above) should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be...
Endocrine system

6 Endocrine system

Diabetic drugs

Sulfonylureas

Sulfonylurea therapy is generally started with one of the short-acting drugs, e.g. tolbutamide, because of the theoretical possibility of hypoglycaemia in the infant. Jaundice may occur.

Pregnancy

The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes, see section 6.1.2.

Breast-feeding

The use of sulfonylureas (except glibenclamide [unlicensed use], see section 6.1.2) in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

Side-effects

Side-effects of sulfonylureas are generally mild and infrequent and include gastrointestinal disturbances such as nausea, vomiting, diarrhoea, and constipation. Hypoglycaemia has been reported with glibenclamide and glipizide.

Sulfonylureas can occasionally cause a disturbance in liver function, which may rarely lead to cholestatic jaundice, hepatitis, and hepatocellular necrosis. Hypersensitivity reactions can occur, usually in the first 6–8 weeks of therapy. They consist mainly of allergic skin reactions which progress rarely to erythema multiforme and exfoliative dermatitis, fever, and jaundice; photosensitivity has rarely been reported with glipizide. Blood disorders are also rare but may include leucopenia, thrombocytopenia, agranulocytosis, pancytopenia, haemolytic anaemia, and aplastic anaemia.

Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

Sulfonylureas should be avoided in those with mild to moderate renal impairment, because of the risk of hypoglycaemia; they should be avoided where possible in severe renal impairment. Glipizide should also be avoided if the patient has both renal and hepatic impairment. If necessary, the short-acting drug tolbutamide can be used in renal impairment, as can gliclazide which is principally metabolised in the liver, but careful monitoring of blood-glucose concentration is essential; care is required to use the lowest dose that adequately controls blood glucose.

Hepatic impairment

Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

Renal impairment

Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia; they should be avoided where possible in severe renal impairment. Glipizide should also be avoided if the patient has both renal and hepatic impairment. If necessary, the short-acting drug tolbutamide can be used in renal impairment, as can gliclazide which is principally metabolised in the liver, but careful monitoring of blood-glucose concentration is essential; care is required to use the lowest dose that adequately controls blood glucose.

Sulfonylureas should be avoided in those with mild to moderate renal impairment, because there is an increased risk of hypoglycaemia; they should be avoided where possible in severe renal impairment. Glipizide should also be avoided if the patient has both renal and hepatic impairment. If necessary, the short-acting drug tolbutamide can be used in renal impairment, as can gliclazide which is principally metabolised in the liver, but careful monitoring of blood-glucose concentration is essential; care is required to use the lowest dose that adequately controls blood glucose.

Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

Pregnancy

The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes, see section 6.1.2.

Breast-feeding

The use of sulfonylureas (except glibenclamide [unlicensed use], see section 6.1.2) in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

Side-effects

Side-effects of sulfonylureas are generally mild and infrequent and include gastrointestinal disturbances such as nausea, vomiting, diarrhoea, and constipation. Hypoglycaemia has been reported with glibenclamide and glipizide.

6.1.2 Antidiabetic drugs

Glimepiride (Non-proprietary) (Non-proprietary)

Tablets, glimepiride 1 mg, net price 30-tab pack = £1.40; 2 mg, 30-tab pack = £1.38; 3 mg, 30-tab pack = £4.57; 4 mg, 30-tab pack = £1.75

Amaryl® (Sanofi-Aventis) (Sanofi-Aventis)

Tablets, all scored, glimepiride 1 mg (pink), net price 30-tab pack = £4.33; 2 mg (green), 30-tab pack = £7.13; 3 mg (yellow), 30-tab pack = £10.75; 4 mg (blue), 30-tab pack = £14.24

GLIPIZIDE

Indications type 2 diabetes mellitus

Cautions see notes above; interactions: Appendix 1 (antidiabetics)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also dizziness, drowsiness

Dose

- Initially 2.5–5 mg daily shortly before breakfast or lunch, adjusted according to response; max. 20 mg daily; up to 15 mg may be given as a single dose; higher doses divided

Glipizide (Non-proprietary) (Pharmacia)

Tablets, glipizide 5 mg, net price 56-tab pack = £4.23

Minodiab® (Pharmacia) (Pharmacia)

Tablets, scored, glipizide 5 mg, net price 28-tab pack = £1.26

TOLBUTAMIDE

Indications type 2 diabetes mellitus

Cautions see notes above; interactions: Appendix 1 (antidiabetics)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also headache, tinnitus

Dose

- 0.5–1.5 g (max. 2 g) daily in divided doses with or immediately after meals or as a single dose with or immediately after breakfast

Tolbutamide (Non-proprietary) (Pharmacia)

Tablets, tolbutamide 500 mg, net price 28-tab pack = £1.74

6.1.2.2 Biguanides

Metformin, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them. It exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

Metformin is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulfonylurea treatment. When the combination of strict diet and metformin treatment fails, other options include:

- combining with a sulfonylurea (section 6.1.2.1) (reports of increased hazard with this combination remain unconfirmed);
- combining with pioglitazone (section 6.1.2.3);
- combining with repaglinide or nateglinide (section 6.1.2.3);
- combining with saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3);
- combining with exenatide or liraglutide (section 6.1.2.3);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin (section 6.1.1) but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses such as 3 g daily are given. Very rarely, metformin can provoke lactic acidosis. It is most likely to occur in patients with renal impairment, see Lactic Acidosis below.

Metformin is used for the symptomatic management of polycystic ovary syndrome [unlicensed indication]; however, treatment should be initiated by a specialist. Metformin improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.

METFORMIN HYDROCHLORIDE

Indications diabetes mellitus (see notes above); polycystic ovary syndrome [unlicensed indication]

Cautions see notes above; determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected); interactions: Appendix 1 (antidiabetics)

Lactic acidosis Use with caution in renal impairment—increased risk of lactic acidosis; avoid in significant renal impairment. NICE recommends that the dose should be reviewed if eGFR less than 45 mL/minute/1.73 m² and to 1. NICE clinical guideline 87 (May 2009): Type 2 diabetes. The management of type 2 diabetes.
6.1.2 Antidiabetic drugs

avoid if eGFR less than 30 mL/minute/1.73 m². Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction.

Contra-indications ketoadosis, see also Lactic Acidosis above; use of general anaesthesia (suspended metformin on the morning of surgery and restart when renal function returns to baseline). Iodine-containing X-ray contrast media Intravascular administration of iodinated contrast agents can cause renal failure. Suspend metformin prior to the test; restart at least 48 hours after the test if renal function has returned to baseline.

Hepatic impairment withdraw if tissue hypoxia likely.

Renal impairment see under Cautions.

Pregnancy used in pregnancy for both pre-existing and gestational diabetes—see also p. 427.

Breast-feeding may be used during breast-feeding—see p. 427.

Side-effects anorexia, nausea, vomiting, diarrhoea (usually transient), abdominal pain, taste disturbance, rarely lactic acidosis (withdraw treatment), decreased vitamin-B₁₂ absorption, erythema, pruritus and urticaria; hepatitis also reported.

Dose

- Diabetes mellitus, ADULT and CHILD over 10 years initially 500 mg with breakfast for at least 1 week then 500 mg with breakfast and evening meal for at least 1 week then 500 mg with breakfast, lunch and evening meal; usual max. 2 g daily in divided doses.
- Polycystic ovary syndrome [unlicensed], initially 500 mg with breakfast for 1 week, then 500 mg with breakfast and evening meal for 1 week, then 1.5–1.7 g daily in 2–3 divided doses.

Note Metformin doses in the BNF may differ from those in the product literature.

Metformin (Non-proprietary) Tablets, coated, metformin hydrochloride 500 mg, net price 28-tab pack = £1.07, 84-tab pack = £1.57; 850 mg, 56-tab pack = £1.67. Label: 21.

Oral solution, sugar-free, metformin hydrochloride 500 mg/5 mL, net price 100 mL = £62.48. Label: 21. Brands include Metformin SR, Bolamyn SR.

Glucophage® (Merck Serono) Tablets, f/c, metformin hydrochloride 500 mg, net price 84-tab pack = £2.88; 850 mg, 56-tab pack = £3.20. Label: 21.

Oral powder, sugar-free, metformin hydrochloride 500 mg/sachet, net price 30-sachet pack = £3.29, 60-sachet pack = £6.58; 1 g/sachet, 30-sachet pack = £6.58; 60-sachet pack = £13.16. Label: 13, 21, counselling, administration. Excipients include aspartame (section 9.4.1) and fucose concentration. Pioglitazone can be used alone or in combination with metformin or with a sulfonylurea (if metformin inappropriate), or with both; the combination of pioglitazone plus metformin is preferred to pioglitazone plus sulfonylurea, particularly for obese patients. Inadequate response to a combination of metformin and sulfonylurea may indicate failing insulin release; the introduction of pioglitazone has a limited role in these circumstances and the initiation of insulin is often more appropriate. Pioglitazone is also licensed in combination with insulin.
with insulin, in patients who have not achieved ade-
quate glycaemic control with insulin alone, when met-
formin is inappropriate. Blood-glucose control may
deteriorate temporarily when pioglitazone is substitut-
ed for an oral antidiabetic drug that is being used in
combination with another. Long-term benefits of piogi-
tazone have not yet been demonstrated. NICE (May
2009) has recommended that, when glycaemic control
is inadequate with existing treatment, pioglitazone can
be added to:
• a sulfonylurea, if metformin is contra-indicated or
not tolerated;
• metformin, if risks of hypoglycaemia with sulfony-
lurea are unacceptable or a sulfonylurea is contra-
indicated or not tolerated;
• a combination of metformin and a sulfonylurea, if
insulin is unacceptable because of lifestyle or other
personal issues, or because the patient is obese.

NICE has recommended that treatment with piogli-
tazone is continued only if HbA1c concentration is reduced
by at least 0.5% within 6 months of starting treatment.
The Scottish Medicines Consortium (p. 4) accepts use of
pioglitazone (February 2007) with metformin and a
sulfonylurea, for patients (especially if overweight)
whose glycaemic control is inadequate despite the use
of 2 oral hypoglycaemic drugs and who are unable or
unwilling to take insulin; treatment should be initiated
and monitored by an experienced diabetes physician.

MHRA/CHM advice
Pioglitazone cardiovascular safety
(December 2007 and January 2011)
Incidence of heart failure is increased when piogi-
tazone is combined with insulin especially in
patients with predisposing factors e.g. previous myo-
cardial infarction. Patients who take pioglitazone
should be closely monitored for signs of heart fail-
ure; treatment should be discontinued if any dete-
rioration in cardiac status occurs.
Pioglitazone should not be used in patients with
heart failure or a history of heart failure.

Rosiglitazone
The marketing authorisation for rosiglitazone
(Avandia®, Avandamet®) has been suspended
(September 2010) following a review by the
European Medicines Agency. The European Medi-
cines Agency concluded that the benefits of
rosiglitazone treatment do not outweigh the cardio-
avascular risks. Prescribers should not issue new or
repeat prescriptions for rosiglitazone. Treatment of
patients who are taking rosiglitazone should be re-
viewed.

Saxagliptin, sitagliptin, and vildagliptin inhibit dipep-
tidylpeptidase-4 to increase insulin secretion and lower
glucagon secretion. They are licensed for use in type 2
diabetes in combination with metformin or a sulfonylur-
ea (if metformin inappropriate) or pioglitazone, when
treatment with either metformin or a sulfonylurea or
pioglitazone fails to achieve adequate glycaemic con-
trol. Sitagliptin is also licensed for use as monotherapy
(if metformin inappropriate), or in combination with
both metformin and a sulfonylurea, or both metformin
and pioglitazone when dual therapy with these drugs
fails to achieve adequate glycaemic control. The com-
bination of sitagliptin and insulin (with or without met-
formin) is also licensed for use when a stable dose of
insulin has not provided adequate glycaemic control.

NICE (May 2009) has recommended that, when glycae-
ic control is inadequate with existing treatment:
• sitagliptin or vildagliptin (instead of a sulfonylurea)
can be added to metformin, if there is a significant
risk of hypoglycaemia or if a sulfonylurea is contra-
indicated or not tolerated;
• sitagliptin or vildagliptin can be added to a sulfo-
ylurea, if metformin is contra-indicated or not tolerance;
• sitagliptin can be added to both metformin and a
sulfonylurea, if insulin is unacceptable because of
lifestyle or other personal issues, or because the
patient is obese.

NICE has recommended that treatment with sitagliptin
or vildagliptin is continued only if HbA1c concentration is reduced by at least 0.5% within 6 months of starting
treatment.
The Scottish Medicines Consortium (p. 4) has advised
that vildagliptin (Galvus®) is accepted for restricted use
within NHS Scotland for the treatment of type 2 dia-
betes mellitus in combination with metformin when
addition of a sulfonylurea is inappropriate (March 2008),
and also in combination with a sulfonylurea if metformin is
inappropriate (September 2009).

Exenatide and liraglutide both bind to, and activate,
the GLP-1 (glucagon-like peptide-1) receptor to increase
insulin secretion, suppress glucagon secretion, and slow
gastric emptying. Treatment with exenatide and liraglu-
tide is associated with the prevention of weight gain and
possible promotion of weight loss which can be bene-
ferial in overweight patients. They are both given by
subcutaneous injection for the treatment of type 2 dia-
betes mellitus.

Exenatide is licensed in combination with metformin or
a sulfonylurea, or both, or with pioglitazone, or with
both metformin and pioglitazone, in patients who have
not achieved adequate glycaemic control with these
drugs alone or in combination.

NICE (May 2009) has recommended that, when glycae-
ic control is inadequate with metformin and sulfony-
lurea treatment, the addition of exenatide may be con-
sidered if the patient has:
• a body mass index of 35 kg/m² or over and is of
European descent (with appropriate adjustment for
other ethnic groups) and weight-related psycholo-
gical or medical problems or
• a body mass index less than 35 kg/m², and insulin
would be unacceptable for occupational reasons or
weight loss would benefit other significant obesity-
related comorbidities.

NICE has recommended that treatment with exenatide
is continued only if HbA1c concentration is reduced by
at least 1% and a weight loss of at least 3% is achieved
within 6 months of starting treatment.
The Scottish Medicines Consortium (p. 4) has advised
(June 2007) that exenatide (Byetta®) is accepted for
restricted use within NHS Scotland for the treatment of
type 2 diabetes in combination with metformin or
sulfonylurea (or both), as an alternative to treatment
with insulin in patients where treatment with metformin
or sulfonylurea (or both) at maximally tolerated doses
has been inadequate, and treatment with insulin would be the next option.

Liraglutide is licensed for the treatment of type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Liraglutide is also licensed for use in combination with both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control.

### NICE guidance

**Liraglutide for the treatment of type 2 diabetes mellitus (October 2010)**

Liraglutide in triple therapy regimens (in combination with metformin and a sulfonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate, and the patient has:
- a body mass index of 35 kg/m² or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, or
- a body mass index of less than 35 kg/m², and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

Treatment with liraglutide in a triple therapy regimen should be continued only if HbA₁c concentration is reduced by at least 1% and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Liraglutide in dual therapy regimens (in combination with metformin or a sulfonylurea) is recommended only if:
- treatment with metformin or a sulfonylurea is contra-indicated or not tolerated, and
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Liraglutide in combination with metformin or a sulfonylurea should be continued only if HbA₁c concentration is reduced by at least 1% within 6 months of starting treatment.

Liraglutide 1.8 mg daily is not recommended.

### ACARBOSE

**Indications** diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

**Cautions** monitor liver function; may enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose); interactions: Appendix 1 (antidiabetics)

**Contra-indications** inflammatory bowel disease, predisposition to partial intestinal obstruction; hernia, previous abdominal surgery

**Hepatic impairment** avoid

**Renal impairment** avoid if eGFR less than 25 mL/minute/1.73 m²

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** flatulence, soft stools, diarrhoea (may need to reduce dose or withdraw), abdominal dis-...

### EXENATIDE

**Indications** see notes above

**Cautions** elderly; pancreatitis (see below); interactions: Appendix 1 (antidiabetics)

**Pancreatitis** Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop; discontinue permanently if pancreatitis is diagnosed

**Contra-indications** ketoacidosis; severe gastro-intestinal disease

**Renal impairment** use with caution if eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—no information available

**Side-effects** gastro-intestinal disturbances including nausea, vomiting, diarrhoea, dyspepsia, abdominal pain and distention, gastro-oesophageal reflux disease, decreased appetite; headache, dizziness, agitation, asthma; hypoglycaemia; increased sweating, injection-site reactions; antibody formation; less commonly pancreatitis (see Cautions above); very rarely anaphylactic reactions; also reported constipation, flatulence, urticaria, and angioedema

**Dose**
- by subcutaneous injection, ADULT over 18 years, initially 5 micrograms twice daily within 1 hour before 2 main meals (at least 6 hours apart), increased if necessary after at least 1 month to max. 10 micrograms twice daily
- Counselling if a dose is missed, continue with the next scheduled dose—do not administer after a meal. Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details

**Byetta®** (Lilly)

**Injection**, exenatide 250 micrograms/mL, net price 5 micrograms/dose prefilled pen (60 doses) = £68.24, 10 micrograms/dose prefilled pen (80 doses) = £68.24.

**Counselling, administration**
**LIRAGLUTIDE**

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis; inflammatory bowel disease; diabetic gastroparesis

**Hepatic impairment** avoid—limited experience

**Renal impairment** avoid if eGFR less than 60 mL/minute/1.73 m²—limited experience

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—no information available

**Side-effects** gastro-intestinal disturbances including nausea, vomiting, constipation, diarrhoea, dyspepsia, abdominal pain and distension, flatulence, gastritis, gastro-oesophageal reflux disease, decreased appetite, headache, dizziness, fatigue, fever, bronchitis, nasopharyngitis; hypoglycaemia; injection site reactions; also reported; subcutaneous injection, ADULT over 18 years, initially 0.6 mg once daily, increased after at least 1 week to 1.2 mg once daily, further increased if necessary after an interval of at least 1 week to max. 1.8 mg once daily

**Note** Dose of concomitant sulfonylurea may need to be reduced

**Victoza®** (Novo Nordisk)

- **Injection**, liraglutide 6 mg/mL, net price 2 × 3-mL prefilled pens = £78.48, 3 × 3-mL prefilled pens = £117.72. Counselling, administration

**NATEGLINIDE**

**Indications** type 2 diabetes mellitus in combination with metformin (section 6.1.2.2) when metformin alone inadequate

**Cautions** substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally); elderly, debilitated and malnourished patients; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis

**Hepatic impairment** caution in moderate hepatic impairment; avoid in severe impairment—no information available

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** hypoglycaemia; hypersensitivity reactions including pruritus, rashes and urticaria

**Dose**

- **ADULT** over 18 years, initially 60 mg 3 times daily within 30 minutes before main meals, adjusted according to response up to max. 180 mg 3 times daily

**Starlix®** (Novartis)

- **Tablets**, f/c, nateglinide 60 mg (pink), net price 84-tab pack = £22.71; 120 mg (yellow), 84-tab pack = £25.88; 180 mg (red), 84-tab pack = £25.88

**PIOGLITAZONE**

**Indications** type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin—see also notes above)

**Cautions** monitor liver function (see below); cardiovascular disease or in combination with insulin (risk of heart failure—see MHRA/CHM advice p. 431); substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally); increased risk of bone fractures, particularly in women; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (antidiabetics)

**Liver toxicity** Rare reports of liver dysfunction; monitor liver function before treatment, and periodically thereafter; advise patients to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop; discontinue if jaundice occurs

**Contra-indications** history of heart failure

**Hepatic impairment** avoid; see also Cautions above

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** gastro-intestinal disturbances, weight gain, oedema, anaemia, headache, visual disturbances, dizziness, arthralgia, hypoaesthesia, haematuria, impotence; less commonly hypoglycaemia, fatigue, insomnia, vertigo, sweating, altered blood lipids, proteinuria; see also Liver Toxicity above

**Dose**

- **ADULT** over 18 years, initially 15–30 mg once daily increased to 45 mg once daily according to response

**Actos®** (Takeda)

- **Tablets**, pioglitazone (as hydrochloride) 15 mg, net price 28-tab pack = £25.83; 30 mg, 28-tab pack = £35.89; 45 mg, 28-tab pack = £39.55

**With metformin**

For prescribing information on metformin, see section 6.1.2.2

**Competact®** (Takeda)

- **Tablets**, f/c, pioglitazone (as hydrochloride) 15 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £35.89; Label: 21

**Dose**

- **ADULT** over 18 years, type 2 diabetes not controlled by metformin alone, 1 tablet twice daily

**Note** Titration with the individual components (pioglitazone and metformin) desirable before initiating Competact®

**REPAGLINDIDE**

**Indications** type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

**Cautions** substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit repaglinide on morning of surgery and recommence when eating and drinking normally); debilitated and malnourished patients; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis

**Hepatic impairment** avoid in severe liver disease

**Renal impairment** use with caution

**Pregnancy** avoid
**SAXAGLIPTIN**

**Indications** see notes above

**Cautions** elderly; **interactions:** Appendix 1 (anti-diabetics)

**Hepatic impairment** use with caution in moderate impairment; avoid in severe impairment

**Renal impairment** avoid if eGFR less than 50 mL/minute/1.73m²

**Pregnancy** avoid—present in milk in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** vomiting, dyspepsia, gastritis; peripheral oedema; headache, diziness, fatigue; upper respiratory tract infection, urinary tract infection, gastro-enteritis, sinusitis, nasopharyngitis; hypoglycaemia, myalgia; less commonly dyslipidaemia, hypertriglyceridaemia, erectile dysfunction, arthralgia; also reported rash

**Dose**

- **ADULT** over 18 years, 5 mg once daily

**Note** Dose of concomitant sulfonylurea may need to be reduced

Onglyza® (Bristol-Myers Squibb) Tablets, pink, f/c, saxagliptin (as hydrochloride) 5 mg, net price 28-tab pack = £31.60

**VILDAGLIPTIN**

**Indications** type 2 diabetes mellitus (in combination with metformin or with a sulfonylurea or with pioglitazone—see also notes above)

**Cautions** elderly; monitor liver function (see below); heart failure (avoid if moderate or severe); **interactions:** Appendix 1 (anti-diabetics)

Liver toxicity Rare reports of liver dysfunction; monitor liver function before treatment and every 3 months for first year and periodically thereafter; advise patients to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop; discontinue if jaundice or other signs of liver dysfunction occur

**Contra-indications** ketoacidosis

**Hepatic impairment** avoid; see also Cautions above

**Renal impairment** avoid if eGFR less than 50 mL/minute/1.73 m²

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** nausea, peripheral oedema, headache, tremor, asthenia, dizziness; less commonly constipation, hypoglycaemia, arthralgia; rarely hepatic dysfunction (see also Liver Toxicity above); very rarely nasopharyngitis, upper respiratory tract infection; pancreatitis also reported

**Dose**

- **ADULT** over 18 years, in combination with metformin or pioglitazone, 50 mg twice daily; in combination with a sulfonylurea, 50 mg daily in the morning

Galvus® (Novartis) Tablets, pale yellow, vildagliptin 50 mg, net price 56-tab pack = £31.76

**Dose of concomitant sulfonylurea or insulin may need to be reduced**

Januvia® (MSD) Tablets, beige, f/c, sitagliptin (as phosphate) 100 mg, net price 28-tab pack = £33.26

The Scottish Medicines Consortium (p. 4) has advised (July 2008) that Januvia® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

**With metformin**

For prescribing information on metformin, see section 6.1.2.2
With metformin

For prescribing information on metformin, see section 6.1.2.2

Eucreas® (Novartis) ▼ (p. 366)

Eucreas® 50 mg/850 mg tablets, f/c, yellow, vildaglitin 50 mg, metformin hydrochloride 850 mg, net price 60-tab pack = £31.76. Label: 21

Eucreas® 50 mg/1 g tablets, f/c, dark yellow, vildaglitin 50 mg, metformin hydrochloride 1 g, net price 60-tab pack = £31.76. Label: 21

Dose: type 2 diabetes mellitus not controlled by metformin alone, ADULT over 18 years, 1 Eucreas® tablet twice daily (based on patient’s current metformin dose)

The Scottish Medicines Consortium (p. 4) has advised (June 2008) that Eucreas® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildaglitin and metformin as separate tablets

6.1.3 Diabetic ketoacidosis

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group1, should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL sodium chloride 0.9% by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.

- When blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline for suggested regimen.

- Include potassium chloride in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).

- Start an intravenous insulin infusion: soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.9% intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.

- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir or insulin glargine) should be continued during treatment of diabetic ketoacidosis.

- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.1 units/mL/hour and blood-glucose concentration should fall by at least 3 mmol/L/hour.

- Once blood-glucose concentration falls below 14 mmol/Litre, glucose 10% should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion.

- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/Litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

For the management of diabetic ketoacidosis in children under 18 years, see BNF for Children.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

6.1.4 Treatment of hypoglycaemia

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from nondiet versions of Lucozade® Energy Original 55 mL, Coca-Cola® 100 mL, Ribena® Blackcurrant 18 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps. If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be required. Patients whose hypoglycaemia is caused by insulin or sulfonylureas should be given an emergency prescription for the patient to keep to hand in case of hypoglycaemia.

1. Available at www.diabetes.nhs.uk

2. Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, Hypo-Fit®) are available on prescription for the patient to keep to hand in case of hypoglycaemia.
6.1.5 Treatment of diabetic nephropathy and neuropathy

**GLUCAGON**

**Indications**
see notes above and under Dose

**Cautions**
see notes above, insulinoma, glucagonoma;
ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency

**Contra-indications**
phaeochromocytoma

**Side-effects**
nausea, vomiting, abdominal pain,
hypokalaemia, hypotension, rarely hypersensitivity

**Dose**
- Insulin-induced hypoglycaemia, by subcutaneous,
  intramuscular, or intravenous injection, ADULT and
  CHILD over 8 years (or body-weight over 25 kg), 1 mg;
  CHILD under 8 years (or body-weight under 25 kg),
  500 micrograms; if no response within 10 minutes
  intravenous glucose must be given
- Diagnostic aid, consult product literature
- Beta-blocker poisoning, see p. 37

**Note**
1 unit of glucagon = 1 mg of glucagon

1. GlucaGen® HypoKit (Novo Nordisk) 

   **Injection**, powder for reconstitution, glucagon (rys) as
   hydrochloride with lactose, net price 1-mg vial with
   prefilled syringe containing water for injection = £11.52

2. (UK) restriction does not apply where administration is for
   saving life in emergency

**DIAZOXIDE**

**Indications**
chronic intractable hypoglycaemia;
hypertensive emergency—but no longer recom-
med, see section 2.5

**Cautions**
ischaemic heart disease; monitor blood
pressure; during prolonged use monitor white cell and
platelet count, and in children, regularly assess
growth, bone, and psychological development; inter-
actions: Appendix 1 (diazoxide)

**Renal impairment**
dose reduction may be required

**Pregnancy**
prolonged use in second or third trimesters
may produce alopecia and impaired glucose tolerance
in neonate; inhibits uterine activity during labour

**Side-effects**
anasxia, nausea, vomiting, hyperuric-
aemia, hypotension, oedema, tachycardia, arrhyth-
mias, extrapyramidal effects; hypertrichosis on pro-
longed treatment

**Dose**
- By mouth, ADULT and CHILD, initially 5 mg/kg daily in
  2–3 divided doses

**Eudemine®** (UCB Pharma) 

- **Tablets**, diazoxide 50 mg. Net price 100 = £44.64
- **Injection**, see section 2.5.1

---

**Diabetic nephropathy**

Regular review of diabetic patients should include an
annual test for urinary protein (using *Albuslitix®*)
and serum creatinine measurement. If the urinary protein
test is negative, the urine should be tested for
microalbuminuria (the earliest sign of nephropathy). If
reagent strip tests (*Micro-Test 17th* or Micro-
muntest®) are used and prove positive, the result
should be confirmed by laboratory analysis of a urine
sample. Provided there are no contra-indications, all
diabetic patients with nephropathy causing proteinuria
or with established microalbuminuria (at least 3 positive
tests) should be treated with an ACE inhibitor (section
2.5.5.1) or an angiotensin-II receptor antagonist (section
2.5.5.2) even if the blood pressure is normal; in any case,
to minimise the risk of renal deterioration, blood
pressure should be carefully controlled (section 2.5).

ACE inhibitors can potentiate the hypoglycaemic effect
of insulin and oral antidiabetic drugs; this effect is more
likely during the first weeks of combined treatment and
in patients with renal impairment.

For the treatment of hypertension in diabetes, see sec-
tion 2.5.

**Diabetic neuropathy**

Optimal diabetic control is beneficial for the manage-
ment of painful neuropathy in patients with type 1
 diabetes (see also section 4.7.3). *Paracetamol* (p. 259)
or a non-steroidal anti-inflammatory drug such as ibu-
profen (p. 636) may relieve *mild to moderate pain*.

**Duloxetine** (p. 243) is effective for the treatment of
painful diabetic neuropathy; *amitriptyline* (p. 235)
[unlicensed use] can be used if duloxetine is ineffective
or unsuitable. *Nortriptyline* (p. 236) [unlicensed] may
be better tolerated than amitriptyline. If treatment with
amitriptyline or duloxetine is inadequate, treatment with
pregabalin (p. 284) should be tried. Combination ther-
apy of duloxetine or amitriptyline with pregabalin can be
used if monotherapy at the maximum tolerated dose
does not control symptoms.

Neuropathic pain may respond to opioid analgesics.
There is evidence of efficacy for *tramadol* (p. 271),
*morphine* (p. 268), and *oxycodeone* (p. 269); however,
treatment with morphine or oxycodone should be
initiated only under specialist supervision. *Tramadol*
can be prescribed while the patient is waiting for assess-
ment by a specialist if other treatments have been
unsuccessful.

**Gabapentin** (p. 284) and *carbamazepine* (p. 281) are
sometimes used for the treatment of neuropathic pain.
*Capsaicin* cream 0.075% (p. 664) is licensed for painful
diabetic neuropathy and may have some effect, but it
produces an intense burning sensation during the initial
treatment period.

In *autonomic neuropathy* diabetic diarrhoea can often
be managed by 2 or 3 doses of *tetracycline* 250 mg
[unlicensed use] (p. 347). Otherwise *codeine* (p. 58) is
the best drug, but other antidiarrhoeal preparations can be tried. An antidiarrhoeal which promotes gastric transit, such as metoclopramide (p. 253) or domperidone (p. 253), is helpful for gastroparesis. In rare cases when an antidiarrhoeal does not help, erythromycin (especially when given intravenously) may be beneficial but this needs confirmation.

In neuropathic postural hypotension increased salt intake and the use of the mineralocorticoid fludrocortisone 100–400 micrograms daily [unlicensed use] (p. 442) may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen (p. 636) and ephedrine hydrochloride (p. 179) [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.

Gustatory sweating can be treated with an antimuscarinic such as propantheline bromide (p. 48); side-effects are common. For the management of hyperhidrosis, see section 13.12.

In some patients with neuropathic oedema, ephedrine hydrochloride [unlicensed use] 30–60 mg 3 times daily offers effective relief.

For the management of erectile dysfunction, see section 7.4.5.

If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines (section 6.1.3). Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

### Urinalysis

Tests for glucose range from reagent strips specific to glucose to reagent tablets which detect all reducing sugars. Few patients still use Clinistix®, Clinistix® is suitable for screening purposes only. Tests for ketones by patients are rarely required unless they become unwell—see also Blood Monitoring, above.

Microalbuminuria can be detected with Microlit-Test II but this should be followed by confirmation in the laboratory, since false positive results are common.

#### Glucose

- **Clinitest®** (Bayer Diabetes Care) Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £3.27
- **Clinistix®** (Bayer Diabetes Care) Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.87
- **Diabur-Test 5000®** (Roche Diagnostics) Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.78
- **Medi-Test® Glucose** (BHR) Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.33

#### Ketones

- **Ketostix®** (Bayer Diabetes Care) Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.95
- **Ketodiastix** (Bayer Diabetes Care) Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.76
- **Ketur Test®** (Roche Diagnostics) Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.76
- **Ketostix®** (Bayer Diabetes Care) Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.76
- **Albustix®** (Siemens) Reagent strips, for detection of protein in urine. Net price 50-strip pack = £4.10
- **Medi-Test® Protein 2** (BHR) Reagent strips, for detection of protein in urine. Net price 50-strip pack = £3.27

#### Other reagent strips available for urinalysis include:

- **Combur-3 Test®** (glucose and protein—Roche Diagnostics), **Clinitek Microalbumin®** (albumin and creatinine—Siemens), **Ketodiastix®** (glucose and ketones—Bayer Diagnostics), **Medi-Test Combi 2®** (glucose and protein—BHR), **Microalbumin®** (albumin—Roche Diagnostics), **Microalbumin®** (albumin and creatinine—Siemens), **Uristix®** (glucose and protein—Siemens)

Oral glucose tolerance test

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and blood glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes. The oral glucose tolerance test generally involves giving anhydrous glucose 75 g (equivalent to Glucose BP 82.5 g) by mouth to the fasting patient, and measuring blood-glucose concentrations at intervals.

The appropriate amount of glucose should be given with 200–300 mL fluid. Anhydrous glucose 75 g may alternatively be given as 113 mL Polycal® (Nutricia Clinical) with extra fluid to administer a total volume of 200–300 mL.

### 6.2 Thyroid and antithyroid drugs

#### 6.2.1 Thyroid hormones

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto's thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. **Levothyroxine sodium** (thyroxine sodium) is the treatment of choice for maintenance therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone. See *BNF for Children* (section 6.2.1) for suitable dosage regimens.
6.2.2 Antithyroid drugs

Levotyroxine sodium has a similar action to levothyroxine but is more rapidly metabolised and has a more rapid effect; 20 micrograms is equivalent to 100 micrograms of levothyroxine. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.

Levotyroxine by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone, and treatment of infection; assisted ventilation is often required.

**LIOTHYRONINE SODIUM**
(†-Tri-iodothyronine sodium)

**Indications**
Hypothyroidism; see also notes above

**Cautions**
Panhypopituitarism or predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levotyroxine), elderly, cardiovascular disorders (including hypertension, myocardial insufficiency or myocardial infarction, see Initial Dosage below), long-standing hypothyroidism, diabetes insipidus, diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased); interactions: Appendix 1 (hormone therapy)

**Initial dosage**
Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia. If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose

**Contra-indications**
Thyrotoxicosis

**Pregnancy**
Monitor maternal serum-thyrotrophin concentration—levothyroxine may cross the placenta and excessive maternal concentration can be detrimental to fetus

**Breast-feeding**
Amount too small to affect tests for neonatal hypothyroidism

**Side-effects**
Usually at excessive dosage (see Initial Dosage above) include diarrhoea, vomiting, anginal pain, arrhythmias, palpitation, tachycardia, tremor, restlessness, excitability, insomnia; headache, flushing, sweating, fever, heat intolerance, weight-loss, muscle cramp, and muscular weakness; transient hair loss in children; hypersensitivity reactions including rash, pruritus and oedema also reported

**Dose**
- **Adult** over 18 years, initially 50–100 micrograms once daily; preferably before breakfast, adjusted in steps of 25–50 micrograms every 3–4 weeks according to response (usual maintenance dose 100–200 micrograms once daily); in cardiac disease, severe hypothyroidism, and patients over 50 years, initially 25 micrograms once daily, adjusted in steps of 25 micrograms every 4 weeks according to response; usual maintenance dose 50–200 micrograms once daily; **Child** under 18 years see BNF for Children (section 6.2.1)
- Congenital hypothyroidism and juvenile myxoedema, see BNF for Children (section 6.2.1)

**Levothyroxine (Non-proprietary)**

- **Tablets**, levotyroxine sodium 25 micrograms, net price 28-tab pack = £2.22; 50 micrograms, 28-tab pack = £1.09; 100 micrograms, 28-tab pack = £1.09
  - Brands include Evotrox® (sugar-free)
- **Oral solution**, levotyroxine sodium 25 micrograms/5 mL, net price 100 mL = £42.75; 50 micrograms/5 mL, 100 mL = £52.75

**Note**
All strengths of levothyroxine oral solution by Almus and branded as Evotrox®, have been reformulated (August 2010) leading to an increase in potency of approximately 10%; the manufacturer advises that the recommended dose has not changed, but recommends increased monitoring of patients on these preparations as dose adjustments may be necessary

**LIOTHYRONINE SODIUM**
(†-Tri-iodothyronine sodium)

**Indications**
See notes above

**Cautions**
See under Levothyroxine Sodium; interactions: Appendix 1 (thyroid hormones)

**Contra-indications**
See under Levothyroxine Sodium

**Pregnancy**
Does not cross the placenta in significant amounts; monitor maternal thyroid function tests—dosage adjustment may be necessary

**Breast-feeding**
Amount too small to affect tests for neonatal hypothyroidism

**Side-effects**
See under Levothyroxine Sodium

**Dose**
- **By mouth**, initially 10–20 micrograms daily gradually increased to 60 micrograms daily in 2–3 divided doses; **Elderly** smaller initial doses; **Child**, adult dose reduced in proportion to body-weight
- **By slow intravenous injection**, hypothyroid coma, 5–20 micrograms repeated every 12 hours or as often as every 4 hours if necessary; **alternatively** initially 50 micrograms then 25 micrograms every 8 hours reducing to 25 micrograms twice daily

**Liothyronine sodium** (Goldshield) *(†)*

- Tablets, scored, liothyronine sodium 20 micrograms, net price 28-tab pack = £26.15
- Triiodothyronine (Goldshield) *(†)*
  - Injection, powder for reconstitution, liothyronine sodium with dextran. Net price 20-microgram amp = £37.92

6.2.2 Antithyroid drugs

Antithyroid drugs are used for hypothyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole is the most commonly used drug. Propylthiouracil should be reserved for patients who are intolerant of carbimazole or for those who suffer sensitivity reactions to carbimazole, because sensitivity is not necessarily displayed to both drugs. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

**Neutropenia and agranulocytosis**
Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.
1. Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
2. A white blood cell count should be performed if there is any clinical evidence of infection.
3. Carbimazole should be stopped promptly if there is any clinical or laboratory evidence of neutropenia.
Carbimazole is given in a dose of 15 to 40 mg daily; higher doses should be prescribed under specialist supervision only. This dose is continued until the patient becomes euthyroid, usually after 4 to 8 weeks and the dose is then gradually reduced to a maintenance dose of 5 to 15 mg. Therapy is usually given for 12 to 18 months. Children may be given carbimazole in an initial dose of 250 micrograms/kg three times daily, adjusted according to response; treatment in children should be undertaken by a specialist. Rash and pruritus are common but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted. All patients should be advised to report any sore throat immediately because of the rare complication of agranulocytosis (see Neutropenia and Agranulocytosis, above).

Propylthiouracil is given in a dose of 200 to 400 mg daily in divided doses in adults and this dose is maintained until the patient becomes euthyroid; the dose may then be gradually reduced to a maintenance dose of 50 to 150 mg daily in divided doses. Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre. A combination of carbimazole, 40 to 60 mg daily with levothyroxine, 50 to 150 micrograms daily, may be used in a blocking-replacement regimen; therapy is usually given for 18 months. The blocking-replacement regimen is not suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide ($^{131}$I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroideectomy.

Propranolol is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but nadolol is also used. For doses and preparations of beta-blockers see section 2.4.

Thyrotoxic crisis (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol (5 mg) and hydrocortisone (100 mg every 6 hours, as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Pregnancy and breast-feeding Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen (see above) is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate—use carbimazole in pregnancy only if propylthiouracil is not suitable. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Carbimazole and propylthiouracil appear in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used.

### CARBIMAZOLE

**Indications**

hyperthyroidism

**Contra-indications**

severe blood disorders

**Hepatic impairment**

use with caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy**

neonatal goitre and hypothyroidism; has been associated with congenital defects including aplasia cutis of the neonate; see also notes above

**Breast-feeding**

amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used; see also notes above

**Side-effects**

nausea, mild gastro-intestinal disturbances, taste disturbance, headache; fever, malaise; rash, pruritus, arthralgia; rarely myopathy, alopecia, bone marrow suppression (including pancytopenia and agranulocytosis, see Neutropenia and Agranulocytosis above), and jaundice

**Counselling**

Warn patient to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops

**Dose**

- See notes above

Carbimazole (Non-proprietary) tablets

Tablets, carbimazole 5 mg, net price 100-tab pack = £4.53; 20 mg, 100-tab pack = £16.83. Counselling, blood disorder symptoms

Neo-Mercazole® tablets, both pink, carbimazole 5 mg, net price 100-tab pack = £3.85; 20 mg, 100-tab pack = £11.44. Counselling, blood disorder symptoms

### IODINE AND IODIDE

**Indications**

thyrotoxicosis (pre-operative)

**Cautions**

children; not for long-term treatment

**Pregnancy**

neonatal goitre and hypothyroidism; see also notes above

**Breast-feeding**

stop breast-feeding; danger of neonatal hypothyroidism or goitre; appears to be concentrated in milk; see also notes above

**Side-effects**

hypersensitivity reactions including cornea-like symptoms, headache, lacrimation, conjunctivitis, pain in salivary glands, laryngitis, bronchitis, rashes; on prolonged treatment depression, insomnia, impotence; goitre in infants of mothers taking iodides

**Dose**

- See under preparation

**Aqueous Iodine Oral Solution**

**Oral solution**, iodine 5%, potassium iodide 10% in purified water, freshly boiled and cooled, total iodine 130 mg/mL, net price 500 mL = £6.24. Label: 27

Dose 0.1-0.3 mL 3 times daily well diluted with milk or water
**PROPYLTHIOURACIL**

**Indications** hyperthyroidism

**Caution** monitor for hepatotoxicity

**Hepatotoxicity** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

**Hepatic impairment** reduce dose (see also Hepatotoxicity above).

**Renal impairment** use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m²; use half normal dose if eGFR less than 10 mL/minute/1.73 m².

**Pregnancy** neonatal goitre and hypothyroidism; see also notes above.

**Breast-feeding** monitor infant’s thyroid status but amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function; see also notes above.

**Side-effects** see under Carbimazole; leucopenia; rarely cutaneous vasculitis, thrombocytopenia, aplastic anaemia, hyperprothrombinaemia, hepatic disorders (including hepatitis, hepatic failure, encephalopathy, hepatic necrosis; see also Hepatotoxicity above), nephritis, lupus erythematosus-like syndromes.

**Dose**

- See notes above.

**Propylthiouracil** (Non-proprietary)

Tablets, propylthiouracil 50 mg. Net price 56-tab pack = £47.11, 100-tab pack = £67.38

---

**6.3 Corticosteroids**

**6.3.1 Replacement therapy**

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison’s disease* or following adrenalectomy, hydrocortisone 20 to 30 mg daily by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone 50 to 300 micrograms daily.

In *acute adrenocortical insufficiency*, hydrocortisone is given intravenously (preferably as sodium succinate) in doses of 100 mg every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

**Fludrocortisone Acetate**

**Indications** mineralocorticoid replacement in adrenocortical insufficiency

**Caution** section 6.3.2; interactions: Appendix 1 (corticosteroids).

**Contra-indications** section 6.3.2.

**Hepatic impairment** section 6.3.2.

**Renal impairment** section 6.3.2.

**Pregnancy** section 6.3.2.

**Breast-feeding** section 6.3.2.

**Side-effects** section 6.3.2.

**Dose**

- 50–300 micrograms daily; *CHILD* 5 micrograms/kg daily.

**Florinef®** (Squibb) (TR)

Tablets, scored, fludrocortisone acetate 100 micrograms. Net price 100-tab pack = £5.05. Label: 10, steroid card.

**6.3.2 Glucocorticoid therapy**

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids below). The mineralocorticoid activity of fludrocortisone (section 6.3.1) is so high that its anti-inflammatory activity is of no clinical relevance. The table below shows equivalent anti-inflammatory doses.

**Equivalent anti-inflammatory doses of corticosteroids**

This table takes no account of mineralocorticoid effects; nor does it take account of variations in duration of action.

<table>
<thead>
<tr>
<th>Corticosteroids</th>
<th>Equivalent dose</th>
</tr>

<tr>
<td>Deflazacort 6 mg</td>
<td>Hydrocortisone 20 mg</td>
</tr>
<tr>
<td>Methylprednisolone 4 mg</td>
<td>Triamcinolone 4 mg</td>
</tr>
</tbody>
</table>

The relatively high mineralocorticoid activity of cortisone and hydrocortisone, and the resulting fluid retention, make them unsuitable for disease suppression on a long-term basis. However, they can be used for adrenal replacement therapy (section 6.3.1); hydrocortisone is preferred because cortisone requires conversion in the
liver to hydrocortisone. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked (section 13.4); cortisone is not active topically.

Prednisolone and prednisone have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone and dexamethasone have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia). Some esters of betamethasone and of beclometasone (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort has a high glucocorticoid activity; it is derived from prednisolone.

Use of corticosteroids

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin (section 13.4). Corticosteroids should be avoided or used only under specialist supervision in psoriasis (section 13.5).

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease (section 1.5). They are also included in locally applied creams for haemorrhoids (section 1.7.2).

Use can be made of the mineralocorticoid activity of fludrocortisone to treat postural hypotension in autonomic neuropathy (section 6.1.5).

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone (50 mg intravenously every 6 hours) and fludrocortisone (50 micrograms daily by mouth) is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone and betamethasone have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of 1 mg of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see also p. 22); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline (epinephrine) (section 3.4.3). In such cases hydrocortisone (as sodium succinate) by intravenous injection in a dose of 100 to 300 mg may be required.

Corticosteroids are preferably used by inhalation in the management of asthma (section 3.2) but systemic therapy in association with bronchodilators is required for the emergency treatment of severe acute asthma (section 3.1.1).

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia (section 9.1.3), and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura (section 9.1.4).

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, such as 40 to 60 mg prednisolone daily, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see Prescribing in Palliative Care, section 8.2.2 (immunosuppression), section 10.1.2 (rheumatic diseases), section 11.4 (eye), section 12.1.1 (otitis externa), section 12.2.1 (allergic rhinitis), and section 12.3.1 (aphthous ulcers).

Administration

Whenever possible local treatment with creams, intraarticular injections, inhalations, eye-drops, or enemas should be used in preference to systemic treatment. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can...
sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma (section 3.2). Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug (section 8.2.1).

Cautions and contra-indications of corticosteroids

Adrenal suppression

During prolonged therapy with corticosteroids, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death (see Withdrawal of Corticosteroids, below). Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists must know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- **Minor surgery under general anaesthesia**—usual oral corticosteroid dose on the morning of surgery or hydrocortisone 25–50 mg (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.

- **Moderate or major surgery**—usual oral corticosteroid dose on the morning of surgery and hydrocortisone 25–50 mg intravenously at induction, followed by hydrocortisone 25–50 mg 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections.

Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card (see p. 445) which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

Infections

Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. *septicaemia* and *tuberculosis* may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated (see also section 11.4.1).

**Chickenpox** Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with variella–zoster immunoglobulin (section 14.5.2) is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment (section 5.3.2.1). Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

**Measles** Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin (section 14.5.1) may be needed.

Withdrawal of corticosteroids

The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
- been given repeat doses in the evening;
- received more than 3 weeks’ treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

**Psychiatric reactions**

Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be...
alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

Advice to patients
A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following (for details, see Infections, Adrenal Suppression, Psychiatric Reactions, and Withdrawal of Corticosteroids above):

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe chickenpox and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting measles;

- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;

- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;

- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur; for details see Side-effects of Corticosteroids, p. 446.

Steroid treatment cards (see below) should be issued where appropriate. Doctors and pharmacists can obtain supplies of the card from:

**England and Wales**
3M Security Printing and Systems Limited
Gorse Street, Chadderton
Oldham, OL9 9QH

Steroid treatment cards

**STEROID TREATMENT CARD**

I am a patient on STEROID treatment which must not be stopped suddenly

- If you have been taking this medicine for more than three weeks, the dose should be reduced gradually when you stop taking steroids unless your doctor says otherwise.

- Read the patient information leaflet given with the medicine.

- Always carry this card with you and show it to anyone who treats you (for example a doctor, nurse, pharmacist or dentist). For one year after you stop the treatment, you must mention that you have taken steroids.

- If you become ill, or if you come into contact with anyone who has an infectious disease, consult your doctor promptly. If you have never had chickenpox, you should avoid close contact with people who have chickenpox or shingles. If you do come into contact with chickenpox, see your doctor urgently.

- Make sure that the information on the card is kept up to date.

**Other cautions and contra-indications**

Other cautions include: children and adolescents (growth restriction possibly irreversible), elderly (close supervision required particularly on long-term treatment); frequent monitoring required if history of tuberculosis (or X-ray changes), hypertension, recent myocardial infarction (rupture reported), congestive heart failure, diabetes mellitus including family history, osteoporosis (post-menopausal women at special risk), glaucoma (including family history), ocular herpes simplex—risk of corneal perforation, severe affective disorders (particularly if history of steroid-induced psychosis—see also Psychiatric Reactions, p. 444), epilepsy, peptic ulcer, hypothyroidism, history of steroid myopathy, ulcerative colitis, diverticulitis, recent intestinal anastomoses, thromboembolic disorders; myasthenia gravis; **interactions**: Appendix 1 (corticosteroids).

Other contra-indications include: systemic infection (unless specific therapy given); avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished).
446 6.3.2 Glucocorticoid therapy

**Hepatic impairment**

When corticosteroids are administered orally or parenterally, the plasma-drug concentration may be increased in patients with hepatic impairment. Corticosteroids should be used with caution in hepatic impairment and the patient should be monitored closely.

**Renal impairment**

Oral and parenteral preparations of corticosteroids should be used with caution in patients with renal impairment.

**Pregnancy and breast-feeding**

The benefit of treatment with corticosteroids during pregnancy and breast-feeding outweighs the risk; pregnant women with fluid retention should be monitored closely. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) has concluded:

- corticosteroids vary in their ability to cross the placenta; betamethasone and dexamethasone cross the placenta readily while 88% of prednisolone is inactivated as it crosses the placenta;
- there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip;
- when administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome);
- any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important;
- prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant; infants should be monitored for adrenal suppression if the mothers are taking a higher dose.

**Side-effects of corticosteroids**

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

**Mineralocorticoid** side-effects include hypertension, sodium and water retention, and potassium and calcium loss. They are most marked with fludrocortisone, but are significant with cortisol, hydrocortisone, corticosterone, and tetrahydrocortisone (tetracortisone). Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

**Glucocorticoid** side-effects include diabetes and osteoporosis (section 6.6), which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae; in addition high doses are associated with avascular necrosis of the femoral head. Muscle wasting (proximal myopathy) can also occur. Corticosteroid therapy is also weakly linked with peptic ulceration and perforation (the potential advantage of soluble or enteric-coated preparations to reduce the risk is speculative only). See also Psychiatric Reactions, p. 444.

High doses of corticosteroids can cause Cushing’s syndrome, with moon face, striae, and acne; it is usually reversible on withdrawal of treatment, but this must always be gradually tapered to avoid symptoms of acute adrenal insufficiency (important: see also Adrenal Suppression, p. 444). In children, administration of corticosteroids may result in suppression of growth. For the effect of corticosteroids given in pregnancy, see Pregnancy and Breast-feeding, above.

Side-effects can be minimised by using lowest effective dose for minimum period possible. Other side-effects include: gastro-intestinal effects: dyspepsia, abdominal distension, acute pancreatitis, oesophageal ulceration and candidiasis; musculoskeletal effects: muscle weakness, vertebral and long bone fractures, tendon rupture; endocrine effects: menstrual irregularities and amenorrhoea, hirsutism, weight gain, hypercholesterolaemia, hyperlipidaemia, negative nitrogen and calcium balance, increased appetite; increased susceptibility to and severity of infection, reactivation of dormant tuberculosis; neuropsychiatric effects: psychological dependence, insomnia, increased intracranial pressure with papilloedema in children (usually after withdrawal), aggravation of schizophrenia, aggravation of epilepsy; ophthalmic effects: glaucoma, papilloedema, posterior subcapsular cataracts, corneal or scleral thinning and exacerbation of ophthalmic viral or fungal disease, increased intra-ocular pressure, exophthalmos; also impaired healing, petechiae, ecchymoses, facial erythema, suppression of skin test reactions, urticaria, hyperhidrosis, skin atrophy, bruising, telangiectasia, myocardial rupture following recent myocardial infarction, congestive heart failure, leucocytosis, hyperglycaemia, thromboembolism, nausea, malaise, hiccups, headache, vertigo.

For other references to the side-effects of corticosteroids see section 3.2 (asthma), section 11.4 (eye) and section 13.4 (skin).

**BETAMETHASONE**

**Indications** suppression of inflammatory and allergic disorders; congenital adrenal hyperplasia; see also notes above; ear (section 12.1.1); eye (section 11.4.1); nose (section 12.2.1); oral ulceration (section 12.3.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above; transient effect on fetal movements and heart rate

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- **By mouth**, usual range 0.5–5 mg daily; see also Administration (above)
- **By intramuscular injection or slow intravenous injection or infusion**, 4–20 mg, repeated up to 4 times in 24 hours; **CHILD**, by slow intravenous injection, up to 1 year 1 mg, 1–5 years 2 mg, 6–12 years 4 mg, repeated up to 4 times in 24 hours according to response
**CORTISONE ACETATE**

**Indications** see under Dose but now superseded, see also notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above; hepatic conversion to active metabolite hydrocortisone may be affected

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- For replacement therapy, 25–37.5 mg daily in divided doses

**Cortisone (Non-proprietary)**

**Indications** suppression of inflammatory and allergic disorders

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- Usual maintenance 3–18 mg daily (acute disorders, initially up to 120 mg daily); see also Administration (above)
- CHILD 0.25–1.5 mg/kg daily (or on alternate days); see also Administration (above)

**Betnelan** (UCB Pharma) [®]

**Tablets** scored, betamethasone 500 micrograms. Net price 100-tab pack = £4.22. Label: 10, steroid card, 21

**Betnesol** (UCB Pharma) [®]

**Soluble tablets** pink, scored, betamethasone 500 micrograms (as sodium phosphate). Net price 100-tab pack = £4.97. Label: 10, steroid card, 13, 21

**Injection** betamethasone 4 mg (as sodium phosphate) /mL. Net price 1-mL amp = £1.17. Label: 10, steroid card

**DEXAMETHASONE**

**Injection**, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 83p. Label: 10, steroid card

**Dose**
- By intramuscular injection or slow intravenous injection or infusion, 0.4–20 mg. CHILD 200–400 micrograms/kg daily
- Cerebral oedema, by intravenous injection 8–16 mg initially, then 5 mg by intramuscular injection or intravenous injection every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days
- Adjuvant treatment of bacterial meningitis, (starting before or with first dose of antibacterial treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days; CHILD 125 micrograms/kg every 6 hours for 4 days
- Injection, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.00, 2-mL vial = £1.98. Label: 10, steroid card

**Dexamethasone (Non-proprietary)**

**Tablets**, dexamethasone 500 micrograms, net price 28-tab pack = £38.00; 2 mg, 50-tab pack = £7.46, 100-tab pack = £13.85. Label: 10, steroid card, 21

**Oral solution**, sugar-free, dexamethasone (as sodium phosphate) 2 mg/5 mL, net price 150-mL = £42.30. Label: 10, steroid card, 21

**Brands include Dexno®**

**Injection**, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 83p. Label: 10, steroid card

**Dose**
- By intramuscular injection or slow intravenous injection or infusion, 0.4–20 mg. CHILD 200–400 micrograms/kg daily
- Cerebral oedema, by intravenous injection 8–16 mg initially, then 5 mg by intramuscular injection or intravenous injection every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days
- Adjuvant treatment of bacterial meningitis, (starting before or with first dose of antibacterial treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days; CHILD 125 micrograms/kg every 6 hours for 4 days
- Injection, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.00, 2-mL vial = £1.98. Label: 10, steroid card

**HYDROCORTISONE**

**Indications** adrenocortical insufficiency (section 6.3.1); shock; see also notes above; hypersensitivity reactions e.g. anaphylaxis and angioedema (section 3.4.3); asthma [section 3.1]; severe inflammatory bowel disease (section 1.5); haemorrhoids (section 1.7.2); rheumatic disease (section 10.1.2); eye (section 11.4.1); skin (section 13.4)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also perineal irritation

**Dose**
- By mouth, replacement therapy, 20–30 mg daily in divided doses—see section 6.3.1; CHILD 10–30 mg
- By intramuscular injection or slow intravenous injection or infusion, 100–500 mg, 3–4 times in 24 hours or
6.3.2 Glucocorticoid therapy

as required, CHILD by slow intravenous injection up to 1 year 25 mg, 1–5 years 50 mg, 6–12 years 100 mg

Hydrocortisone (Non-proprietary)  F
Tablets, scored, hydrocortisone 10 mg, net price 30-tab pack = £44.25; 20 mg, 30-tab pack = £47.17. Label: 10, steroid card, 21

Ectofosse® (Sovereign)  F
Injection, hydrocortisone 100 mg (as sodium phosphate)/mL, net price 1-mL amp = £1.08, 5-mL amp = £4.89. Label: 10, steroid card

Note: Paraesthesia and pain (particularly in the perineal region) may follow intravenous injection of the phosphate ester

1. This restriction does not apply where administration is for saving life in emergency

METHYLPREDNISOLONE

Indications suppression of inflammatory and allergic disorders; severe inflammatory bowel disease (section 1.5); cerebral oedema associated with malignancy; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)

Cautions see notes above; also rapid intravenous administration of large doses associated with cardiovascular collapse

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

• By mouth, usually 2–40 mg daily; see also Administration (above)

• By intramuscular injection or slow intravenous injection or infusion, initially 10–500 mg; graft rejection, up to 1 g daily by intravenous infusion for up to 3 days

Prednisolone (Non-proprietary)  F
Tablets, prednisolone 1 mg, net price 28-tab pack = 93p; 5 mg, 28-tab pack = £1.03; 25 mg, 56-tab pack = £30.00. Label: 10, steroid card, 21

Tablets, e/c, prednisolone 2.5 mg (brown), net price 30-tab pack = £4.65, 100-tab pack = £30.79; 5 mg (red), 28-tab pack = £8.69, 100-tab pack = £31.04. Label: 5, 10, steroid card, 25

Brands include Deltacortril

Soluble tablets, prednisolone 5 mg (as sodium phosphate), net price 30-tab pack = £8.85. Label: 10, steroid card, 13, 21

Injection, see section 10.1.2.2

PREDNISONE

Indications moderate to severe rheumatoid arthritis (section 10.1.2.1)

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

• ADULT over 18 years, initially 10–20 mg at bedtime, adjusted according to response

Lodotra® (Napp)  F
Tablets, m/r, yellow, prednisone 1 mg, net price 30-tab pack = £26.70; 2 mg, 30-tab pack = £26.70, 100-tab pack = £89.00; 5 mg, 30-tab pack = £26.70, 100-tab pack = £89.00. Label: 10, steroid card, 13, 21
TRIAMCINOLONE

Indications  suppression of inflammatory and allergic disorders; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)
Cautions  see notes above

Side-effects
• By deep intramuscular injection, into gluteal muscle, 40 mg of acetonide for depot effect, repeated at intervals according to the patient’s response; max. single dose 100 mg

Kenalog® Intra-articular/Intramuscular (Squibb) injection (aqueous suspension), triamcinolone acetonide 40 mg/mL, net price 1- mL vial = £1.49.

Label: 10, steroid card

6.4.3.3.6 Contraceptive effects

Risk of breast cancer  It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment, see HRT Risk table, p. 450 for details. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

Risk of endometrial cancer  The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT, see HRT Risk table, p. 450 for details.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity natural oestrogens (estradiol (oestradiol), estrone (oestrone), and estriol (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than synthetic oestrogens (ethinylestradiol (ethinyloestradiol) and mestranol). Tibolone has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis (section 6.6.1) but other drugs (section 6.6) are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation (section 7.2.1) used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern (section 6.6).

Clonidine (section 2.5.2 and section 4.7.4.2) may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table, p. 450. The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered (section 6.6). HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

Risk of endometrial cancer  The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT, see HRT Risk table, p. 450 for details.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of breast cancer  It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment, see HRT Risk table, p. 450 for details. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

6.6 Endocrine system
Risk of ovarian cancer
Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer, see HRT Risk table, below for details; this excess risk disappears within a few years of stopping.

Risk of venous thromboembolism
Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use, see HRT Risk table, below for details.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. See below for advice on surgery.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis, see under Travel in section 7.3.1.

Risk of stroke
Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment, see HRT Risk table, below for details.

Risk of coronary heart disease
HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause, see HRT Risk table, below for details. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Choice
The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic effects).

Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference.

Taken from MHRA/CHM (Drug Safety Update 2007; 1 (2): 2–6) available at www.mhra.gov.uk/drugsafetyupdate

1. Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
2. Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
3. The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
4. Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
5. Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
6. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
7. Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
8. There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.
activity in a single preparation). Continuous combined preparations or bironale are not suitable for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or it may be given by subcutaneous or transdermal administration, which avoids first-pass metabolism. In the case of subcutaneous implants, recurrence of vasomotor symptoms at supraphysiological plasma concentrations may occur; moreover, there is evidence of prolonged endometrial stimulation after discontinuation (calling for continued cyclical progestogen). For the use of topical HRT preparations see section 7.2.1.

**Contraception**

HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill (section 7.3.1) to provide both relief of menstrual symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary.

Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone necessarily preclude the possibility of becoming pregnant.

**Surgery**

Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a contraindication; factors predisposing to thromboembolism may be exacerbated; history of endometriosis may be exacerbated; history of endometrial hyperplasia; factors predisposing to thromboembolism (see notes above); presence of antiphospholipid antibodies (increased risk of thrombotic events); increased risk of gall-bladder disease reported; hypophysal tumours; acute porphyria (see section 9.8.2). Interactions: Appendix 1 (oestrogens)

Other conditions

The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**Contra-indications**

Oestrogen-dependent cancer, history of breast cancer, active thrombophlebitis, active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction), venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment), liver disease (where liver function tests have failed to return to normal), Dubin-Johnson andRotor syndromes (or monitor closely), untreated endometrial hyperplasia, undiagnosed vaginal bleeding.

**Hepatic impairment**

See Combined Hormonal Contraceptives, section 7.3.1

**Renal impairment**

See Other Conditions, above

**Pregnancy**

See Combined Hormonal Contraceptives, section 7.3.1

**Breast-feeding**

See Combined Hormonal Contraceptives, section 7.3.1

**Side-effects**

See notes above for risks of long-term use; nausea and vomiting, abdominal cramps and bloating, weight changes, breast enlargement and tenderness, premenstrual-like syndrome, sodium and fluid retention, cholestatic jaundice, glucose intolerance, altered blood lipids—may lead to pancreatitis, rashes and chloasma, changes in libido, depression, mood changes, headache, migraine, dizziness, leg cramps (rule out venous thrombosis), vaginal candidiasis, contact lenses may irritate; transdermal delivery systems may cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure), and headache has been reported on vigorous exercise.

**Withdrawal bleeding**

Cyclical HRT (where a progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

**Dose**

- See under preparations

**Counselling on patches**

Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site, recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.
Conjugated oestrogens with progestogen

For prescribing information on progestogens, see section 6.4.1.2

Premique® (Wyeth) [BNF]

Premique® Low Dose tablets, m/r, ivory, s/c, conjugated oestrogen (equine) 300 micrograms and medroxyprogesterone acetate 1.5 mg, net price 3 × 28-tab pack = £6.52

Dose  menopausal symptoms in women with a uterus, 1 tablet daily continuously

Premique® tablets, s/c, blue, conjugated oestrogen (equine) 625 micrograms and medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £10.61

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously

Prempak-C® (Wyeth) [BNF]

Prempak C® 0.625 Calendar pack, s/c, 28 maroon tablets, conjugated oestrogens (equine) 625 micrograms; 12 light brown tablets, noregestrel 150 micrograms (equiv levonorgestrel 75 micrograms), net price 3 × 40-tab pack = £6.25

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), and 1 brown tablet daily on days 17–28 of each 28-day treatment cycle; subsequent courses are repeated without interval

Prempak C® 1.25 Calendar pack, s/c, 28 yellow tablets, conjugated oestrogens (equine) 1.25 mg; 12 light brown tablets, noregestrel 150 micrograms (equiv levonorgestrel 75 micrograms), net price 3 × 40-tab pack = £7.40

Dose  see under 0.625 Calendar pack, but taking 1 yellow tablet daily continuously (instead of 1 maroon tablet) if symptoms not fully controlled with lower strength

Estradiol with progestogen

For prescribing information on progestogens, see section 6.4.1.2

Angeliq® (Bayer Schering) [BNF]

Tablets, f/c, red, estradiol 1 mg, drospirenone 2 mg, net price 3 × 28-tab pack = £24.32

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously; 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

Cautions  use with care if an increased concentration of potassium might be hazardous

Renal impairment  avoid if eGFR less than 30 mL/minute/1.73m²

Climagest® (Novartis) [BNF]

Climagest® 1-mg tablets, 16 grey-blue, estradiol valerate 1 mg; 12 white, estradiol valerate 1 mg and norethisterone 1 mg, net price 28-tab pack = £4.59; 3 × 28-tab pack = £13.35

Dose  menopausal symptoms, 1 grey-blue tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 white tablet daily for 12 days; subsequent courses are repeated without interval

Climagest® 2-mg tablets, 16 blue, estradiol valerate 2 mg; 12 yellow, estradiol valerate 2 mg and norethisterone 1 mg, net price 28-tab pack = £4.59; 3 × 28-tab pack = £13.35

Dose  see Climagest® 1-mg, but starting with 1 blue tablet daily (instead of 1 grey-blue tablet) if symptoms not controlled with lower strength

Climesse® (Novartis) [BNF]

Tablets, pink, estradiol valerate 2 mg, norethisterone 700 micrograms, net price 1 × 28-tab pack = £8.27; 3 × 28-tab pack = £24.82

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously; 1 tablet daily continuously

Clinorette® (ReSource Medical) [BNF]

Tablets, f/c, 16 white, estradiol 2 mg; 12 pink, estradiol 2 mg and norethisterone 1 mg, net price 3 × 28-tab pack = £9.23

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 16 days starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 pink tablet daily for 12 days; subsequent courses repeated without interval

Cyclo-Progynova® (Meda) [BNF]

Cyclo-Progynova® 2-mg tablets, s/c, 11 white, estradiol valerate 2 mg; 10 brown, estradiol valerate 2 mg and norgestrel 500 micrograms (equiv levonorgestrel 250 micrograms), net price per pack = £3.11

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus, 1 tablet daily for 11 days, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 brown tablet daily for 10 days, followed by a 7-day tablet-free interval

Elleste-Duet® (Meda) [BNF]

Elleste-Duet® 1-mg tablets, 16 white, estradiol 1 mg; 12 green, estradiol 1 mg and norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.16

Dose  menopausal symptoms, 1 white tablet daily for 16 days starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 green tablet daily for 12 days; subsequent courses are repeated without interval

Elleste-Duet® 2-mg tablets, 16 orange, estradiol 2 mg; 12 grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.72

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 orange tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 12 days; subsequent courses are repeated without interval

Elleste-Duet Conti® tablets, f/c, grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £16.93

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously; 1 tablet daily on a continuous basis (if changing from cyclical HRT begin treatment at the end of scheduled bleed)

Evorel® (Janssen-Cilag) [BNF]

Evorel® Conti patches, self-adhesive, (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £13.00, 24-patch pack = £57.22. Counselling, administration

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 patch to be applied twice weekly continuously

Evorel® Sequi combination pack, 4 self-adhesive patches of Evorel® 50 (releasing estradiol approx. 50 micrograms/24 hours) and 4 self-adhesive patches of Evorel® Conti (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £11.09. Counselling, administration

Dose  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 Evorel® 50 patch to be applied twice weekly for 2 weeks, starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), followed by 1 Evorel® Conti patch twice weekly for 2 weeks; subsequent courses are repeated without interval
**Femapak® (Abbott Healthcare)**  
*Femapak® 40 combination pack of 8 self-adhesive patches of Fematrix® 40 (releasing estradiol approx. 40 micrograms/24 hours) and 14 tablets of dydrogesterone 10 mg, net price per pack = £7.61. Counselling, administration  
*Dose see under Femapak® 80  
*Femapak® 80 combination pack of 8 self-adhesive patches of Fematrix® 80 (releasing estradiol approx. 80 micrograms/24 hours) and 14 tablets of dydrogesterone 10 mg, net price per pack = £8.06. Counselling, administration  
*Dose* menopausal symptoms and (osteoporous prophylaxis (see section 6.6) in case of Femapak® 80 only), in women with a uterus, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), apply 1 patch twice weekly continuously and take 1 tablet daily on days 15–28 of each 28-day treatment cycle. Therapy should be initiated with Femapak® 40 in those with menopausal symptoms, prolonged oestrogen deficiency or anticipated intolerance to higher strengths, subsequently adjusted to lowest effective dose.

**Femoston® (Abbott Healthcare)**  
*Femoston® 1/10 tablets, f/c, 14 white, estradiol 1 mg; 14 grey, estradiol 1 mg, dydrogesterone 10 mg, net price 3 x 28-tab pack = £13.47  
*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 14 days; subsequent courses repeated without interval if cycles have ceased or are infrequent). Then 1 tablet daily in sequence (without interruption) starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent). Then 1 tablet daily in sequence (without interruption) if cycles have ceased or are infrequent. Then 1 tablet daily in sequence (without interruption) if cycles have ceased or are infrequent. Then 1 tablet daily in sequence (without interruption) if cycles have ceased or are infrequent. Then 1 tablet daily in sequence (without interruption) if cycles have ceased or are infrequent. Then 1 tablet daily in sequence (without interruption) if cycles have ceased or are infrequent.

**Femoston® 2/10 tablets, f/c, 14 red, estradiol 2 mg; 14 yellow, estradiol 2 mg, dydrogesterone 10 mg, net price 3 x 28-tab pack = £13.47  
*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 red tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 yellow tablet daily for 14 days; subsequent courses repeated without interval; where therapy required for menopausal symptoms alone, Femoston® 1/10 given initially and Femoston® 2/10 substituted if symptoms not controlled.

**Femoston®-conti tablets, f/c, salmon, estradiol 1 mg, dydrogesterone 5 mg, net price 3 x 28-tab pack = £22.44  
*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 red tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 yellow tablet daily for 14 days; subsequent courses repeated without interval; where therapy required for menopausal symptoms alone, Femoston® 1/10 given initially and Femoston® 2/10 substituted if symptoms not controlled.

**FemSeven® Conti (Merck Serono)**  
*Patches, self-adhesive (releasing estradiol approx. 50 micrograms/24 hours) and levonorgestrel approx. 7 micrograms/24 hours), net price 4-patch pack = £15.46, 12-patch pack = £44.12. Counselling, administration  
*Dose* menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously. 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase).

**FemSeven® Sequi (Merck Serono)**  
*Combination pack, self-adhesive patches of FemSeven® Sequi Phase 1 (releasing estradiol approx. 50 micrograms/24 hours) and of FemSeven® Sequi Phase 2 (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 10 micrograms/24 hours); net price 1-month pack (2 of each) = £13.16, 3-month pack (6 of each) = £37.54. Counselling, administration  
*Dose* menopausal symptoms in women with a uterus, 1 Phase 1 patch applied once a week for 2 weeks followed by 1 Phase 2 patch once a week for 2 weeks; subsequent courses are repeated without interval.

**Indivina® (Orion)**  
*Indivina® 1 mg/2.5 mg tablets, estradiol valerate 1 mg, medroxyprogesterone acetate 2.5 mg, net price 3 x 28-tab pack = £20.58.  
Indivina® 1 mg/5 mg tablets, estradiol valerate 1 mg, medroxyprogesterone acetate 5 mg, net price 3 x 28-tab pack = £20.58.

**Indivina® 2 mg/5 mg tablets, estradiol valerate 2 mg, medroxyprogesterone acetate 5 mg, net price 3 x 28-tab pack = £20.58.**

*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 3 years previously, 1 tablet daily continuously; initiate therapy with Indivina® 1 mg/2.5 mg tablets and adjust according to response, start at end of scheduled bleed if changing from cyclical HRT.

**Kliofem® (Novo Nordisk)**  
*Tablets, f/c, yellow, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 x 28-tab pack = £11.43.  
*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT.

**Kliovance® (Novo Nordisk)**  
*Tablets, f/c, estradiol 1 mg, norethisterone acetate 500 micrograms, net price 3 x 28-tab pack = £13.20.  
*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT.

**Novofem® (Novo Nordisk)**  
*Tablets, f/c, pink, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 x 28-tab pack = £15.89.  
*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase.

**Nuvelle® Continuous (Bayer Schering)**  
*Tablets, f/c, pink, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 x 28-tab pack = £15.89.  
*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase.

**Tridestra® (Orion)**  
*Tablets, 70 white, estradiol valerate 2 mg; 14 blue, estradiol valerate 2 mg and medroxyprogesterone acetate 20 mg; 7 yellow, inactive, net price 91-tab pack = £20.49.  
*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 70 days, then 1 blue tablet daily for 14 days, then 1 yellow tablet daily for 7 days; subsequent courses are repeated without interval.

**Trisequens® (Novo Nordisk)**  
*Tablets, 12 blue, estradiol 2 mg; 10 white, estradiol 2 mg, norethisterone acetate 1 mg; 6 red, estradiol 1 mg, net price 3 x 28-tab pack = £11.10.  
*Dose* menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 blue tablet daily, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily in sequence (without interruption).
### Conjugated oestrogens only

**Premarin® (Wyeth)**

- Tablets, all s/c, conjugated oestrogens (equine)
  - 300 micrograms (green): net price 3 × 28-tab pack = £6.07; 625 micrograms (maroon), 3 × 28-tab pack = £4.02; 1.25 mg (yellow), 3 × 28-tab pack = £3.38
- **Dose**: menopausal symptoms, 0.3–1.25 mg daily continuously; osteoporosis prophylaxis (see section 6.6), 0.625–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus.

**Estradiol only**

**Estradiol Implants** (Organon)

- **Implant**: estradiol 25 mg, net price each = £12.47; 50 mg, each = £20.29
- **Dose**: by implantation, oestrogen replacement, and osteoporosis prophylaxis (see section 6.6) (with cyclical progestogen for 12–14 days of each cycle in women with a uterus, see notes above), 25–100 mg as required (usually every 4–6 months) according to oestrogen levels—check before each implant
- **Note**: On cessation of treatment if or if implants are removed from those with a uterus, cyclical progestogen should be continued until withdrawal bleed stops

**Bedol® (ReSource Medical)**

- **Tablets**: t/c, estradiol 2 mg, net price 3 × 28-tab pack = £5.07
- **Dose**: menopausal symptoms and osteoporosis prophylaxis (see section 6.6), with cyclical progestogen for 12–14 days of each cycle in women with a uterus; for cycles have ceased or are infrequent, with cyclical progestogen for at least 12 days of each cycle in women with a uterus; subsequently adjust according to response

**Climaval® (Novartis)**

- **Tablets**: estradiol valerate 1 mg (grey-blue), net price 1 × 28-tab pack = £2.45, 3 × 28-tab pack = £7.35; 2 mg (blue), 1 × 28-tab pack = £2.45, 3 × 28-tab pack = £7.35
- **Dose**: menopausal symptoms (if patient has had a hysterectomy), 1–2 mg daily

**Elleste-Solo® (Meda)**

- **Elleste-Solo® 1-mg tablets**: estradiol 1 mg, net price 3 × 28-tab pack = £5.03
- **Dose**: menopausal symptoms with cyclical progestogen for 12–14 days of each cycle in women with a uterus; 1 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

**Elleste-Solo® 2-mg tablets**: orange, estradiol 2 mg, net price 3 × 28-tab pack = £5.34
- **Dose**: menopausal symptoms not controlled with lower strength and osteoporosis prophylaxis (see section 6.6), with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 2 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

**Elleste Solo® MX (Meda)**

- **Patches**: self-adhesive, estradiol, MX 40 patch (releasing approx. 40 micrograms/24 hours), net price 8-patch pack = £5.19; MX 80 patch (releasing approx. 80 micrograms/24 hours), 8-patch pack = £5.99
- **Dose**: menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent); with cyclical progestogen for at least 12 days of each cycle in women with a uterus; subsequently adjust according to response

**Estradot® (Novartis)**

- **Patches**: self-adhesive, estradiol, 25 patch (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £4.16; ’37.5’ patch (releasing approx. 37.5 micrograms/24 hours), 8-patch pack = £4.17; ’50’ patch (releasing approx. 50 micrograms/24 hours), 8-patch pack = £4.18; ’75’ patch (releasing approx. 75 micrograms/24 hours), 8-patch pack = £4.86; ’100’ patch (releasing approx. 100 micrograms/24 hours), 8-patch pack = £5.05
- **Dose**: menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously after 100 mg as required (usually every 4–6 months) according to oestrogen levels—check before each implant

**Evorel® (Janssen-Cilag)**

- **Patches**: self-adhesive, estradiol, 25 patch (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £3.42; ’50’ patch (releasing approx. 50 micrograms/24 hours), 8-patch pack = £3.88
- **Dose**: menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent); with cyclical progestogen for at least 12 days of each cycle in women with a uterus; subsequently adjust according to response

**Femstatix® (Abbott Healthcare)**

- **Patches**: self-adhesive, estradiol, 40 patch (releasing approx. 40 micrograms/24 hours), net price 8-patch pack = £4.95; ’80’ patch (releasing approx. 80 micrograms/24 hours), 8-patch pack = £5.40
- **Dose**: menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if...
Oestrogel® (Ferring) (GBP)

Gel, estradiol 0.06%, net price 64-dose pump pack = £4.80. Counselling, administration

Dose
menopausal symptoms and osteoporosis prophylaxis (see section 6.6). 1 patch to be applied once a week continuously, with cyclical progestogen for at least 12 days of each cycle in women with a uterus; for menopausal symptoms may continue with this strength for osteoporosis prophylaxis in women at risk of fractures (second-line)

Cautions
see Hormone Replacement Therapy, p. 449 and under Oestrogens for HRT; vaginal bleeding (investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment); history of liver disease, epilepsy, migraine, diabetes mellitus, hypercholesterolaemia; withdraw if signs of thromboembolic disease, abnormal liver function tests or cholestatic jaundice; see also Note below; interactions: Appendix 1 (tibolone)

Contra-indications see notes above and under Oestrogens for HRT; hormone-dependent tumours, history of cardiovascular or cerebrovascular disease (e.g. thrombophlebitis, thromboembolism), uninvestigated vaginal bleeding

Hepatic impairment avoid in severe impairment

Renal impairment risk of fluid retention—patients with renal impairment should be closely monitored

Pregnancy avoid, toxicity in animal studies

Breast-feeding avoid

Side-effects see notes above; also abdominal pain, weight changes, vaginal bleeding, leucorrhoea, facial hair, and rarely amenorrhea; gastro-intestinal disturbances, oedema, dizziness, headache, migraine, depression, breast cancer (see notes above and section 6.4.1.1), arthralgia, myalgia, visual disturbances, seborrhoeic dermatitis, rash and pruritus also reported

Dose
0.1 mg daily

Note Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive; also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding); induce withdrawal bleed with progestogen if transferring from another form of HRT

Livial® (Organon) (GBP)

Tablets, tibolone 2.5 mg, net price 28-tab pack = £10.36; 3 x 28-tab pack = £31.08
Ethinylestradiol

Ethinylestradiol (ethinylestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs (section 6.6) cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under specialist supervision for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited). Side-effects include nausea, fluid retention, and thrombosis. Impotence and gynaecomastia have been reported in men.

For use in prostate cancer, see section 8.3.1.

**ETHINYLESTRADIOL**

**Indications** see notes above

**Cautions** cardiovascular disease (sodium retention with oedema, thromboembolism); see also under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 451)

**Contra-indications** see under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 451)

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives, section 7.3.1

**Pregnancy** see Combined Hormonal Contraceptives, section 7.3.1

**Breast-feeding** see Combined Hormonal Contraceptives, section 7.3.1

**Side-effects** feminising effects in men; see also under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 451)

**Dose**

- Menopausal symptoms and osteoporosis prophylaxis, (with progestogen for 12–14 days per cycle in women with intact uterus), 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period
- Female hypogonadism, 10–50 micrograms daily, usually on cyclical basis; initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy
- Menstrual disorders, 20–50 micrograms daily from day 5 to 25 of each cycle, with progestogen added either throughout the cycle or from day 15 to 25

**Ethinylestradiol**

Tablets, ethinylestradiol 10 micrograms, net price 21-tab pack = £29.95; 50 micrograms, 21-tab pack = £38.20; 1 mg, 28-tab pack = £49.50

**Raloxifene**

**Indications** treatment and prevention of postmenopausal osteoporosis

**Cautions** risk factors for venous thromboembolism (discontinue if prolonged immobilisation); risk factors for stroke; breast cancer (see notes above); history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides); **interactions**: Appendix 1 (raloxifene)

**Contra-indications** history of venous thromboembolism, undiagnosed uterine bleeding, endometrial cancer, cholestasis

**Hepatic impairment** avoid

**Renal impairment** caution in mild to moderate impairment; avoid in severe impairment

**Side-effects** hot flushes, leg cramps, peripheral oedema, influenza-like symptoms; less commonly venous thromboembolism, thrombophlebitis; rarely rashes, gastrointestinal disturbances, hypertension, arterial thromboembolism, headache (including migraine), breast discomfort, thrombocytopenia

**Dose**

- 60 mg once daily

Evista® (Daiichi Sankyo) Tablets, f/c, raloxifene hydrochloride 60 mg, net price 28-tab pack = £17.06; 84-tab pack = £59.59

**Progestogens**

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxy-progesterone) and testosterone analogues (noretosterone and norgestrel). The newer progestogens (desogestrel, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol and gonadorelin analogues are also available (section 6.7.2).

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid (section 2.11) or, particularly where dysmenorrhoea is also a factor, mefenamic acid (section 10.1.1); the levonorgestrel-releasing intrauterine system (section 7.3.2.3) may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive (section 7.3.1).

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown. Progestogens have been used for the prevention of spontaneous abortion in women with a history of recurrent miscarriage (habitual abortion) but there is no evidence of benefit and they are not recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose
apart from aspirin (section 2.9) and a prophylactic dose of a low molecular weight heparin (section 2.8.1) may decrease the risk of fetal loss (use under specialist supervision only).

**Hormone replacement therapy** In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis (see section 6.4.1.1). Combined packs incorporating suitable progestogen tablets are available, see p. 452.

**Oral contraception** Desogestrel, etynodiol (ethynodiol), gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives (section 7.3.2).

**Diabetes** should be monitored closely. For gens can decrease glucose tolerance and patients with epilepsy, hypertension, migraine, asthma, or cardiac dysfunctions (including urticaria, pruritus, rash, and acne), weight change, nausea, headache, dizziness, insomnia, drowsiness, depression, change in libido; also skin reactions (including bloating, fluid retention, breast tenderness), menstrual disturbances, premenstrual-like syndrome, hirsutism and alopecia. Jaundice and anaphylactoid reactions have also been reported.

**MEDROXYPROGESTERONE ACETATE**

**Indications** see under Dose; contraception (section 7.3.2.2); malignant disease (section 8.3.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** section 8.3.2

**Renal impairment** use with caution

**Pregnancy** section 8.3.2

**Breast-feeding** section 8.3.2

**Side-effects** see notes above; indigestion

**Dose**

- By mouth, 2.5–10 mg daily for 5–10 days beginning on day 16 to 21 of cycle, repeated for 2 cycles in dysfunctional uterine bleeding and 3 cycles in secondary amenorrhoea
- Mild to moderate endometriosis, 10 mg 3 times daily for 90 consecutive days, beginning on day 1 of cycle
- Progestogenic opposition of oestrogen HRT, 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

**Provera® (Pharmacia)**

- Tablets, all scored, medroxyprogesterone acetate 2.5 mg (orange), net price 30-tab pack = £1.84; 5 mg (blue), 10-tab pack = £1.23; 10 mg (white), 10-tab pack = £2.47, 90-tab pack = £22.16

**Climanor® (Resourke Medical)**

- Tablets, f/c, medroxyprogesterone acetate 5 mg, net price 28-tab pack = £3.27

**Combined preparations**

- See Appendix 1 (progestogens).

**Contra-indications** Progestogens should be avoided in patients with a history of liver tumours. They are also contra-indicated in those with genital or breast cancer (unless progestogens are being used in the management of these conditions), severe arterial disease, undiagnosed vaginal bleeding and acute porphyria (section 9.8.2). Progestogens should not be used if there is a history during pregnancy of idiopathic jaundice, severe pruritus, or pemphigoid gestationis.

**Side-effects** Side-effects of progestogens include menstrual disturbances, premenstrual-like syndrome (including bloating, fluid retention, breast tenderness), weight change, nausea, headache, dizziness, insomnia, drowsiness, depression, change in libido; also skin reactions (including urticaria, pruritus, rash, and acne), hirsutism and alopecia. Jaundice and anaphylactoid reactions have also been reported.

**NORETHISTERONE**

**Indications** see under Dose; HRT (section 6.4.1.1); contraception (section 7.3.1 and section 7.3.2); malignant disease (section 8.3.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** section 8.3.2

**Renal impairment** use with caution

**Pregnancy** section 8.3.2

**Breast-feeding** section 8.3.2

**Side-effects** see notes above

**Dose**

- Endometriosis, by mouth, 10–15 mg daily for 4–6 months or longer, starting on day 5 of cycle (if spotting occurs increase dose to 20–25 mg daily; reduced once bleeding has stopped)
- Dysfunctional uterine bleeding, menorrhagia (but see notes above), by mouth, 5 mg 3 times daily for 10 days to arrest bleeding; to prevent bleeding 5 mg twice daily from day 19 to 26
- Dysmenorrhoea (but see notes above), by mouth, 5 mg 3 times daily from day 5 to 24 for 3–4 cycles
- Premenstrual syndrome (but not recommended, see notes above), by mouth, 5 mg 2–3 times daily from day 19 to 26 for several cycles
- Postponement of menstruation, by mouth, 5 mg 3 times daily starting 3 days before expected onset (menstruation occurs 2–3 days after stopping)
6.4.2 Male sex hormones and antagonists

**PROGESTERONE**

**Indications** see under preparations

**Cautions** see notes above

**Contra-indications** see notes above; missed or incomplete abortion

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives, section 7.3.1

**Renal impairment** use with caution

**Pregnancy** not known to be harmful

**Breast-feeding** avoid—present in milk

**Side-effects** see notes above; injection-site reactions; pain, diarrhoea and flatulence can occur with rectal administration

**Dose**

- See under preparations

**Crinone** (Merck Serono)

- **Vaginal gel**, progesterone 90 mg/application (8%), 15 = £30.83

- **Dose** by vagina, infertility due to inadequate luteal phase, insert 1 applicatorful daily starting either after documented ovulation or on day 18–21 of cycle. *In vitro* fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

**Cyclogest** (Actavis)

- **Pessaries**, progesterone 200 mg, net price 15 = £7.03; 400 mg, 15 = £10.18

- **Dose** by vagina or rectum, premenstrual syndrome and postnatal depression, 200 mg daily to 400 mg twice daily; for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended, see notes above); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

**Gestone** (Nordic)

- **Injection**, progesterone 50 mg/mL, net price 1 mL amp = £4.50, 2 mL amp = £4.50

- **Dose** by deep intramuscular injection into buttock: dysfunction uterine bleeding, 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation

- Recurrent miscarriage due to inadequate luteal phase (but not recommended, see notes above) or following *in vitro* fertilisation or gamete intra-fallopian transfer, 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy; max. 200 mg daily

**Utrogestan** (Perring)

- **Capsules**, progesterone (micronised) 100 mg, net price 30-cap pack = £5.13; 200 mg 15-cap pack = £5.13. Counselling, administration

- **Excipients** include arachis (peanut) oil

- **Dose** progesterone opposition of oestrogen HRT 200 mg once daily on days 15–26, or 100 mg once daily on days 1–25, of each 28-day oestrogen HRT cycle

---

**TESTOSTERONE AND ESTERS**

**Indications** see under preparations

**Cautions** cardiac impairment, elderly, ischaemic heart disease, hypertension, epilepsy, migraine, diabetes mellitus, skeletal metastases (risk of hypercalcaemia), undertake regular examination of the prostate and breast during treatment; monitor full blood count, lipid profile and liver function; pre-pubertal boys (see notes above and under Side-effects); interactions: Appendix 1 (testosterone)

**Contra-indications** breast cancer in men, prostate cancer, history of primary liver tumours, hypercalcaemia, nephrotic syndrome

**Hepatic impairment** avoid if possible—fluid retention and dose-related toxicity

**Renal impairment** caution—potential for fluid retention

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids (section 6.4.3).

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone (section 6.5.1) which will stimulate spermatogenesis as well as androgen production.

Caution should be used when androgens or chorionic gonadotrophin are used in treating boys with delayed puberty since the fusion of epiphyses is hastened and may result in short stature; skeletal maturation should be monitored.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively *Sustanon®,* which consists of a mixture of testosterone esters and has a longer duration of action, may be used. Satisfactory replacement therapy can sometimes be obtained with 1 mL of *Sustanon 250®,* given by intramuscular injection once a month, although more frequent dose intervals are often necessary. Impacts of testosterone can be used for hypogonadism; the implants are replaced every 4 to 5 months.

Testosterone implants can be used in postmenopausal women as an adjunct to hormone replacement therapy. A testosterone patch is also licensed to improve libido in surgically induced menopausal women (receiving concomitant oestrogen therapy).
Pregnancy  avoid; causes masculinisation of female fetus  
Breast-feeding  avoid; may cause masculinisation in the female infant or precocious development in the male infant; high doses suppress lactation  
Side-effects  prostate abnormalities and prostate cancer, headache, depression, gastro-intestinal bleeding, nausea, vomiting, cholestatic jaundice, changes in libido, gynaecomastia, polycystic ovaries, anxiety, irritability, nervousness, anemia, parasympathetic, hypertension, electrolyte disturbances including sodium retention with oedema and hypercalcaemia, weight gain; increased bone growth, muscle cramps, arthralgia; androgenic effects such as hirsutism, male-pattern baldness, seborrhoea, acne, pruritus, excessive frequency and duration of penile erection, precocious sexual development and premature closure of epiphyses in pre-pubertal males, suppression of spermatogenesis in men and virilism in women; rarely liver tumours; sleep apnoea also reported; with patches, buccal tablets, and gel, local irritation and allergic reactions (including burn-like lesions with patches), and taste disturbances  

Dose  
- See under preparations  

Oral  
Restandol® Testocaps (Organon) caps, orange, testosterone undecanoate 40 mg in oily solution, net price 30-cap pack = £8.55; 60-cap pack = £17.10. Label: 21, 25  
Dose androgen deficiency, 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily  

Buccal  
Striant® SR (The Urology Co.) mucoadhesive buccal tablets, m/t, testosterone 30 mg, net price 60-tab pack = £45.84. Counselling, see under Dose below  
Dose hypoandrogenism, 30 mg every 12 hours; CHILD and ADOLESCENT under 18 years not recommended. Counselling Place rounded side of tablet on gum above front teeth and hold lip firmly over the gum for 30 seconds. If tablet detaches within 4 hours of next dose, replace with new tablet which is considered the second dose for the day.  

Intramuscular  
Testosterone Enantate (Non-proprietary) Injection (oily), testosterone enantate 250 mg/mL, net price 1-mL amp = £13.33  
Dose by slow intramuscular injection, hypogonadism, initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks Breast cancer, 250 mg every 2–3 weeks  

Nebido® (Bayer Schering) Injection (oily), testosterone undecanoate 250 mg/mL, net price 4-mL amp = £76.70  
Dose by deep intramuscular injection, hypogonadism in men over 18 years, 1 g every 14–10 weeks; if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks  

Sustanon 250® (Organon) Injection (oily), testosterone propionate 30 mg, testosterone phenylpropionate 60 mg, testosterone isocaproate 60 mg, and testosterone decanoate 100 mg/mL, net price 1-mL amp = £2.45  
Excipients include arachis (peanut) oil, benzyl alcohol (see Excipients p. 2)  
Dose by deep intramuscular injection, androgen deficiency. 1 mL usually every 3 weeks  

Viorormone® (Nordic) Injection, testosterone propionate 50 mg/mL, net price 2-mL amp = £4.50  
Dose by intramuscular injection, androgen deficiency. 50 mg 2–3 times weekly  
Delayed puberty, 50 mg weekly  
Breast cancer in women, 100 mg 2–3 times weekly  

Implant  
Testosterone (Organon) Implant, testosterone 100 mg, net price = £7.40; 200 mg = £13.79.  
Dose by implantation, male hypogonadism, 100–600 mg; 600 mg usually maintains plasma-testosterone concentration within the normal range for 4–5 months  
Postmenopausal women, 50–100 mg every 4–8 months, as an adjunct to oestrogen replacement therapy  

Transdermal preparations  
Intrinsa® (Warner Chilcott) Patches, self-adhesive, releasing testosterone approx. 300 micrograms/24 hours, net price 8-patch pack = £26.91. Counselling, administration  
Dose hyposexual sexual desire disorder associated with surgically induced menopause (in women receiving concomitant oestrogen therapy (section 6.4.1.1)), apply 1 patch twice weekly continuously to clean, dry, unbroken skin on lower abdomen below waistline; site replacement patch on a different area (avoid using same area for 7 days); assess treatment after 3–6 months, discontinue if no benefit  
Note Not recommended for women naturally menopausal or those taking conjugated oestrogens: Safety and efficacy of use beyond 1 year not established  
Testim® (Ferring) Gel, testosterone 50 mg/5 g tube, net price 30-tube pack = £32.00. Counselling, administration  
Excipients include propylene glycol (see section 13.1.3)  
Dose hypogonadism due to testosterone deficiency in men (over 18 years), 50 mg testosterone (5 g gel) applied once daily; subsequent application adjusted according to response; max. 100 mg (10 g gel) daily  
Counselling Squeeze entire content of tube onto one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm), rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours  
Avoid skin contact with application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature  
Testogel® (Bayer Schering) Gel, testosterone 50 mg/5 g sachet, net price 30-sachet pack = £31.11. Counselling, administration  
Dose hypogonadism due to androgen deficiency in men (over 18 years), 50 mg testosterone (5 g gel) to be applied once daily; subsequent application adjusted according to response in 25-mg (2.5 g gel) increments to max. 100 mg (10 g gel) daily  
Counselling Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen. Immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours  
Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature  
Tostran® (ProStrakan) Gel, testosterone 2% (10 mg metered application), net price 60-g multidose dispenser = £26.67. Counselling, administration  
Excipients include butylhydroxytoluene, propylene glycol (see section 13.1.3)  
Dose hypogonadism due to testosterone deficiency in men (over 18 years), initially 60 mg testosterone (3 g gel) applied
once daily; subsequent applications adjusted according to response; max. 80 mg (4 g gel) daily

Counselling Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

MESTEROLONE

Indications see under Dose

Cautions see under Testosterone and Esters

Contra-indications see under Testosterone and Esters

Hepatic impairment see under Testosterone and Esters

Renal impairment see under Testosterone and Esters

Pregnancy see under Testosterone and Esters

Breast-feeding see under Testosterone and Esters

Side-effects see under Testosterone and Esters but spermatogenesis unimpaired

Dose

• Androgen deficiency and male infertility associated with hypogonadism, 25 mg 3–4 times daily for several months, reduced to 50–75 mg daily in divided doses for maintenance; CHILD not recommended

Pro-Viron® (Bayer Schering)

Tablets, scored, mesterolone 25 mg. Net price 30-tab pack = £4.19

Anti-androgens

Cyproterone acetate

Cyproterone acetate is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in animal studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also used as an adjunct in prostatic cancer (section 8.3.4.2) and in the treatment of acne and hirsutism in women (section 13.6.2).

CYPROTERONE ACETATE

Indications see notes above; prostate cancer (section 8.3.4.2)

Cautions ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known); blood counts initially and throughout treatment; monitor hepatic function regularly (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; diabetes mellitus (see also Contra-indications)

Driving Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

Contra-indications (do not apply in prostate cancer), severe diabetes (with vascular changes), sickle-cell anaemia, liver-disease including Dubin-Johnson and Rotor syndromes, previous or existing liver tumours, malignant or wasting diseases, meningioma or history of meningioma, severe depression, history of thromboembolic disorders; youths under 18 years (may arrest bone maturation and testicular development)

Hepatic impairment dose-related toxicity; see also side-effects, p. 573

Side-effects fatigue and lassitude, breathlessness, weight changes, reduced sebum production (may clear acne), changes in hair pattern, gynaecomastia (rarely leading to galactorrhoea and benign breast nodules); rarely hypersensitivity reactions, rash and oedema; inhibition of spermatogenesis (see notes above); hepatotoxicity reported (including jaundice, hepatitis and hepatic failure usually in men given 200–300 mg daily for prostate cancer, see section 8.3.4.2 for details and warnings)

Dose

• ADULT over 18 years, male hypersexuality, 50 mg twice daily after food

Cyproterone Acetate (Non-proprietary)

Tablets, cyproterone acetate 50 mg, net price 56-tab pack = £31.54. Label: 21 counselling, driving

Androcure® (Bayer Schering)

Tablets, scored, cyproterone acetate 50 mg, net price 56-tab pack = £24.41. Label: 21 counselling, driving

Dutasteride and finasteride

Dutasteride and finasteride are specific inhibitors of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone. This inhibition of testosterone metabolism leads to reduction in prostate size, with improvement in urinary flow rate and in obstructive symptoms. Dutasteride and finasteride are alternatives to alpha-blockers (section 7.4.1) particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men (section 13.9).

Cautions Dutasteride and finasteride decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment. Both dutasteride and finasteride are excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant. Women of childbearing potential should avoid handling crushed or broken tablets of finasteride and leaking capsules of dutasteride.

Side-effects The side-effects of dutasteride and finasteride include impotence, decreased libido, ejaculation disorders, and breast tenderness and enlargement.

DUTASTERIDE

Indications benign prostatic hyperplasia

Cautions see notes above; interactions: Appendix 1 (dutasteride)

Hepatic impairment avoid in severe impairment—no information available

Side-effects see notes above

Dose

• 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

Avodart® (GSK)

Capsules, yellow, dutasteride 500 micrograms, net price 30-cap pack = £19.80. Label: 25

With tamsulosin Section 7.4.1
FINASTERIDE

**Indications** benign prostatic hyperplasia; male-pattern baldness in men (section 13.9)

**Cautions** see notes above; also obstructive uropathy

**Male breast cancer** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge

**Side-effects** see notes above; also testicular pain, hypersensitivity reactions (including lip and face swelling, pruritus and rash); male breast cancer also reported (see Cautions above)

**Dose** 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months’ treatment before benefit is obtained)

Finasteride (Non-proprietary)

Tablets, finasteride 5 mg, net price 28-tab pack = £2.19

Proscar® (MSD)

Tablets, blue, f/c, finasteride 5 mg, net price 28-tab pack = £13.94

6.4.3 Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anaemias (section 9.1.3). Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

NANDROLONE

**Indications** osteoporosis in postmenopausal women (but not recommended, see notes above); aplastic anaemia (section 9.1.3)

**Cautions** cardiac impairment, hypertension, diabetes mellitus, epilepsy, migraine; monitor skeletal maturation in young patients; skeletal metastases (risk of hypercalcaemia); **interactions:** Appendix 1 (anabolic steroids)

**Contra-indications** prostate cancer, male breast cancer, acute porphyria (section 9.8.2)

**Hepatic impairment** use in severe hepatic impairment only if benefit outweighs risk

**Renal impairment** use with caution—may cause sodium and water retention

**Side-effects** acne, sodium retention with oedema, virilisation with high doses including voice changes (sometimes irreversible), amenorrhoea, inhibition of spermatogenesis, premature epiphyseal closure; abnormal liver-function tests reported with high doses; liver tumours reported occasionally on prolonged treatment with anabolic steroids

**Dose** see below

Use of preparations in these sections requires detailed prior investigation of the patient and should be reserved for specialist centres.

Deca-Durabolin® (Organon)

Injection (oily), nandrolone decanoate 50 mg/mL, net price 1-mL amp = £3.17

**Excipients** include arachis (peanut) oil, benzyl alcohol (see **Excipients**, p. 2)

**Dose** by deep intramuscular injection, 50 mg every 3 weeks

6.5 Hypothalamic and pituitary hormones and anti-oestrogens

6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens

6.5.2 Posterior pituitary hormones and antagonists

Anti-oestrogens

The anti-oestrogens clomifene (clomiphene) and tamoxifen (section 8.3.4.1) are used in the treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease). They induce gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct.

Patients should be warned that there is a risk of multiple pregnancy (rarely more than twins).

CLOMIFENE CITRATE

(Clophiphene Citrate)

**Indications** anovulatory infertility—see notes above

**Cautions** see notes above; polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses), ovarian hyperstimulation syndrome, uterine fibroids, ectopic pregnancy, incidence of multiple births increased (consider ultrasound monitoring), visual symptoms (discontinue and initiate ophthalmological examination)

**CSM Advice** The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer)

**Contra-indications** ovarian cysts, hormone-dependent tumours or abnormal uterine bleeding of undetermined cause

**Hepatic impairment** avoid in severe liver disease
6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens BNF 61

**Pregnancy** exclude pregnancy before treatment; possible effects on fetal development

**Breast-feeding** may inhibit lactation

**Side-effects** visual disturbances (withdraw), ovarian hyperstimulation (withdraw), hot flushes, abdominal discomfort, occasionally nausea, vomiting, depression, insomnia, breast tenderness, headache, intestinal spotting, menorrhagia, endometriosis, convulsions, weight gain, rashes, dizziness, hair loss

**Dose**
- 50 mg daily for 5 days, starting within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen-induced withdrawal bleed) if cycles have ceased; second course of 100 mg daily for 5 days may be given in absence of ovulation; most patients who are going to respond will do so to first course; 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended—see CSM advice, above

**Clomifene** (Non-proprietary) Tablets, clomifene citrate 50 mg, net price 30-tab pack = £15.94

**Clomid** (Sanofi-Aventis) Tablets, yellow, scored, clomifene citrate 50 mg. Net price 30-tab pack = £8.46

---

### Anterior pituitary hormones

#### Corticotrophins

**Tetracosactide** (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactrin indicates adrenocortical insufficiency.

Both corticotropin and tetracosactrin were formerly used as alternatives to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis; their use in primary gonadal failure.

- **Dose**
  - 50 mg daily for 5 days
  - Second course of 100 mg daily for 5 days may be given in absence of ovulation; most patients who are going to respond will do so to first course; 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended—see CSM advice, above

**Synacthen** (Alliance) **Injection**, tetracosactride 250 micrograms (as acetate)/mL. Net price 1-mL amp = £2.70

**Dose**
- Diagnostic (30-minute test), by intramuscular or intravenous injection, 250 micrograms as a single dose

**Synacthen Depot** (Alliance) **Injection** (aqueous suspension), tetracosactride acetate 1 mg/mL, with zinc phosphate complex. Net price 1-mL amp = £3.87

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients p.3)

**Dose**
- Diagnostic (5-hour test), by intramuscular injection, 1 mg as a single dose

**Note** Formerly used therapeutically by intramuscular injection, in an initial dose of 1 mg daily (or every 12 hours in acute cases); reduced to 1 mg every 2–3 days, then 1 mg weekly (or 500 micrograms every 2–3 days) but value was limited (see notes above)

#### Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together (as in human menopausal gonadotrophin), follicle-stimulating hormone alone (as in follitropin), or chorionic gonadotrophin, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene, or in superovulation treatment for assisted conception (such as *in vitro* fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligosperma. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone (section 6.4.2).

**CHORIONIC GONADOTROPHIN**

(A Human Chorionic Gonadotrophin; HCG)

A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone

**Indications** see notes above

**Cautions** cardiac impairment, asthma, epilepsy, migraine; prepubertal boys (risk of premature epiphyseal closure or precocious puberty); acute porphyria (section 9.8.2)

**Contra-indications** androgen-dependent tumours

**Renal impairment** use with caution

**Side-effects** oedema (particularly in males—reduce dose), headache, tiredness, mood changes, gynaecomastia, local reactions; may aggravate ovarian hyperstimulation, multiple pregnancy

**Dose**
- By subcutaneous or intramuscular injection, according to patient’s response

**Choragon** (Ferring) **Injection**, powder for reconstitution, chorionic gonadotrophin. Net price 5000-unit amp (with solvent) = £3.26

**Pregnyl** (Organon) **Injection**, powder for reconstitution, chorionic gonadotrophin. Net price 1500-unit amp = £2.12; 5000-unit amp = £3.15 (both with solvent). For subcutaneous or intramuscular injection
CHORIOGONADOTROPIN ALFA
(Human choric gonadotropin)

Indications see notes above

Contra-indications ovarian enlargement or cyst (unless caused by polycystic ovarian disease); ectopic pregnancy in previous 3 months; active thromboembolic disorders; hypothalamus, pituitary, ovarian, uterine or mammary malignancy

Side-effects nausea, vomiting, abdominal pain; headache, tiredness; injection-site reactions; ovarian hyperstimulation syndrome; rarely diarrhoea, depression, irritability, breast pain; ectopic pregnancy and ovarian torsion reported

Dose
- By subcutaneous injection, according to patient's response

OVITRELLE® (Merck Serono)  
Injection, choriogonadotropin alfa, net price 6500-unit/0.5 mL (250-micrograms/0.5 mL) prefilled syringe = £31.38

CORIFOLLITROPIN ALFA

Indications controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist

Contra-indications risk factors for thromboembolism; risk of ovarian hyperstimulation syndrome; acute porphyria (section 9.8.2)

Contra-indications ovarian enlargement or cyst; polycystic ovarian syndrome; tumours of hypothalamus, pituitary, ovaries, uterus, or breast; vaginal bleeding of unknown cause; history of ovarian hyperstimulation syndrome

Renal impairment avoid

Breast-feeding avoid

Side-effects nausea, headache, fatigue; ovarian hyperstimulation, pelvic pain, breast pain; less commonly vomiting, abdominal distension and pain, diarrhoea, constipation, dizziness, ovarian torsion; also reported ectopic pregnancy, miscarriage, and multiple pregnancies

Dose
- By subcutaneous injection, body-weight under 60 kg, 100 micrograms; body-weight over 60 kg, 150 micrograms

ELOVRA® (Organon)  
Injection, prefilled syringe, corifollitropin alfa, net price 100 micrograms/0.5 mL = £638.00; 150 micrograms/0.5 mL = £638.00

FOLLITROPIN ALFA and BETA
(Recombinant human follicle stimulating hormone)

Indications see notes above

Contra-indications acute porphyria (section 9.8.2)

Pregnancy avoid

Breast-feeding avoid

Side-effects see under Human Menopausal Gonadotrophins

Dose
- By subcutaneous injection, according to patient’s response

FOLLITROPIN ALFA

Gonal-F® (Merck Serono)

Injection, powder for reconstitution, follitropin alfa. Net price 75-unit amp = £21.02; 450 units/0.75 mL, multidose vial = £126.10; 1050 units/1.75 mL, multidose vial = £294.22 (all with solvent). For subcutaneous injection

Injection, prefilled pen, follitropin alfa 600 units/mL, net price 0.5 mL (300 units) = £94.00, 0.75 mL (450 units) = £141.00, 1.5 mL (900 units) = £282.00. For subcutaneous injection

FOLLITROPIN ALFA with lutropin alfa

PERGOVERIS® (Merck Serono)

Injection, powder for reconstitution, follitropin alfa 150 units (11 micrograms), lutropin alfa 75 units (3 micrograms), net price per vial (with solvent) = £60.29. For subcutaneous injection

Injection, follitropin beta 100 units/mL, net price 0.5 mL (50-unit) vial = £18.03; 200 units/mL, 0.5 mL (100-unit) vial = £36.06; 300 units/mL, 0.5 mL (150-unit) vial = £50.62; 400 units/mL, 0.5 mL (200-unit) vial = £67.49; 0.36 mL (300-unit) cartridge = £97.41, 0.72 mL (600-unit) cartridge = £194.82, 1.08 mL (900-unit) cartridge = £292.23, (cartridges for use with Pergoveris® pen). For subcutaneous (cartridges and vials) or intramuscular injection (vials)

Excipients may include neomycin and streptomycin

HUMAN MENOPAUSAL GONADOTROPHINS

Indications see notes above

Contra-indications acute porphyria (section 9.8.2)

Pregnancy avoid

Breast-feeding avoid

Side-effects ovarian hyperstimulation, increased risk of multiple pregnancy and miscarriage, hypersensitivity reactions, gastro-intestinal disturbances, headache, joint pain, fever, injection site reactions, very rarely thromboembolism; gynaecomastia, acne, and weight gain reported in men

Dose
- By deep intramuscular or subcutaneous injection, according to patient’s response

Menotrophin

Purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1

Merional® (Pharmasure)

Injection, powder for reconstitution, menotrophin as follicle-stimulating hormone 75 units and luteinising hormone 75 units, net price per vial (with solvent) = £13.95; follicle-stimulating hormone 150 units, luteinising hormone 150 units, net price per vial (with solvent) = £27.90. For intramuscular injection
Menopur® (Feringa)
Injection, powder for reconstitution, menotrophin as follicle-stimulating hormone 75 units and luteinising hormone 75 units, net price per vial (with solvent) = £13.38. For intramuscular or subcutaneous injection.

Urofollitropin
Purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH).

Fostimon® (Pharmasure)
Injection, powder for reconstitution, urofollitropin as follicle-stimulating hormone 75 units, net price per vial (with solvent) = £27.90; follicle-stimulating hormone 150 units, net price per vial (with solvent) = £55.80. For intramuscular or subcutaneous injection.

LUTROPIN ALFA (Recombinant human luteinising hormone)
Indications see notes above.

Cautions acute porphyria (section 9.8.2).

Contra-indications ovarian enlargement or cyst (unless caused by polycystic ovarian disease); undiagnosed vaginal bleeding; tumours of hypothalamus and pituitary; ovarian, uterine or mammary carcinoma.

Side-effects nausea, vomiting, abdominal and pelvic pain; headache, somnolence; injection-site reactions; ovarian hyperstimulation syndrome, ovarian cyst, breast pain, ectopic pregnancy; thromboembolism, adnexal torsion, and haemoperitoneum.

Dose
By subcutaneous injection, in conjunction with follicle-stimulating hormone, according to response.

Luveris® (Merck Serono)
Injection, powder for reconstitution, lutropin alfa, net price 75-unit vial = £31.38 (with solvent).

Growth hormone
Growth hormone is used to treat deficiency of the hormone in children and in adults (see NICE guidance below). In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency; short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotropin) has been replaced by a growth hormone of human sequence, somatropin, produced using recombinant DNA technology.

NICE guidance

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency;
- have Turner syndrome;
- have Prader-Willi syndrome;
- have chronic renal insufficiency;
- are born small for gestational age with subsequent growth failure at 4 years of age or later;
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

NICE guidance
Somatropin for adults with growth hormone deficiency (August 2003).

Somatropin is recommended in adults only if the following criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method.
- Impaired quality of life, measured by means of a specific questionnaire.
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.

Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient’s physician consider it appropriate.

Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

Mecasermin, a human insulin-like growth factor-1 (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe insulin-like growth factor-I deficiency (section 6.7.4).

SOMATROPIN (Recombinant Human Growth Hormone)
Indications see under Dose.

Cautions diabetes mellitus (adjustment of antidiabetic therapy may be necessary), papilloedema (see under Side-effects), relative deficiencies of other pituitary hormones (notably hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value), history of malignant disease, disorders of the epiphysis of the hip (monitor for limping), resolved intracranial hypertension (monitor closely), initiation of treatment close to puberty not recommended in child born small for gestational age; Silver-Russell syndrome; rotate subcutaneous injection sites to prevent lipoatrophy; interactions: Appendix 1 (somatropin).

Contra-indications evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting); not to be used after renal transplantation or for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome); severe obesity or severe respiratory impairment in Prader-Willi syndrome.

Pregnancy discontinue if pregnancy occurs—no information available.

Breast-feeding no information available.

Side-effects headache, funduscropy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); fluid retention (peripheral oedema), arthralgia, myalgia, carpal tunnel syndrome, paraesthesia, antibody formation, hypothyroidism, insulin resistance, hyperglycaemia, hypo-
glycaemia, reactions at injection site; leukaemia in children with growth hormone deficiency also reported.

**Dose**

- Gonadal dysgenesis (Turner syndrome), by subcutaneous injection, 45–50 micrograms/kg daily or 1.4 mg/m² daily.
- Deficiency of growth hormone in children, by subcutaneous or intramuscular injection, 23–39 micrograms/kg daily or 0.7–1.5 mg/m² daily.
- Growth disturbance in short children born small for gestational age whose growth has not caught up by 4 years or later, by subcutaneous injection, 35 micrograms/kg daily or 1 mg/m² daily.
- Prader-Willi syndrome, by subcutaneous injection in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet, 35 micrograms/kg daily or 1 mg/m² daily; max. 2.7 mg daily.
- Chronic renal insufficiency in children (renal function decreased to less than 50%), by subcutaneous injection, 45–50 micrograms/kg daily or 1.4 mg/m² daily (higher doses may be needed) adjusted if necessary after 6 months.
- Adult growth hormone deficiency, by subcutaneous injection, initially 150–300 micrograms daily, gradually increased if required to max. 1 mg daily, use minimum effective dose (requirements may decrease with age).
- SHOX deficiency in children, by subcutaneous injection, 45–50 micrograms/kg daily.

**Note**

Dose formerly expressed in units; somatropin 1 mg = 3 units.

**Genotropin** (Pharmacia) [pms]

- Injection, two-compartment cartridge containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) cartridge = £122.87, 12-mg (36-unit) cartridge = £278.20. For use with Genotropin® Pen (Ferring) device (available free of charge from clinics). For subcutaneous injection.

**GoQuick** injection, two-compartment, multi-dose disposable, prefilled pen containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) prefilled pen = £122.87; 12-mg (36-unit) prefilled pen = £278.20. For subcutaneous injection.

**MiniQuick** injection, two-compartment single-dose syringe containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) prefilled pen = £122.87; 12-mg (36-unit) prefilled pen = £278.20. For subcutaneous injection.

**Humatrope** (Lilly) [pms]

- Injection, powder for reconstitution, somatropin (rbe), net price 6-mg (18-unit) cartridge = £108.02; 12-mg (36-unit) cartridge = £216.00; 24-mg (72-unit) cartridge = £432.00; all supplied with diluent. For subcutaneous or intramuscular injection; cartridges for subcutaneous injection.

**Norditropin** (Novo Nordisk) [pms]

- SimpleXx injection, somatropin (epir) 3.3 mg (10 units)/mL, net price 1.5-mL (5-unit) cartridge = £106.35; 6.7 mg (20 units)/mL, 1.5-mL (10-mg, 30-unit) cartridge = £212.70; 10 mg (30 units)/mL, 1.5-mL (15-mg, 45-unit) cartridge = £319.05. For use with appropriate NordiPen® device (available free of charge from clinics). For subcutaneous injection.

**Nutropin** ( Ipsen) [pms]

- Injection, somatropin (rbe), net price 10 mg (30 units) 2-ml cartridge = £203.00. For use with Nutropin® Pen device (available free of charge from clinics). For subcutaneous injection.

**Omnitrope** (Sandoz) [pms]

- Injection, somatropin (rbe) 3.3 mg (10 units)/mL, net price 1.5 mL (5-mg, 15-unit) cartridge = £86.77; 6.7 mg (20 units)/mL, 1.5 mL (10-mg, 30-unit) cartridge = £175.50. For use with Omnitrope Pen 5® and Omnitrope Pen 10® devices respectively (available free of charge from clinics). For subcutaneous injection.

**Saizen** (Merck Serono) [pms]

- Injection, powder for reconstitution, somatropin (rmc), net price 1.33-mg (4-unit) vial (with diluent) = £29.28; 3.33-mg (10-unit) vial (with diluent) = £73.20. For subcutaneous or intramuscular injection.

**Click.easy** powder, for reconstitution, somatropin (rbc), net price 8-mg (24-unit) vial (in Click.easy® device with diluent) = £185.44. For use with One.click® and Cool.Click® needle-free device (both available free of charge from clinics). For subcutaneous injection.

**Exipients** include benzyl alcohol (in 5-mg cartridge) (avoid in neonates, see Excipients, p. 2).

**Note**

Biosimilar medicine, see p. 1.

**Saizen** 3.33 mg vial may be reconstituted with sodium chloride intravenous infusion or water for injections for immediate use when administering to children under 3 years of age.

**Zomacton** (Ferring) [pms]

- Injection, powder for reconstitution, somatropin (rbe), net price 4-mg (12-unit) vial (with diluent) = £79.69, for use with ZomaJet 2nd Vision needle-free device (available free of charge from clinics) or with needles and syringes; 10 mg (30-unit) vial (with diluent) = £199.23, for use with ZomaJet Vision X needle-free device (available free of charge from clinics) or with needles and syringes. For subcutaneous injection.

**Exipients** include benzyl alcohol (in 4-mg vial) (avoid in neonates, see Excipients, p. 2).

**Growth hormone receptor antagonists**

Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist. Pegvisomant is licensed for the treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues. Pegvisomant should be initiated only by physicians experienced in the treatment of acromegaly.

**PEGVISOMANT**

**Indications** see notes above.

**Cautions**

Liver disease (monitor liver enzymes every 4–6 weeks or if symptoms of hepatitis develop); diabetes mellitus (adjustment of antidiabetic therapy may be necessary); possible increase in female fertility.
6.5.2 Posterior pituitary hormones and antagonists

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** diarrhea, constipation, nausea, vomiting, abdominal distension, dyspepsia, flatulence, elevated liver enzymes; hypertension; headache, asthenia, dizziness, drowsiness, tremor, sleep disturbances; influenza-like syndrome, weight gain, hyperglycaemia, hypoglycaemia; arthralgia, myalgia; injection-site reactions, sweating, pruritus, rash; fatigue; hypercholesterolaemia; less commonly thrombocytopenia, leucopenia, leucocytosis, bleeding tendency

**Dose**
- By subcutaneous injection, initially 80 mg, then 10 mg daily, increased in steps of 5 mg daily according to response; max. 30 mg daily; CHILD not recommended

**Somavert** (Pfizer) \( \text{HRT} \)

**Injection**, powder for reconstitution, pegvisomant, net price 10-mg vial = £50.00; 15-mg vial = £75.00; 20-mg vial = £100.00 (all with solvent)

**Thyrotrophin**

Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone). It is licensed for use with or without radioiodine imaging, together with serum thyroglobulin testing, for the detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients. It is also licensed to increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients.

**Indications** see notes above and product literature

**Cautions** presence of thyroglobulin autoantibodies may give false negative results

**Contra-indications** hypersensitivity to bovine or human thyrotrophin

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** nausea, vomiting; headache, dizziness, fatigue; less commonly asthenia, paraesthesia, back pain, influenza-like symptoms, rash, urticaria; rarely diarrhoea; very rarely palpitation, flushing, dyspnoea, pain at site of metastases, tremor, arthralgia, myalgia, hyperhidrosis, and injection-site reactions including pain, pruritus, and rash

**Dose**
- By intramuscular injection into the gluteal muscle, 900 micrograms every 24 hours for 2 doses, consult product literature

**Thyrogen** (Genzyme) \( \text{HRT} \)

**Injection**, powder for reconstitution, thyrotropin alfa 900 micrograms/vial, net price = £291.52

**Hypothalamic hormones**

Gonadorelin when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. Gonadorelin analogues are indicated in endometriosis and infertility (section 6.7.2) and in breast and prostate cancer (section 6.3.4).

**GONADORELIN** (Gonadotrophin-releasing hormone; GnRH; LH–RH)

**Indications** see preparations below

**Cautions** pituitary adenoma

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** rarely, nausea, headache, abdominal pain, increased menstrual bleeding; rarely, hypersensitivity reaction on repeated administration of large doses; irritation at injection site

**Dose**
- See under preparations

**HRF** (Intrapharm) \( \text{HRT} \)

**Injection**, powder for reconstitution, gonadorelin. Net price 100-microgram vial (with diluent) = £13.72 (hosp. only)

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients p. 2)

**Dose** for assessment of pituitary function (adults), by subcutaneous or intravenous injection, 100 micrograms

6.5.2 Posterior pituitary hormones and antagonists

**Posterior pituitary hormones**

**Diabetes insipidus** Vasopressin (antidiuretic hormone, ADH) is used in the treatment of pituitary (‘cranial’) diabetes insipidus as is its analogue desmopressin. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose of 2 micrograms intramuscularly or 20 micrograms intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides (section 2.2.1) e.g. chlorothalidone 100 mg twice daily reduced to maintenance dose of 50 mg daily.

Carbamazepine (section 4.8.1) is sometimes useful in partial pituitary diabetes insipidus (in a dose of 200 mg once or twice daily) [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

**Other uses** Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. For a comment on use of desmopressin in nocturnal enuresis see section 7.4.2.
Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin, a derivative of vasopressin, is used similarly.

Oxytocin, another posterior pituitary hormone, is indicated in obstetrics (section 7.1.1).

**DESMOPRESSIN**

**Indications** see under Dose

**Cautions** see under Vasopressin; less pressor activity, less reduction of glomerular filtration rate

**Contra-indications** cardiac insufficiency and other conditions treated with diuretics; psychogenic polydipsia and polyuria in alcohol dependence

**Renal impairment** use with caution; antidiuretic effect may be reduced

**Pregnancy** small oxytocic effect in third trimester; increased risk of pre-eclampsia

**Breast-feeding** not known to be harmful

**Side-effects** fluid retention, and hyponatraemia (in young children, and in those over 65 years); also considerable caution in cystic fibrosis; in nocturia and nocturnal enuresis limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards; in nocturia periodic blood pressure and weight checks needed to monitor for fluid overload; interactions: Appendix 1 (desmopressin)

**Hyponatraemic convulsions** Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal). The risk of hyponatraemic convulsions can also be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)

**Contra-indications** cardiac insufficiency and other conditions treated with diuretics; psychogenic polydipsia and polyuria in alcohol dependence

**Renal impairment** use with caution; antidiuretic effect may be reduced

**Pregnancy** small oxytocic effect in third trimester; increased risk of pre-eclampsia

**Breast-feeding** not known to be harmful

**Side-effects** fluid retention, and hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake; stomach pain, headache, nausea, vomiting, allergic reactions, and emotional disturbance in children also reported; epistaxis, nasal congestion, rhinitis with nasal spray

**Dose**

- By mouth (as desmopressin acetate)
  - Diabetes insipidus, treatment, ADULT and CHILD initially 300 micrograms daily (in 3 divided doses); maintenance, 300–600 micrograms daily in 3 divided doses; range 0.2–1.2 mg daily
  - Primary nocturnal enuresis, ADULT (under 65 years) and CHILD over 5 years (preferably over 7 years) 200 micrograms at bedtime, only increased to 400 micrograms if lower dose not effective (important: see also Cautions); withdraw for at least 1 week for reassessment after 3 months
  - Postoperative polyuria or polydipsia, adjust dose according to urine osmolality

- Sublingually (as desmopressin base)
  - Diabetes insipidus, treatment, ADULT and CHILD initially 180 micrograms daily in 3 divided doses; range 120–720 micrograms daily
  - Primary nocturnal enuresis, ADULT (under 65 years) and CHILD over 5 years (preferably over 7 years) 120 micrograms at bedtime, only increased to 240 micrograms if lower dose not effective (important: see also Cautions); withdraw for at least 1 week for reassessment after 3 months
  - Polyuria or polydipsia after hypophysectomy, adjust dose according to urine osmolality

- Intranasally (as desmopressin acetate)
  - Diabetes insipidus, diagnosis, ADULT and CHILD 20 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)
  - Diabetes insipidus, treatment, ADULT 10–40 micrograms daily (in 1–2 divided doses); CHILD 5–20 micrograms daily; infants may require lower doses
  - Nocturia associated with multiple sclerosis (when other treatments have failed), ADULT (under 65 years) 10–20 micrograms at bedtime (important: see also Cautions), dose not to be repeated within 24 hours
  - Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration), ADULT 40 micrograms; INFANT under 1 year 10 micrograms (restrict fluid intake to 50% at next 2 feeds to avoid fluid overload), CHILD 1–15 years 20 micrograms
  - Mild to moderate haemophilia and von Willebrand’s disease, ADULT 300 micrograms (one 150-microgram spray into each nostril) 30 minutes before surgery or when bleeding; may be repeated at intervals of 12 hours (or at intervals of at least 3 days if self-administered)
  - Fibrinolytic response testing, ADULT 300 micrograms (one 150-microgram spray into each nostril); blood sampled after 1 hour for fibrinolytic activity

- By injection (as desmopressin acetate)
  - Diabetes insipidus, diagnosis (subcutaneous or intramuscular), ADULT and CHILD 2 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)
  - Fibrinolytic response testing, (as desmopressin acetate)
  - Mild to moderate haemophilia and von Willebrand’s disease, (subcutaneous or intravenous), ADULT 1–4 micrograms daily; INFANT and CHILD 400 nanograms
  - Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration) (subcutaneous or intramuscular), ADULT and CHILD 2 micrograms; INFANT 400 nanograms (restrict fluid intake to 50% at next 2 feeds)
  - Mild to moderate haemophilia and von Willebrand’s disease, (subcutaneous or intravenous), ADULT and CHILD over 1 month 300 nanograms/kg as a single dose immediately before surgery or after trauma; may be repeated at intervals of 12 hours
  - Fibrinolytic response testing, (subcutaneous or intravenous), ADULT and CHILD 300 nanograms/kg; blood sampled after 20 minutes for fibrinolytic activity

**Lumbar-puncture-associated headache**

**Diabetes insipidus, diagnosis**

- **Diabetes insipidus, treatment**
  - Infants may require lower doses
  - Mild to moderate haemophilia and von Willebrand’s disease
  - Mild to moderate haemophilia and von Willebrand’s disease

**Brands include**

- Presven (Ferring)
- Presven (Schering-Plough)
- DDAVP® (Ferring)

**Fibrinolytic response testing**

**Diabetes insipidus, diagnosis**

- **Diabetes insipidus, treatment**
  - Infants may require lower doses
  - Mild to moderate haemophilia and von Willebrand’s disease
  - Mild to moderate haemophilia and von Willebrand’s disease

**Brands include**

- Presven (Ferring)
- Presven (Schering-Plough)
- DDAVP® (Ferring)
£50.53; 120 micrograms, 100-tab pack = £101.07; 240 micrograms, 100-tab pack = £202.14. Label: 26, counselling, fluid intake, see above

**Intranasal solution**, desmopressin acetate 100 micrograms/mL. Net price 2.5-mL dropper bottle and catheter = £9.72. Counselling, fluid intake, see above

**Injection**, desmopressin acetate 4 micrograms/mL. Net price 1-mL amp = £1.10

**Desmobil®** (Ferring) ▼
Tablets, scored, desmopressin acetate 200 micrograms, net price 30-tab pack = £29.43. Counselling, fluid intake, see above

**DesmoMelt®** (Ferring) ▼
Oral lyophilisates, desmopressin (as acetate) 120 micrograms, net price 30-tab pack = £30.34; 240 micrograms, 30-tab pack = £60.68. Label: 26, counselling, fluid intake, see above

**Desmospray®** (Ferring) ▼
Nasal spray, desmopressin acetate 10 micrograms/metered spray. Net price 6-mL unit (60 metered sprays) = £25.02. Counselling, fluid intake, see above

Note Children requiring dose of less than 10 micrograms should be given DDAVP® intranasal solution

**Octim®** (Ferring) ▼
Nasal spray, desmopressin acetate 150 micrograms/metered spray, net price 2.5-mL unit (25 metered sprays) = £576.60. Counselling, fluid intake, see above

**Injection**, desmopressin acetate 15 micrograms/mL, net price 1-mL amp = £19.22

**VASOPRESSIN**

**Indications** pituitary diabetes insipidus; bleeding from oesophageal varices

**Cautions** heart failure, hypertension, asthma, epilepsy, migraine or other conditions which might be aggravated by water retention; avoid fluid overload

**Contra-indications** vascular disease (especially disease of coronary arteries) unless extreme caution, chronic nephritis (until reasonable blood nitrogen concentrations attained)

**Renal impairment** see Contra-indications

**Pregnancy** oxytocic effect in third trimester

**Breast-feeding** not known to be harmful

**Side-effects** fluid retention, pallor, tremor, sweating, vertigo, headache, nausea, vomiting, belching, abdominal cramps, desire to defaecate, hypersensitivity reactions (including anaphylaxis), constriction of coronary arteries (may cause anginal attacks and myocardial ischaemia), peripheral ischaemia and rarely gangrene

**Dose**
- By subcutaneous or intramuscular injection, diabetes insipidus, 5–20 units every four hours
- By intravenous infusion, initial control of variceal bleeding, 20 units over 15 minutes

**Synthetic vasopressin**

**Pitressin®** (Goldshield) ▼
Injection, argipressin (synthetic vasopressin) 20 units/mL. Net price 1-mL amp = £17.14 (hosp. only)

**Antidiuretic hormone antagonists**

**Demeclocycline** (section 5.1.3) can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline is thought to act by directly blocking the renal tubular effect of antidiuretic hormone. Initially 0.9–1.2 g is given daily in divided doses, reduced to 600–900 mg daily for maintenance.

**Tolvaptan**

Tolvaptan is a vasopressin V2-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

**Side-effects** nausea, constipation, dry mouth; postural hypotension; thirst, decreased appetite, fever, asthenia, hyperglycaemia, urinary frequency,
Osteoporosis

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements (section 9.5.1.1 and section 9.6.4). Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

Postmenopausal osteoporosis The bisphosphonates (alendronic acid, disodium etidronate, and risedronate, section 6.6.2) are effective for preventing postmenopausal osteoporosis. Hormone replacement therapy (HRT section 6.4.1.1) is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should not be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Calcitonin (section 6.6.1) may be considered for those at high risk of osteoporosis for whom a bisphosphonate is unsuitable. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be treated with a bisphosphonate (section 6.6.2). The bisphosphonates (such as alendronate, etidronate, and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable calcitriol (section 9.6.4), calcitonin or strontium ranelate (section 6.6.2) may be considered. Calcitonin [unlicensed indication] may also be useful for pain relief for up to 3 months after a vertebral fracture if other analgesics are ineffective. Parathyroid hormone, and teriparatide (section 6.6.1) have been introduced for the treatment of postmenopausal osteoporosis.

Raloxifene (section 6.4.1.1) is licensed for the prophylaxis and treatment of vertebral fractures in postmenopausal women.

NICE guidance

Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)

Alendronate is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:

- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m², ankylosing spondylitis, Crohn’s disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) and confirmed osteoporosis
- Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis
- Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis

Risedronate or etidronate are recommended as alternatives for women:

- in whom alendronate is contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance

Strontium ranelate is recommended as an alternative for women:

- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance

Raloxifene is not recommended as a treatment option in postmenopausal women for primary prevention of osteoporotic fractures.

1. Available at www.nice.org.uk/TA160
Corticosteroid-induced osteoporosis. To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis (section 3.2). Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking oral corticosteroids who have sustained a low-trauma fracture should receive treatment for osteoporosis. The therapeutic options for prophylaxis and treatment of corticosteroid-induced osteoporosis are the same:
- A bisphosphonate (section 6.6.2);
- Calcitriol [unlicensed indication] (section 9.6.4);
- Hormone replacement (HRT in women (section 6.4.1), testosterone in men [unlicensed indication] (section 6.4.2)).

### 6.6.1 Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homoeostasis. Calcitonin (salmon) (salcatonin, synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in some patients with hypercalcaemia (notably when associated with malignant disease). Calcitonin is licensed for treatment of Paget’s disease of bone. It can also be used in the prevention and treatment of postmenopausal osteoporosis (see section 6.6).

Recombinant parathyroid hormone is used for the treatment of postmenopausal osteoporosis. Teriparatide (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis. The Scottish Medicines Consortium, p. 4 has advised (February 2007) that parathyroid hormone (Preotact®) should be initiated by specialists experienced in the treatment of osteoporosis; also that the use of teriparatide (Forstero®) (December 2003) in postmenopausal women should be restricted to the treatment of established (severe) osteoporosis and should be initiated by specialists experienced in the treatment of osteoporosis.

Cinacalcet (section 9.5.1.2) is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

### NICE guidance

**Alendronate, etidronate, risendronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)**

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

**Alendronate** is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenopausal women.

**Risedronate** or **etidronate** are recommended as alternatives for women:

- in whom alendronate is contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance).

**Strontium ranelate** or **raloxifene** are recommended as alternatives for women:

- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

**Teriparatide** is recommended as an alternative for women:

- in whom alendronate and either risedronate or etidronate, or strontium ranelate are contra-indicated or not tolerated, or where treatment with alendronate, risedronate or etidronate has been unsatisfactory (indicated by another fragility fracture and a decline in bone mineral density despite treatment for 1 year) and
- who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance.

---

1. Available at [www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)
BNF 61

6.6.2 Bisphosphonates and other drugs affecting bone metabolism

**Dose**
- Hypercalcaemia of malignancy (see also section 9.5.1.2). ADULT over 18 years, by subcutaneous or intramuscular injection, 100 units every 6–8 hours adjusted according to response; max. 400 units every 6–8 hours; in severe or emergency cases, by intravenous infusion, up to 10 units/kg over at least 6 hours
- Paget’s disease of bone, ADULT over 18 years, by subcutaneous or intramuscular injection, 50 units 3 times weekly to 100 units daily adjusted according to response
- Postmenopausal osteoporosis to reduce risk of vertebral fractures, intranasally, 200 units (1 spray) into one nostril daily, with dietary calcium and vitamin D supplements (section 9.5.1.1 and section 9.6.4)
- Prevention of acute bone loss due to sudden immobility, ADULT over 18 years, by subcutaneous or intramuscular injection, 100 units daily in 1–2 divided doses for 2–4 weeks, reduced to 50 units daily at start of mobilisation and continued until fully mobile

**Side-effects**
- Gastro-intestinal disorders (including nausea, vomiting, dyspepsia, constipation, diarrhoea; palpitation; headache, dizziness, fatigue, asthenia; transient hypercalcaemia, hypercalciuria; muscle cramp, pain in extremities, back pain; injection-site reactions; less commonly abdominal pain, altered sense of smell, taste disturbance, anorexia, influenza, hyperuricaemia
- By subcutaneous injection, 100 micrograms daily, max. duration of treatment 24 months

**Preotact®** (Nycomed) **Injection**, dual-chamber cartridge containing powder for reconstitution, parathyroid hormone (rdna) and diluent, net price 1.61-mg (14-dose) cartridge = £156.24. For use with Preotact® pen device.

**TERIPARATIDE**

**Indications**
- Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures; treatment of corticosteroid-induced osteoporosis; see also notes above

**Contra-indications**
- Pre-existing hypercalcaemia, skeletal malignancies or bone metastases, metabolic bone diseases, including Paget’s disease and hyperparathyroidism, unexplained raised alkaline phosphatase, previous radiation therapy to the skeleton

**Renal impairment**
- Caution in moderate impairment; avoid if severe

**Pregnancy**
- Avoid

**Breast-feeding**
- Avoid

**Side-effects**
- Gastro-intestinal disorders (including nausea, reflux and haemorrhoids); palpitation; dyspnoea; headache, fatigue, asthenia, depression, dizziness, vertigo; anaemia, increased sweating, muscle cramps, sciatica, myalgia, arthralgia; less commonly urinary disorders, hypercalcaemia; injection-site reactions; rarely hypersensitivity reactions

**Dose**
- By subcutaneous injection, 20 micrograms daily, max. duration of treatment 18 months (course not to be repeated)

**Forsteo®** (Lilly) **Injection**, teriparatide 250 micrograms/mL, net price 2.4-mL prefilled pen = £271.88, 3-mL prefilled pen = £271.88

**Note**
- 3-mL prefilled pen intended for 28 doses

**PARATHYROID HORMONE**

(Human recombinant parathyroid hormone)

**Indications**
- Treatment of osteoporosis in postmenopausal women at high risk of fractures (to reduce the risk of vertebral fractures) (see also notes above)

**Cautions**
- Monitor serum or urinary calcium concentration at 1, 3 and 6 months after initiation of treatment (consult product literature for guidance if serum-calcium concentration raised); active or previous urolithiasis; concomitant cardiac glycosides

**Contra-indications**
- Previous radiation therapy to skeleton, pre-existing hypercalcaemia, metabolic bone disease (including hyperparathyroidism and Paget’s disease), unexplained raised levels of alkaline phosphatase

**Hepatic impairment**
- Avoid

**Renal impairment**
- Avoid if eGFR less than 30 mL/minute/1.73m²

**Pregnancy**
- Avoid

**Breast-feeding**
- Avoid

**Side-effects**
- Nausea, vomiting, dyspepsia, constipation, diarrhoea; palpitation; headache, dizziness, fatigue, asthenia; transient hypercalcaemia, hypercalciuria; muscle cramp, pain in extremities, back pain; injection-site reactions; less commonly abdominal pain, altered sense of smell, taste disturbance, anorexia, influenza, hyperuricaemia

**Dose**
- By subcutaneous injection, 100 micrograms daily, max. duration of treatment 24 months

**Bisphosphonates**

Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover. Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; alendronic acid or risedronate sodium are considered the drugs of choice for these conditions, but disodium etidronate may be considered if these drugs are unsuitable or not tolerated (see also section 6.8).

Bisphosphonates are also used in the treatment of Paget’s disease, hypercalcaemia of malignancy (section 9.5.1.2), and in bone metastases in breast cancer (section 8.3.4.1). Disodium etidronate can impair bone mobilisation and continued until fully mobile.
mineralisation when used continuously or in high doses (such as in the treatment of Paget’s disease).

MHRA/CHM advice

**Bisphosphonates: osteonecrosis of the jaw**

(October 2007 and November 2009)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease. All patients receiving bisphosphonates for cancer should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment. However, urgent bisphosphonate treatment should not be delayed, and a dental check-up should be carried out as soon as possible in these patients. All other patients who are prescribed bisphosphonates should have a dental examination only if they have poor dental health.

During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

**ALENDRONIC ACID**

**Indications** see under Dose

**Cautions** upper gastro-intestinal disorders (dysphagia, symptomatic oesophageal disease, gastritis, duodenitis, or ulcers—see also under Contra-indications and Side-effects); history (within 1 year) of ulcers, active gastro-intestinal bleeding, or surgery of the upper gastro-intestinal tract; correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting and monitor serum-calcium concentration during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, above); exclude other causes of osteoporosis; atypical stress fractures reported (discontinue unless benefits of continued treatment clearly outweigh risks); inter-actions: Appendix 1 (bisphosphonates)

**Contra-indications** abnormalities of oesophagus and other factors which delay emptying (e.g. stricture or oesophageal motility disorders); hypocalcaemia

**Renal impairment** avoid if eGFR less than 35 mL/minute/1.73 m²

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** oesophageal reactions (see below), abdominal pain and distension, dyspepsia, regurgitation, nausea, diarrhoea or constipation, flatulence, musculoskeletal pain, headache; rarely rash, pruritus, erythema, photosensitivity, urticaria, scleritis, transient decrease in serum calcium and phosphate; vomiting, gastritis, peptic ulceration, hypersensitivity reactions (including urticaria and angioedema), and atypical stress fractures with long-term use also reported; myalgia, malaise, and fever at initiation of treatment; very rarely severe skin reactions (including Stevens-Johnson syndrome), osteonecrosis of the jaw (see MHRA/CHM advice, above)

**Oesophageal reactions** Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported, patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain

**Dose**

- Treatment of postmenopausal osteoporosis, 10 mg daily or 70 mg once weekly
- Treatment of osteoporosis in men, 10 mg daily
- Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy, 10 mg daily

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing, to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet

**Alendronic acid (Non-proprietary)**

Tablets, alendronic acid (as sodium alendronate) 10 mg, net price 28-tab pack = £1.65. Counselling, administration

**Fosamax® (MSD)**

Tablets, alendronic acid (as sodium alendronate) 10 mg, 28-tab pack = £23.12. Counselling, administration

**Alendronic Acid Once-Weekly (Non-proprietary)**

Tablets, alendronic acid (as sodium alendronate) 70 mg, net price 4-tab pack = £1.05. Counselling, administration

**Fosamax® Once Weekly** (MSD)

Tablets, alendronic acid (as sodium alendronate) 70 mg, net price 4-tab pack = £22.80. Counselling, administration

With colecaciferol

For prescribing information on colecaciferol, see section 9.6.4

**Fosavance® (MSD)**

Tablets, alendronic acid (as sodium alendronate) 70 mg, colecaciferol 70 micrograms (2 800 units), net price 4-tab pack = £22.80. Counselling, administration

**Dose** treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency, 1 tablet once weekly

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet

**DISODIUM ETIDRONATE**

**Indications** see under Dose

**Cautions** consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, above); inter-actions: Appendix 1 (bisphosphonates)

**Contra-indications** not indicated for osteoporosis in presence of hypercalcaemia or hypercalciuria or for osteomalacia

**Renal impairment** reduce dose in mild impairment; avoid in moderate to severe renal impairment
BNF 61 6.6.2 Bisphosphonates and other drugs affecting bone metabolism 473

Pregnancy avoid
Breast-feeding no information available

Side-effects nausea, diarrhoea or constipation, abdominal pain; increased bone pain in Paget’s disease, also increased risk of fractures with high doses in Paget’s disease (discontinue if fractures occur); rarely exacerbation of asthma, skin reactions (including angioedema, rash, urticaria and pruritus), transient hyperphosphataemia, headache, paraesthesia, peripheral neuropathy reported; blood disorders (including leucopenia, agranulocytosis and pancreatic) also reported; very rarely osteonecrosis of the jaw (see MHRA/CHM advice, p. 472)

Dose

- Paget’s disease of bone, by mouth, 5 mg/kg as a single daily dose for up to 6 months; doses above 10 mg/kg daily for up to 3 months may be used with caution but doses above 20 mg/kg daily are not recommended; after interval of not less than 3 months may be repeated where evidence of reactivation—including biochemical indices (avoid premature retreatment)

- Osteoporosis, see under Didronel PMO®

Counselling Avoid food for at least 2 hours before and after oral treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids

Didronel® (Warner Chilcott) Tablets, disodium etidronate 200 mg. Net price 60-tab pack = £19.48. Counselling, food and calcium (see above)

- With calcium carbonate
  For prescribing information on calcium carbonate see section 9.5.1.1

Didronel PMO® (Warner Chilcott) Tablets, 14 white, disodium etidronate 400 mg: 76 pink, effervescent, calcium carbonate 1.25 g (Cacit®). Net price per pack = £19.89. Label: 10, patient information leaflet, counselling, food and calcium (see above)

Dose treatment of osteoporosis, prevention of bone loss in postmenopausal women (particularly if hormone replacement therapy inappropriate), and prevention and treatment of corticosteroid-induced osteoporosis, given in 90-day cycles. 1 Didronel® tablet daily for 14 days, then 1 Cacit® tablet daily for 76 days

Hepatic impairment caution in severe hepatic impairment—no information available
Renal impairment max. infusion rate 20 mg/hour; avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value
Pregnancy avoid
Breast-feeding avoid

Side-effects hypophosphataemia, fever and influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes); nausea, vomiting, anorexia, abdominal pain, diarrhoea, constipation; symptomatic hypercalcaemia (paraesthesia, tetany), hypomagnesaemia, headache, insomnia, drowsiness; hypertension; anaemia, thrombocytopenia, lymphocytopenia; rash; arthralgia, myalgia, bone pain; rarely muscle cramps, dyspepsia, agitation, confusion, dizziness, lethargy; leucopenia, hypotension, pruritus, hyperkalaemia or hypokalaemia, and hyperparathyroidism; osteonecrosis of the jaw (see also MHRA/CHM advice, p. 472), isolated cases of seizures, hallucinations, haematuria, acute renal failure, deterioration of renal disease, conjunctivitis and other ocular symptoms; atrial fibrillation, and reactivation of herpes simplex and zoster also reported; also injection-site reactions

Dose

- By slow intravenous infusion (via cannula in a relatively large vein), see also Appendix 6

Hypercalcaemia of malignancy, according to serum calcium concentration 15–60 mg in single infusion or in divided doses over 2–4 days; max. 90 mg per treatment course

Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma, 90 mg every 4 weeks (or every 3 weeks to coincide with chemotherapy in breast cancer)

Paget’s disease of bone, 30 mg once a week for 6 weeks (total dose 180 mg) or 30 mg in first week then 60 mg every other week (total dose 210 mg); max. total 360 mg (in divided doses of 60 mg) per treatment course; may be repeated every 6 months

- CHL0 not recommended
Calcium and vitamin D supplements Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget’s disease

Disodium pamidronate (Non-proprietary) Concentrate for intravenous infusion, disodium pamidronate 3 mg/mL, net price 5-mL vial = £27.50, 10-mL vial = £55.00; 6 mg/mL, 10-mL vial = £95.00; 9 mg/mL, 10-mL vial = £165.00; 15 mg/mL, 1-mL vial = £29.83, 2-mL vial = £59.66, 4-mL vial = £119.32, 6-mL vial = £170.46
Aredia Dry Powder® (Novartis) Injection, powder for reconstitution, disodium pamidronate, for use as an infusion. Net price 15-mg vial = £29.83; 30-mg vial = £59.66; 90-mg vial = £170.45 (all with diluents)

DISODIUM PAMIDRONATE
Disodium pamidronate was formerly called aminohydroxypropylidendiphosphonate disodium (APD)

Indications see under Dose

Cautions assess renal function before each dose; ensure adequate hydration; cardiac disease (especially in elderly); previous thyroid surgery (risk of hypercalcaemia); monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes; avoid concurrent use with other bisphosphonates; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); interactions: Appendix 1 (bisphosphonates)

Driving Patients should be warned against driving or operating machinery immediately after treatment (somnolence or dizziness can occur)
IBANDRONIC ACID

**Indications**  see under Dose

**Cautions**  consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); monitor renal function and serum calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); interactions: Appendix 1 (bisphosphonates)

**Contra-indications**  hypocalcaemia; oral route abnormalities of the oesophagus and other factors which delay emptying (e.g. stricture or achalasia)

**Renal impairment**  for treatment of osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m²; for reduction of bone damage in bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce intravenous dose to 4 mg and infuse over 1 hour, reduce oral dose to 50 mg on alternative days, if eGFR less than 30 mL/minute/1.73 m² reduce intravenous dose to 2 mg and infuse over 1 hour, reduce oral dose to 50 mg once weekly

**Pregnancy**  avoid

**Breast-feeding**  avoid—present in milk in animal studies

**Side-effects**  hypocalcaemia, oral route abnormalities of the oesophagus and other factors which delay emptying (e.g. stricture or achalasia), diarrhea, nausea, vomiting, gastritis, abdominal pain, dyspepsia, pharyngitis; headache, asthenia, rash; rarely anaemia, hypersensitivity reactions (pruritus, bronchospasm and angioedema reported); urticaria; injection-site reactions; very rarely osteonecrosis of the jaw (see MHRA/CHM advice, p. 472); oesophageal reactions Severe oesophageal reactions (pruritus, bronchospasam and angioedema reported); urticaria; injection-site reactions; very rarely osteonecrosis of the jaw (see MHRA/CHM advice, p. 472); oesophageal reactions Patients should be advised to stop tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

**Dose**

- Reduction of bone damage in bone metastases in breast cancer, **by mouth**, 50 mg daily, or **by intravenous infusion**, 6 mg every 3–4 weeks
- Hypercalcaemia of malignancy **by intravenous infusion**, according to serum calcium concentration, 2–4 mg in single infusion
- Treatment of postmenopausal osteoporosis, **by mouth**, 150 mg once a month or **by intravenous injection** over 15–30 seconds, 3 mg every 3 months
- **CHILD** not recommended

**Counselling**  Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach 30 minutes (IBandron® tablets, 50 mg) or 1 hour (Bonviva® tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet

**Bondronat** (Roche)  Tablets, f/c, ibandronic acid 50 mg, net price 28-tab pack = £183.69. Counselling, administration

**Concentrate for intravenous infusion**, ibandronic acid 1 mg/mL, net price 2-mL amp = £89.36, 6-mL vial = £183.69

**Bonviva** (Roche)  Tablets, f/c, ibandronic acid 150 mg, net price 1-tab pack = £18.40, 3-tab pack = £55.21. Counselling, administration

**Injection**, ibandronic acid 1 mg/mL, net price 3-mL prefilled syringe = £68.64

RISEDRONATE SODIUM

**Indications**  see under Dose

**Cautions**  oesophageal abnormalities and other factors which delay transit or emptying (e.g. stricture or achalasia)—see also under Side-effects); correct hypocalcaemia before starting, correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); interactions: Appendix 1 (bisphosphonates)

**Contra-indications**  hypocalcaemia (see Cautions above)

**Renal impairment**  avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**  avoid

**Breast-feeding**  avoid

**Side-effects**  abdominal pain, dyspepsia, nausea, diarrhea, constipation, headache, musculoskeletal pain; less commonly oesophagitis, oesophageal ulcer, dysphagia, gastritis, duodenitis, uveitis; rarely glossitis, oesophageal stricture; also reported gastro-duodenal ulceration, hepatic disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis, hair loss; osteonecrosis of the jaw (see MHRA/CHM advice, p. 472)

**Oesophageal reactions**  Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

**Dose**

- Paget’s disease of bone, 30 mg daily for 2 months; may be repeated if necessary after at least 2 months
- Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, 5 mg daily or 35 mg once weekly
- Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women, 5 mg daily
- Treatment of osteoporosis in men at high risk of fractures, 35 mg once weekly
- **CHILD** see BNF for Children

**Counselling**  Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk, also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising

**Actonel®** (Warner Chilcott)  Tablets, f/c, risedronate sodium 5 mg (yellow), net price 28-tab pack = £17.99; 30 mg (white), 28-tab pack = £143.95. Counselling, administration, food and calcium (see above)

**Actonel Once a Week®** (Warner Chilcott)  Tablets, f/c, orange, risedronate sodium 35 mg, net price 4-tab pack = £19.12. Counselling, administration, food and calcium (see above)

**With calcium carbonate and coecalciferol**

For cautions, contra-indications, and side-effects of calcium carbonate, see section 9.5.1.1 and of coecalciferol, see section 9.6.4

**Actonel® Combi** (Warner Chilcott)  Tablets, f/c, orange, risedronate sodium 35 mg (Actonel Once a Week®):
**SODIUM CLODRONATE**

**Indications** see under Dose

**Cautions** monitor renal and hepatic function and white cell count; also monitor serum calcium and phosphate periodically; renal dysfunction reported in patients receiving concomitant NSAIDs; maintain adequate fluid intake during treatment; consider dental check-up before initiating bisphosphate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); interactions: Appendix 1 (bisphosphonates)

**Contra-indications** acute gastro-intestinal inflammatory conditions

**Renal impairment** use half normal dose if eGFR 10–20 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** nausea, diarrhoea; skin reactions; bronchospasm; very rarely osteonecrosis of the jaw (see MHRA/CHM advice, p. 472);

**Dose**
- Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma, by mouth, 1.6 g daily in single or 2 divided doses increased if necessary to a max. of 3.2 g daily
- Osteonecrosis of the jaw

**Counselling**
- Avoid food for 1 hour before and after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake
- Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately

**Bonefos®** (Bayer Schering)
- **Capsules**, yellow, sodium clodronate 400 mg, net price 120-cap pack = £139.83. Counselling, food and calcium
- **Tablets**, f/c, scored, sodium clodronate 800 mg, net price 60-tab pack = £146.43. Counselling, food and calcium

**Clasteon®** (Beacon)
- **Capsules**, blue/white, sodium clodronate 400 mg, net price 30-cap pack = £34.96, 120-cap pack = £139.83. Counselling, food and calcium

**Loron 520®** (Roche)
- **Tablets**, f/c, scored, sodium clodronate 520 mg, net price 60-tab pack = £152.59. Label: 10, patient information leaflet, counselling, food and calcium
- **Dose** 2 tablets daily in single or two divided doses. may be increased to max. 4 tablets daily

**TILDURONIC ACID**

**Indications** Paget's disease of bone

**Cautions** correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting; avoid concomitant use of indomethacin, consider dental check-up before initiating bisphosphate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); interactions: Appendix 1 (bisphosphonates)

**Contra-indications** juvenile Paget's disease

**Renal impairment** use with caution and monitor renal function regularly if eGFR 30–90 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** avoid

**Breast-feeding** avoid—no information available

**Side-effects** stomach pain, nausea, diarrhoea; very rarely asthenia, dizziness, headache and skin reactions; very rarely osteonecrosis of the jaw (see MHRA/CHM advice, p. 472)

**Dose**
- 400 mg daily as a single dose for 12 weeks; may be repeated if necessary after 6 months
- **Counselling** Avoid food for 2 hours before and after treatment, particularly calcium-containing products e.g. milk; also avoid antacids

**Skeld®** (Sanofi-Aventis)
- **Tablets**, tiludronic acid (as tiludronate disodium) 200 mg. Net price 28-tab pack = £95.14. Counselling, food and calcium

**ZOLEDRONIC ACID**

**Indications** see under preparations

**Cautions** correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting; monitor serum electrolytes, calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); consider dental check-up before initiating bisphosphate (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 472); interactions: Appendix 1 (bisphosphonates)

**Renal function** Renal impairment and renal failure have been reported. Before each dose ensure patient is hydrated and assess renal function. Continue to monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated. Use with caution with concomitant medicines that affect renal function

**Contra-indications** women of child-bearing potential

**Hepatic impairment** caution in severe hepatic impairment—limited information available

**Renal impairment** avoid if serum creatinine above 400 micromol/litre in tumour-induced hypercalcaemia; in advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks, if eGFR 40–50 mL/minute/1.73 m² reduce dose to 3.3 mg every 3–4 weeks, if eGFR 30–40 mL/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks, if eGFR less than 30 mL/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre); if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value; avoid in Paget’s disease, treatment of postmenopausal osteoporosis and osteoporosis in men if
Denosumab

Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption. It is licensed for the treatment of postmenopausal osteoporosis in women at increased risk of fractures and for the treatment of bone loss associated with hormone ablation in men with prostate cancer.

NICE guidance

Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010)

Denosumab is recommended as a treatment option for the primary prevention of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:

- who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance (available at www.nice.org.uk/TA204).

Denosumab is recommended as a treatment option for the secondary prevention of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments.

DENOSUMAB

Indications see notes above

Cautions correct hypocalcaemia and vitamin D deficiency before starting (monitor plasma-calcium concentration during therapy); consider dental check-up and carry out invasive procedures before initiating treatment (risk of osteonecrosis of the jaw)

Renal impairment increased risk of hypocalcaemia if eGFR less than 30 mL/minute/1.73 m²—monitor plasma-calcium concentration

Pregnancy avoid

Breast-feeding avoid

Side-effects constipation, urinary tract infection, upper respiratory tract infection; pain in extremity, sciatia; cataracts, rash; less commonly diverticulitis, cellulitis (seek prompt medical attention), ear infection, eczema; rarely osteonecrosis of the jaw; very rarely uveitis

Dose

- By subcutaneous injection, 60 mg every 6 months

Note Supplement with calcium and vitamin D

Prolia® (Amgen) ▼ (BNF)

Injection, denosumab 60 mg/mL, net price 1-mL prefilled syringe = £183.00

Strontium ranelate

Strontium ranelate stimulates bone formation and reduces bone resorption. It is licensed for the treatment of postmenopausal osteoporosis. The Scottish Medicines Consortium (p. 4) has advised (July 2005) that treatment with strontium ranelate should be restricted to those patients in whom bisphosphonates are contraindicated or not tolerated, and then only in women aged over 75 years with a previous fracture and low bone mineral density or in other women at equivalent risk.
similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and vice versa).

Quinagolide is a non-ergot dopamine D1 agonist; it has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

Cautions see notes below, also bromocriptine and cabergoline should be used with caution in patients with a history of peptic ulcer, particularly in acromegalic patients. Treatment should be withdrawn if gastro-intestinal bleeding occurs. In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment). Bromocriptine and cabergoline should be used with caution in patients with Raynaud's syndrome and cardiovascular disease (see also Contra-indications under Bromocriptine, below). Monitor for fibrotic disease (see Fibrotic Reactions, below). Caution is also advised in patients with a history of serious mental disorders (especially psychotic disorders) and in those with acute porphyria (see section 9.8.2). Tolerance may be reduced by alcohol.

Contra-indications Bromocriptine and cabergoline should not be used in patients with hypersensitivity to ergot alkaloids. They are contra-indicated in those with cardiac valvulopathy (exclude before treatment, see Fibrotic Reactions, below). They should also be avoided in pre-eclampsia (see also Contra-indications under Bromocriptine, below).

Side-effects Nausea, constipation, and headache are common side-effects of bromocriptine and cabergoline. Parasthesia has been reported rarely. Other reported side-effects include hypotension (see also Hypotensive Reactions, below), dyskinesia, pathological gambling, increased libido, hypersexuality, leg cramps, allergic skin reactions, alopecia, and peripheral oedema. Bromocriptine and cabergoline have been associated with pleuritis, pleural effusion, cardiac valvulopathy, pericardial effusion, constrictive pericarditis, and retroperitoneal, pleural, and pulmonary fibrosis (see Fibrotic Reactions).

Fibrotic reactions Ergot-derived dopamine-receptor agonists, bromocriptine, cabergoline, lisuride [discontinued], and pergolide have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for chronic endocrine disorders (excludes suppression of lactation) or Parkinson's disease; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis, by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).
**Driving**

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopaminergic drugs.

Patients starting treatment with these drugs should be warned of the possibility of these effects and of the need to exercise caution when driving or operating machinery.

Patients who have suffered excessive sedation or sudden onset of sleep should refrain from driving or operating machines until those effects have stopped recurring.

**Hypotensive reactions** Hypotensive reactions can be disturbing in some patients during the first few days of treatment with bromocriptine, cabergoline, or quinagolide—monitor blood pressure for a few days after starting treatment and following dosage increases; particular care should be exercised when driving or operating machinery.

**Suppression of lactation** Although bromocriptine and cabergoline are licensed to suppress lactation, they are not recommended for routine suppression (or for the relief of symptoms of postpartum pain and engagement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

**BROMOCRIPTINE**

**Indications** see notes above and under Dose; Parkinson’s disease (section 4.9.1)

**Cautions** see notes above; also specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroadenoma; contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration); **interactions:** Appendix 1 (bromocriptine)

**Contra-indications** see notes above; also hypertension in postpartum women or in puerperium (see also below)

**Postpartum or puerperium** Should not be used postpartum or in puerperum in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unremitting headache, or signs of CNS toxicity develop

**Hepatic impairment** dose reduction may be necessary

**Pregnancy** see Cautions above

**Breast-feeding** suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails

**Side-effects** see notes above; also drowsiness (see also Driving, above), nasal congestion; less commonly vomiting, postural hypotension, fatigue, dizziness, dry mouth; also, particularly with high doses, confusion, psychomotor excitation, hallucinations; rarely diarrhoea, gastro-intestinal bleeding, gastric ulcer, abdominal pain, tachycardia, bradycardia, arrhythmia, insomnia, psychosis, visual disturbances, tinnitus; very rarely vasospasm of fingers and toes particularly in patients with Raynaud’s syndrome, and effects like neuroleptic malignant syndrome on withdrawal; urinary incontinence, leucopenia, thrombocytopoenia, hyponatraemia, reversible hearing loss, increased libido, and hypersexuality also reported

**Dose**

- Prevention or suppression of lactation (but see notes above and under Cautions), 2.5 mg on day 1 (prevention) or daily for 2–3 days (suppression); then 2.5 mg twice daily for 14 days
- Hypogonadism, galactorrhoea, infertility, initially 1–1.25 mg at bedtime, increased gradually; usual dose 7.5 mg daily in divided doses, increased if necessary to max. 30 mg daily, usual dose in infertility without hyperprolactinaemia, 2.5 mg twice daily
- Acromegaly, initially 1–1.25 mg at bedtime; increased gradually to 5 mg every 6 hours
- Prolactinoma, initially 1–1.25 mg at bedtime; increased gradually to 5 mg every 6 hours (occasional patients may require up to 30 mg daily)
- CHILD under 15 years, not recommended

**Bromocriptine (Non-proprietary)**

- **Tablets**, bromocriptine (as mesilate) 2.5 mg, net price 30-tab pack = £22.92. Label: 10, 21, counselling, driving, see notes above
- **Parlodel** (Meda)

- **Tablets**, both scored, bromocriptine (as mesilate) 1 mg, net price 100-tab pack = £9.90; 2.5 mg, 30-tab pack = £5.78. Label: 10, 21, counselling, driving; see notes above

- **Capsules**, bromocriptine (as mesilate) 5 mg (blue/white), net price 100-cap pack = £37.57; 10 mg (white), 100-cap pack = £69.50. Label: 10, 21, counselling, driving, see notes above

**CABERGOLINE**

**Indications** see notes above and under Dose

**Cautions** see notes above; also monthly pregnancy tests during the amenorrhoeic period; advise non-hormonal contraception if pregnancy not desired (see also Pregnancy, below); **interactions:** Appendix 1 (cabergoline)

**Contra-indications** see notes above; history of puerperal psychosis; history of pulmonary, pericardial, or retroperitoneal fibrotic disorders (see Fibrotic Reactions in notes above); cardiac valvulopathy

**Hepatic impairment** reduce dose in severe hepatic impairment

**Pregnancy** no evidence of harm; exclude pregnancy before starting and discontinue 1 month before intended conception (ovulatory cycles persist for 6 months)—discontinue if pregnancy occurs during treatment (specialist advice needed)

**Breast-feeding** suppresses lactation; avoid breast-feeding if lactation prevention fails

**Side-effects** see notes above; also cardiac valvulopathy, drowsiness (see also Driving, above), dyspepsia, gastritis, epigastric and abdominal pain, angina, syncope, depression, confusion, hallucinations, breast pain; rarely vomiting, palpitation, epistaxis, digital vasospasm, hot flushes, transient hemianopia, muscle weakness; also reported erythromelalgia
Dose

- Prevention of lactation (but see notes above and under Contra-indications), during first day postpartum, 1 mg as a single dose; suppression of established lactation (but see notes above) 250 micrograms every 12 hours for 2 days; CHILD under 16 years, not recommended
- Hyperprolactinaemic disorders, 500 micrograms weekly (as a single dose or as 2 divided doses on separate days) increased at monthly intervals in steps of 500 micrograms until optimal therapeutic response (usually 1 mg weekly, range 0.25–2 mg weekly) with monthly monitoring of serum prolactin levels; reduce initial dose and increase more gradually if patient intolerant; over 1 mg weekly give as divided doses; up to 4.5 mg weekly has been used in hyperprolactinaemic patients; CHILD under 16 years, not recommended
- Parkinson’s disease, section 4.9.1

Cabergoline (Non-proprietary)

Tablet, scored, cabergoline 500 micrograms, net price 8-tab pack = £34.03. Label: 10, 21, counselling, driving, see notes above

Note
Dispense in original container (contains desiccant)

Dostinex® (Pharmacia)

Tablets, scored, cabergoline 500 micrograms. Net price 8-tab pack = £30.04. Label: 10, 21, counselling, driving, see notes above

Note
Dispense in original container (contains desiccant)

QUINAGOLIDE

Indications see notes above and under Dose

Cautions see notes above; history of psychotic illness; advise non-hormonal contraception if pregnancy not desired; interactions: Appendix 1 (quinagolide)

Contra-indications hypersensitivity to quinagolide (but not ergot alkaloids)

Hepatic impairment avoid—no information available

Renal impairment avoid—no information available

Pregnancy discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed)

Breast-feeding suppresses lactation

Side-effects nausea, vomiting, anorexia, abdominal pain, constipation or diarrhoea; syncope, hypotension (see also notes above), oedema, flushing; nasal congestion, headache, dizziness, fatigue, insomnia; rarely sudden onset of sleep (see notes above); very rarely psychosis

Dose

- Hyperprolactinaemia, 25 micrograms at bedtime for 3 days; increased at intervals of 3 days in steps of 25 micrograms to usual maintenance dose of 75–150 micrograms daily; for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks; CHILD not recommended

Norprolac® (Ferring)

Tablets, quinagolide (as hydrochloride) 75 micrograms (white), net price 30-tab pack = £27.00; starter pack of 3 x 25-microgram tabs (pink) with 3 x 50-microgram tabs (blue) = £4.50. Label: 10, 21, counselling, driving, see notes above

Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and antiprogestogenic activity. It is licensed for the treatment of endometriosis and for the relief of severe pain and tenderness in benign fibrocystic breast disease where other measures have proved unsatisfactory. It may also be effective in the long-term management of hereditary angioedema [unlicensed indication].

Cetrorelix and ganirelix are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle-stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

CETRORELIX

Indications adjunct in the treatment of female infertility (under specialist supervision)

Hepatic impairment avoid in moderate or severe liver impairment

Renal impairment avoid in moderate or severe renal impairment

Pregnancy avoid in confirmed pregnancy

Breast-feeding avoid

Side-effects nausea, headache, injection site reactions; rarely hypersensitivity reactions

Dose

- By subcutaneous injection into the lower abdominal wall, either 250 micrograms in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation); continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction) or 3 mg on day 7 of ovarian stimulation with gonadotrophins; if ovulation induction not possible on day 5 after 3-mg dose, additional 250 micrograms once daily until day of ovulation induction

Cetrotide® (Merck Serono)

Injection, powder for reconstitution, cetrorelix (as acetate), net price 250-micrograms vial = £22.61; 3-mg vial = £158.26 (both with solvent)

DANAZOL

Indications see notes above and under Dose

Cautions cardiac impairment (avoid if severe), elderly, polycythaeemia, epilepsy, diabetes mellitus, hypertension, migraine, lipoprotein disorder; history of thrombosis or thromboembolic disease; withdrawal if virilisation (may be irreversible on continued use); non-hormonal contraceptive methods should be used, if appropriate; interactions: Appendix 1 (danazol)

Contra-indications ensure that patients with amenorrhoea are not pregnant; thromboembolic disease; undiagnosed genital bleeding; androgen-dependent tumours; acute porphyria (section 9.8.2)

Hepatic impairment caution in hepatic impairment (avoid if severe)

Renal impairment caution in renal impairment (avoid if severe)
Pregnancy avoid; has weak androgenic effects and virilisation of female fetus reported

Breast-feeding no data available but avoid because of possible androgenic effects in infant

Side-effects nausea, dizziness, skin reactions including rashes, photosensitivity and exfoliative dermatitis, fever, backache, nervousness, mood changes, anxiety, changes in libido, vertigo, fatigue, epigastric and pleuritic pain, headache, weight gain; menstrual disturbances, vaginal dryness and irritation, flushing and reduction in breast size; musculo-skeletal spasm, joint pain and swelling, hair loss; androgenic effects including acne, oily skin, oedema, hirsutism, voice changes and rarely clitoral hypertrophy (see also Cautions); temporary alteration in lipoproteins and other metabolic changes, insulin resistance; thrombotic events; leucopenia, thrombocytopenia, eosinophilia, reversible erythrocytosis or polycythaemia reported; headache and visual disturbances may indicate benign intracranial hypertension; rarely cholestatic jaundice, pancreatitis, peliosis hepatitis and benign hepatic adenomata

Dose Note. In women of child-bearing potential, treatment should start during menstruation, preferably on day 1. Doses of 300 mg daily in divided doses usually for 3–6 months

Hereditary angioedema [unlicensed indication], between 300 mg daily in divided doses, adjusted to achieve amenorrhoea, usually for 3–6 months

In women of child-bearing potential, treatment should be given during menstruation or shortly afterwards. Contra-indicated for use longer than 6 months in the treatment of endometriosis (do not repeat) and when there is unexplained vaginal bleeding.

Gonadorelin analogues Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertiltiy, anaemia due to uterine fibroids (together with iron supplementation), breast cancer (section 8.3.4.1), prostate cancer (section 8.3.4.2) and before intra-uterine surgery. Use of leuprorelin and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

Cautions Non-hormonal, barrier methods of contraception should be used during entire treatment period with gonadorelin analogues; also use with caution in patients with metabolic bone disease because decrease in bone mineral density can occur.

Contra-indications Gonadorelin analogues are contra-indicated for use longer than 6 months in the treatment of endometriosis (do not repeat) and when there is unexplained vaginal bleeding.

Pregnancy The use of gonadorelin analogues in pregnancy is contra-indicated. Pregnancy should be excluded before treatment; the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

Breast-feeding Gonadorelin analogues are contra-indicated in breast-feeding.

Side-effects Side-effects of the gonadorelin analogues related to the inhibition of oestrogen production include menopausal-like symptoms (e.g. hot flushes, increased sweating, vaginal dryness, dyspareunia and loss of libido) and a decrease in trabecular bone density; these effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone). Side-effects of gonadorelin analogues also include headache (rarely migraine) and hypersensitivity reactions including urticaria, pruritus, rash, asthma and anaphylaxis; when treating uterine fibroids, bleeding associated with fibroid degeneration can occur; spray formulations can cause irritation of the nasal mucosa including nose bleeds; local reactions at injection site can occur; other side-effects also reported with some gonadorelin analogues include palpitation, hypertension, ovarian cysts (may require withdrawal), changes in breast size, musculoskeletal pain or weakness, visual disturbances, paraesthesia, changes in scalp and body hair, oedema of the face and extremities, weight changes, and mood changes including depression.

Danazol (Non-proprietary) [704]

Capsules, danazol 100 mg, net price 28-cap pack = £18.40, 60-cap pack = £17.04; 200 mg, 56-cap pack = £66.20

Danof® (Sanofi-Aventis) [704]

Capsules, danazol 100 mg (grey/white), net price 60-cap pack = £16.38; 200 mg (pink/white), 60-cap pack = £32.43

GANIRELIX

Indications adjunct in the treatment of female infertility (under specialist supervision)

Hepatic impairment avoid in moderate or severe hepatic impairment

Renal impairment avoid in moderate to severe renal impairment

Pregnancy avoid in confirmed pregnancy—toxicity in animal studies

Breast-feeding avoid—no information available

Side-effects nausea, headache, malaise, injection-site reactions; very rarely hypersensitivity reactions including rash, facial oedema, and dyspnoea also reported

Dose By subcutaneous injection preferably into the upper leg (rotate injection sites to prevent lipoatrophy). 250 micrograms in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins; continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction)

Orgalan® (Organon) [704]

Injection, ganirelix, 500 micrograms/mL, net price 0.5-mL prefilled syringe = £21.48

Gonadorelin analogues

Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, anaemia due to uterine fibroids (together with iron supplementation), breast cancer (section 8.3.4.1), prostate cancer (section 8.3.4.2) and before intra-uterine surgery. Use of leuprorelin and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

Cautions Non-hormonal, barrier methods of contraception should be used during entire treatment period with gonadorelin analogues; also use with caution in patients with metabolic bone disease because decrease in bone mineral density can occur.

Contra-indications Gonadorelin analogues are contra-indicated for use longer than 6 months in the treatment of endometriosis (do not repeat) and when there is unexplained vaginal bleeding.

Pregnancy The use of gonadorelin analogues in pregnancy is contra-indicated. Pregnancy should be excluded before treatment; the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

Breast-feeding Gonadorelin analogues are contra-indicated in breast-feeding.

Side-effects Side-effects of the gonadorelin analogues related to the inhibition of oestrogen production include menopausal-like symptoms (e.g. hot flushes, increased sweating, vaginal dryness, dyspareunia and loss of libido) and a decrease in trabecular bone density; these effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone). Side-effects of gonadorelin analogues also include headache (rarely migraine) and hypersensitivity reactions including urticaria, pruritus, rash, asthma and anaphylaxis; when treating uterine fibroids, bleeding associated with fibroid degeneration can occur; spray formulations can cause irritation of the nasal mucosa including nose bleeds; local reactions at injection site can occur; other side-effects also reported with some gonadorelin analogues include palpitation, hypertension, ovarian cysts (may require withdrawal), changes in breast size, musculoskeletal pain or weakness, visual disturbances, paraesthesia, changes in scalp and body hair, oedema of the face and extremities, weight changes, and mood changes including depression.
BUSERELIN

Indications see under Dose; prostate cancer (section 8.3.4.2).

Cautions see notes above; polycystic ovarian disease, depression, hypertension, diabetes.

Contra-indications see notes above; hormone-dependent tumours.

Pregnancy see notes above.

Breast-feeding see notes above.

Side-effects see notes above; initially withdrawal bleeding and subsequently breakthrough bleeding, leucorrhoea; nausea, vomiting, constipation, diarrhoea; anxiety, memory and concentration disturbances, sleep disturbances, nervousness, dizziness, drowsiness; breast tenderness, lactation; abdominal pain; fatigue; increased thirst, changes in appetite; acne, dry skin, splitting nails, dry eyes; altered blood lipids, leucopenia, thrombocytopenia; hearing disturbances; reduced glucose tolerance.

Dose
- Endometriosis, intranasally, 300 micrograms (one 150-microgram spray in each nostril) 3 times daily (starting on days 1 or 2 of menstruation); max. duration of treatment 6 months (do not repeat).
- Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), by subcutaneous injection, 200–500 micrograms daily given as a single injection (occasionally up to 500 micrograms twice daily may be needed) starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of choric gonadotrophin at appropriate stage of follicular development).

Preparation Section 8.3.4.2.

LEUPRORELIN ACETATE

Indications see under Dose; prostate cancer (section 8.3.4.2).

Cautions see notes above; monitor liver function; family history of osteoporosis; chronic use of other drugs which reduce bone density including alcohol and tobacco; diabetes.

Contra-indications see notes above.

Pregnancy teratogenic in animal studies; see also notes above.

Breast-feeding see notes above.

Side-effects see notes above; breast tenderness; nausea, vomiting, diarrhoea, anorexia; fever, chills; sleep disturbances, dizziness, fatigue, leucopenia, thrombocytopenia, altered blood lipids, pulmonary embolism; spinal fracture, paralysis, hypotension and worsening of depression also reported.

Dose
- By subcutaneous or intramuscular injection (as Prostap® SR)
  - Endometriosis, 3.75 mg as a single dose in first 5 days of menstrual cycle then every month for max. 6 months (course not to be repeated).
  - Endometrial thinning before intra-uterine surgery, 3.75 mg as a single dose (given between days 3 and 5 of menstrual cycle) 5–6 weeks before surgery.
  - Reduction of size of uterine fibroids and of associated bleeding before surgery, 3.75 mg as a single dose every month for 3–4 months (max. 6 months).
- By intramuscular injection (as Prostap®).
  - Endometriosis, 11.25 mg as a single dose in first 5 days of menstrual cycle then every 3 months for max. 6 months (course not to be repeated).

Preparations Section 8.3.4.2.
6.7.3 Metrapone and trilostane

**NAFARELIN**

**Indications** see under Dose

**Cautions** see notes above

**Contra-indications** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; acne

**Dose**

- Endometriosis, women over 18 years, 200 micrograms twice daily as one spray in each nostril in the morning and one spray in the other nostril in the evening (starting on days 2–4 of menstruation), max. duration of treatment 6 months (do not repeat)

- Pituitary desensitisation before induction of ovulation for *in vitro* fertilisation (under specialist supervision), 400 micrograms (one spray in each nostril) twice daily starting in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity); discontinue if down-regulation not achieved within 12 weeks

**Counselling** Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration

**Synarel®** (Pharmacia) (PN)

Nasal spray, nafarelin (as acetate) 200 micrograms/ metered spray. Net price 30-dose unit = £30.41; 60-dose unit = £52.43. Label: 10, patient information leaflet, counselling, see above

**TRIPTORELIN**

**Indications** endometriosis, precocious puberty, reduction in size of uterine fibroids; advanced prostate cancer (section 8.3.4.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also gastro-intestinal disturbances; in precocious puberty, withdrawal bleeding may occur in the first month of treatment; asthenia

**Dose**

- See under preparations below

**Decapetyn® SR** (Ipsen) (PN)

Injection, (powder for suspension), m/r, triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00

**Dose** by intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3 mg every 4 weeks starting during first 5 days of menstrual cycle for uterine fibroids continue treatment for at least 3 months; max. duration of treatment 6 months (not to be repeated)

**Note** Each vial includes an overage to allow accurate administration of 3-mg dose

**Injection**, (powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

**Dose** by intramuscular injection, endometriosis, 11.25 mg every 3 months starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)

**Gonapeptin Depot®** (Ferring) (PN)

**Injection**, (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69

**Dose** by subcutaneous or deep intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3.75 mg every 4 weeks starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)

Precocious puberty, body-weight over 30 kg, initially 3.75 mg every 2 weeks for 3 doses; then every 3–4 weeks; body-weight 20–30 kg, initially 2.5 mg every 2 weeks for 3 doses; then every 3–4 weeks; body-weight under 20 kg, initially 1.875 mg every 2 weeks for 3 doses; then every 3–4 weeks; discontinue when bone maturation consistent with age over 12 years in girls or over 13 years in boys

**Breast pain (mastalgia)**

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics (section 4.7.1); moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

**Danazol** (section 6.7.2) is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

**Tamoxifen** (section 8.3.4.1) may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

**6.7.3 Metrapone and trilostane**

**Metrapone** is a competitive inhibitor of 11β-hydroxylase in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. It may be used as a test of anterior pituitary function.

Although most types of Cushing's syndrome are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metrapone has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing's syndrome to prepare the patient for surgery. The dosages used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

**Trilostane** reversibly inhibits the enzyme system essential for the production of mineralocorticoids and gluco-
corticoids in the adrenal cortex, and may be useful in Cushing’s syndrome and primary hyperaldosteronism. Trilostane appears to be less effective than metyrapone for Cushing’s syndrome (where it is tailored to corticosteroid production). It also has a minor role in postmenopausal breast cancer that has relapsed following initial oestrogen antagonist therapy (corticosteroid replacement therapy is also required). Ketoconazole (section 5.2.2) is also used by specialists for the management of Cushing’s syndrome [unlicensed indication].

### METRAPONE

**Indications** see notes above and under Dose (specialist supervision in hospital)

**Cautions** gross hypopituitarism (risk of precipitating acute adrenal failure); hypertension on long-term administration; hypothyroidism (delayed response); many drugs interfere with diagnostic estimation of steroids; avoid in acute porphyria (section 9.8.2) Driving Drowsiness may affect the performance of skilled tasks (e.g. driving)

**Contra-indications** adrenocortical insufficiency (see Cautions)

**Hepatic impairment** use with caution in hepatic impairment (delayed response)

**Pregnancy** avoid (may impair biosynthesis of fetal-placental steroids)

**Breast-feeding** avoid—no information available

**Side-effects** occasional nausea, vomiting, dizziness, headache, hypotension, sedation; rarely abdominal pain, allergic skin reactions, hypoadrenalism, hirsutism

**Dose**

- Differential diagnosis of ACTH-dependent Cushing’s syndrome, 750 mg every 4 hours for 6 doses; CHILD 15 mg/kg (minimum 250 mg) every 4 hours for 6 doses
- Management of Cushing’s syndrome, range 0.25–6 g daily; tailored to cortisol production; see notes above
- Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) 3 g daily in divided doses

**Metopirone** (Alliance) SH

Capsules, ivory, metyrapone 250 mg, net price 100-tab pack = £38.88. Label: 21, counselling, driving

### TRILOSTANE

**Indications** see notes above and under Dose (specialist supervision)

**Cautions** breast cancer (concurrent corticosteroid replacement therapy needed, see under Dose); adrenal cortical hyperfunction (tailored to cortisol and electrolytes, concurrent corticosteroid therapy may be needed, see under Dose); **interactions**: Appendix 1 (trilostane)

**Contra-indications** children

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** avoid; interferes with placental sex hormone production; use non-hormonal method of contraception

**Breast-feeding** avoid

---

**Side-effects** flushing, tingling and swelling of mouth, rhinorrhoea, nausea, vomiting, diarrhoea, and rashes reported; rarely granulocytopenia

**Dose**

- Adrenal cortical hyperfunction, 240 mg daily in divided doses for at least 3 days then tailored according to response with regular monitoring of plasma electrolytes and circulating corticosteroids (both mineralocorticoid and glucocorticoid replacement therapy may be needed); usual dose: 120–480 mg daily (may be increased to 960 mg)
- Postmenopausal breast cancer (with glucocorticoid replacement therapy) following relapse to initial oestrogen receptor antagonist therapy, initially 240 mg daily increased every 3 days in steps of 240 mg to a maintenance dose of 960 mg daily (720 mg daily if not tolerated)

**Modrenal** (Bioenvision) NH

Capsules, trilostane 60 mg (pink/black), net price 100-cap pack = £49.50; 120 mg (pink/yellow), 100-cap pack = £98.50. Label: 21

---

### 6.7.4 Somatomedins

Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). **Mecasermin**, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotropic effects of human growth hormone and is used to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

#### MECASERMIN

(Recombinant human insulin-like growth factor-I; rhIGF-I)

**Indications** see notes above

**Cautions** correct hypothyroidism before initiating treatment; diabetes mellitus (adjustment of antidiabetic therapy may be necessary), monitor ECG before and on termination of treatment (and during treatment if ECG abnormal), papilloedema (see under Side-effects), monitor for disorders of the epiphysis of the hip (monitor for limping), monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions)

**Contra-indications** evidence of tumour activity (discontinue treatment)

**Pregnancy** avoid unless essential; contraception advised in women of child-bearing potential

**Breast-feeding** avoid

**Side-effects** headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); cardiomegaly, ventricular hypertrophy, tachycardia; convulsions, sleep apnoea, night terrors, dizziness, nervousness; tonsillar hypertrophy (see Cautions above); hypoglycaemia (especially in first month, and in younger children), hyperglycaemia, gynaecomastia; arthralgia, myalgia; visual disturbance, impaired hearing; antibody formation; injection-site reactions (rotate site)

---

**BNF 61 6.7.4 Somatomedins 483**
Dose

By subcutaneous injection, ADOLESCENT and CHILD over 2 years, initially 40 micrograms/kg twice daily for 1 week, if tolerated increase dose in steps of 40 micrograms/kg to max. 120 micrograms/kg twice daily; discontinue if no response within 1 year.

Counselling: Dose should be administered just before or after food; do not increase dose if a dose is missed.

Note: Reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat.

Increlex® (Ipsen) ▼
Injection, mecasermin 10 mg/mL, net price 4-mL vial = £605.00. Counselling, administration
Excipients include benzyl alcohol (avoid in neonates; see Excipients, p. 2).
7 Obstetrics, gynaecology, and urinary-tract disorders

7.1 Drugs used in obstetrics

7.1.1 Prostaglandins and oxytocics

7.3.1 Combined hormonal contraceptives

7.3.2 Progestogen-only contraceptives

7.3.2.1 Oral progestogen-only contraceptives

7.3.2.2 Parenteral progestogen-only contraceptives

7.3.2.3 Intra-uterine progestogen-only device

7.3.3 Spermicidal contraceptives

7.3.4 Contraceptive devices

7.3.5 Emergency contraception

7.4 Drugs for genito-urinary disorders

7.4.1 Drugs for urinary retention

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

7.4.3 Drugs used in urological pain

7.4.4 Bladder instillations and urological surgery

7.4.5 Drugs for erectile dysfunction

For hormonal therapy of gynaecological disorders see section 6.4.1 (including HRT), section 6.5.1 and section 6.7.2.

7.1 Drugs used in obstetrics

7.1.1 Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin, carbetocin, ergometrine, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

Induction of abortion Gemeprost, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin misoprostol (section 7.1.2) is given by mouth or by vaginal administration to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extravesical dinoprostone is rarely used nowadays.

Pre-treatment with mifepristone (section 7.1.2) can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Induction and augmentation of labour Dinoprostone is available as vaginal tablets, pessaries and
vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

**Oxytocin** (Syntocinon®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hypertension avoided. Large doses of oxytocin may result in excessive fluid retention.

**Misoprostol** is given orally or vaginally for the induction of labour [unlicensed indication].

**Prevention and treatment of haemorrhage**

Bleeding due to incomplete abortion can be controlled with ergometrine and oxytocin (Syntometrine®) given intramuscularly. The dose is adjusted according to the patient's condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine 500 micrograms with oxytocin 5 units (Syntometrine® 1 mL) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin 5 units by slow intravenous injection (dose may be repeated), followed in severe cases by intravenous infusion of oxytocin 40 units in 500 mL infusion fluid (prolonged administration—see Appendix 6) at a rate that controls uterine atony or
- ergometrine 250–500 micrograms by intramuscular injection or
- ergometrine 250–500 micrograms by slow intravenous injection (use with caution—risk of hypotension) or
- ergometrine 500 micrograms with oxytocin 5 units (Syntometrine® 1 mL) by intramuscular injection

**Carboprost** has an important role in severe postpartum haemorrhage unresponsive to ergometrine and oxytocin.

**Misoprostol** [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine, and carboprost are not available or are inappropriate.

---

**CARBETOCIN**

**Indications** prevention of uterine atony after caesarean section

**Cautions** hyponatraemia; cardiovascular disease (avoid if severe); migraine; asthma

**Contra-indications** pre-eclampsia and eclampsia; epilepsy

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** manufacturer advises avoid

**Side-effects** nausea, vomiting, abdominal pain, metallic taste; flushing, hypotension, chest pain; dyspnoea; headache, tremor, dizziness; anaemia; back pain; pruritus; feeling of warmth, chills; tachycardia and sweating also reported

**Dose**

- By slow intravenous injection over 1 minute, a single dose of 100 micrograms, as soon as possible after delivery, preferably before removal of placenta

**Pabalin®** (Ferring) £18.20 (hosp. only)

**Injection** carboprost 100 micrograms/mL, net price 1-mL amp = £17.64

---

**CARBOPROST**

**Indications** postpartum haemorrhage due to uterine atony in patients unresponsive to ergometine and oxytocin

**Cautions** history of glaucoma or raised intra-ocular pressure, asthma, hypertension, hypotension, anaemia, jaundice, diabetes, epilepsy; uterine scars; excessive dosage may cause uterine rupture; **interactions**: Appendix 1 (prostaglandins)

**Contra-indications** untreated pelvic infection; cardiac or pulmonary disease

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** manufacturer advises avoid

**Side-effects** nausea, vomiting and diarrhoea, hypertension and flushing, bronchospasm; less frequent effects include raised blood pressure, dyspnoea, and pulmonary oedema; chills, headache, diaphoresis, dizziness; cardiovascular collapse also reported; erythema and pain at injection site reported

**Dose**

- By deep intramuscular injection, 250 micrograms repeated if necessary at intervals of not less than 15 minutes; total dose should not exceed 2 mg (8 doses)

**Hemabate®** (Pharmacia) £18.20 (hosp. only)

**Injection** carbetocin as trometamol salt (tromethamine salt) 250 micrograms/mL, net price 1-mL amp = £18.20 (hosp. only)

---

**DINOPROSTONE**

**Indications** see notes above and under preparations below

**Cautions** history of asthma, glaucoma and raised intra-ocular pressure; hypertension; history of epilepsy; uterine scarring; monitor uterine activity and fetal status (particular care if history of uterine hypertony); uterine rupture; see also notes above; monitor for disseminated intravascular coagulation after partrumion; risk factors for disseminated intravascular coagulation; effect of oxytocin enhanced (care needed in monitoring uterine activity when used in sequence); **interactions**: Appendix 1 (prostaglandins)

**Contra-indications** active cardiac, or pulmonary disease; placenta praevia or unexplained vaginal bleeding during pregnancy, ruptured membranes, major cephalopelvic disproportion or fetal malpresentation, history of caesarean section or major uterine surgery,
untreated pelvic infection, fetal distress, grand multiparas and multiple pregnancy, history of difficult or traumatic delivery; avoid extra-amniotic route in cervicitis or vaginitis

**Hepatic impairment** manufacturers advise avoid

**Renal impairment** manufacturers advise avoid

**Side-effects** nausea, vomiting, diarrhoea; other side-effects include uterine hypertonus, severe uterine contractions, pulmonary or amniotic fluid embolism, abruptio placenta, fetal distress, maternal hypertension, bronchospasm, rapid cervical dilation, fever, backache; uterine hypercontractility with or without fetal bradycardia, low Apgar scores; cardiac arrest, uterine rupture, stillbirth or neonatal death also reported; vaginal symptoms (warmth, irritation, pain); after intravenous administration—flushing, shivering, headache, dizziness, temporary pyrexia and raised white blood cell count; disseminated intravascular coagulation reported; also local tissue reaction and erythema after intrauterine administration and possibility of infection after extra-amniotic administration

**Dose**

- See under preparations, below

**Important** Do not confuse dose of Prostin E2® vaginal gel with that of Prostin E2® vaginal tablets—not bioequivalent.

**Propess** (Ferring)®

**Pessaries** (within retrieval device), releasing dinoprostone approx. 10 mg over 24 hours; net price 1-pessary pack = £30.00

**Dose** by vagina, cervical ripening and induction of labour at term, 1 pessary (in retrieval device) inserted high into posterior fornix and removed when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

Prostin E2® (Pharmacia)®

**Intravenous solution** for dilution and use as an infusion, dinoprostone 1 mg/mL, net price 0.75-mL amp = £8.52; 10 mg/mL, 0.5-mL amp = £18.40 (both hosp. only; rarely used, consult product literature for dose and indications)

**Extra-amniotic solution** dinoprostone 10 mg/mL, net price 0.5-mL amp (with diluent) = £18.40 (hosp. only; less commonly used nowadays, consult product literature for dose and indications)

**Vaginal gel**, dinoprostone 400 micrograms/mL, net price 2.5 mL (1 mg) = £13.28; 800 micrograms/mL, 2.5 mL (2 mg) = £13.28

**Dose** by vagina, induction of labour, inserted high into posterior fornix (avoid administration into cervical canal), 1 mg (unfavourable primigravida 2 mg), followed after 6 hours by 1–2 mg if required; max. [gel] 3 mg (unfavourable primigravida 4 mg)

**Vaginal tablets**, dinoprostone 3 mg, net price 8-vaginal tab pack = £106.23

**Dose** by vagina, induction of labour, inserted high into posterior fornix, 3 mg, followed after 6–8 hours by 3 mg if labour is not established; max. 6 mg [vaginal tablets]

**Note** Prostin E2 Vaginal Gel and Vaginal Tablets are not bioequivalent

**GEMEPROST**

**Indications** see under Dose

**Cautions** obstructive airways disease, cardiovascular insufficiency, raised intra-ocular pressure, cervicitis or vaginitis; **interactions**: Appendix 1 (prostaglandins)

**Important** For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Mifepristone and Note below

**Contra-indications** unexplained vaginal bleeding, uterine scarring, placenta praevia

**Renal impairment** manufacturer advises avoid

**Side-effects** vaginal bleeding and uterine pain; nausea, vomiting, or diarrhoea; headache, muscle weakness, dizziness, flushing, chills, backache, dyspnoea, chest pain, palpitation and mild pyrexia; uterine rupture reported (most commonly in multiparas or if history of uterine surgery or if given with intravenous oxytocics); also reported severe hypertension, coronary artery spasm and myocardial infarction

**Dose**

- **By vagina**, cervical ripening prior to first trimester surgical abortion, 1 mg inserted into posterior fornix 3 hours before surgery
- **Second trimester abortion**, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations; second course may begin 24 hours after start of treatment (if treatment fails pregnancy should be terminated by another method)
- **Second trimester intra-uterine death**, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations only; monitor for coagulopathy

**Note** If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours

**Gemeprost** (Sanofi-Aventis)®

**Pessaries**, gemeprost 1 mg, net price 5-pessary pack = £215.00

**7.1.1 Prostaglandins and oxytocics**

**Hepatic impairment** manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain; chest pain, arrhythmias (including bradycardia), palpitation, hypertension, vasocostriction; dyspnoea, pulmonary oedema; headache, dizziness; tinnitus; rash; very rarely myocardial infarction

**Dose**

- See notes above

**Ergometrine** (Non-proprietary)®

**Injection**, ergometrine maleate 500 micrograms/mL, net price 1-mL amp = 60p

**With oxytocin**

**Syntometrine®** (Alliance)®

**Injection**, ergometrine maleate 500 micrograms, oxytocin 5 units/mL, net price 1-mL amp = £1.35

**Dose** by intramuscular injection, 1 mL by intravenous injection, no longer recommended
7.1.2 Mifepristone

**OXYTOCIN**

**Indications** see under Dose and notes above

**Cautions** induction or enhancement of labour—pressure of borderline cephalopelvic disproportion (avoid if significant); secondary uterine inertia; moderate pregnancy-induced hypertension or cardiac disease, women over 35 years or with history of lower-uterine segment caesarean section (see also under Contra-indications below); risk factors for disseminated intravascular coagulation; monitor for disseminated intravascular coagulation after parturition; avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication—see also Appendix 6); effects enhanced by concomitant prostaglandins (very careful monitoring of uterine activity); caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors); see also interactions: Appendix 1 (oxytocin)

**Contra-indications** hypertonic uterine contractions, fetal distress; any condition where spontaneous labour or vaginal delivery inadvisable; avoid prolonged administration in oxytocin-resistant uterine inertia, severe pre-eclamptic toxemia, or severe cardiovascular disease

**Side-effects** nausea; vomiting; arhythmia; headache; rarely disseminated intravascular coagulation, rash, and anaphylactoid reactions (with dyspnoea, hypotension, or shock); uterine spasm (may occur at low doses), uterine hyperstimulation (usually with excessiv doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture); water intoxication and hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid (see also under Dose below); placental abruption and amniotic fluid embolism also reported on overdose

**Dose**

- Induction of labour for medical reasons or stimulation of labour in hypotonic uterine inertia, by intravenous infusion (not to be started for at least 6 hours after administration of vaginal prostaglandin), initially 0.001–0.004 units/minute, increased at intervals of at least 10 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute; if regular contractions not established after total of 5 units stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

  **Important** Careful monitoring of fetal heart rate and uterine motility essential for dose titration (avoid intravenous injection during labour), discontinue immediately in uterine hyperactivity or fetal distress

- Caesarean section, by slow intravenous injection immediately after delivery, 5 units
- Prevention of postpartum haemorrhage, after delivery of placenta, by slow intravenous injection, 5 units (if infusion used for induction or enhancement of labour, increase rate during third stage and for next few hours)

  **Important** Avoid rapid intravenous injection (may transiently reduce blood pressure)

  **Note** Can be given in a dose of 10 units by intramuscular injection (unlicensed route) instead of oxytocin with ergometrine (Syntometrine®), see notes above

- Treatment of postpartum haemorrhage, by slow intravenous injection, 5 units (dose may be repeated), followed in severe cases by intravenous infusion of 40 units in 500 mL infusion fluid at a rate sufficient to control uterine atony

  **Important** Avoid rapid intravenous injection (may transiently reduce blood pressure); prolonged administration, see warning below

- Incomplete, inevitable, or missed abortion, by slow intravenous injection, 5 units followed if necessary by intravenous infusion, 0.02–0.04 units/minute or faster

  **Important** Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed abortion or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing infusate (i.e., not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

  **Note** Oxytocin doses in the BNF may differ from those in the product literature

**Syntocinon® (Alliance)**

- **Injection**, oxytocin, net price 5 units/mL, 1-mL amp = 76p; 10 units/mL, 1-mL amp = 86p

  **With ergometrine**

  See Syntometrine®, p. 487

**7.1.1 Drugs affecting the ductus arteriosus**

This section is not included in the BNF. For the management of ductus arteriosus, see BNF for Children section 2.14.

**7.1.2 Mifepristone**

Mifepristone, an antiprogestogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix. For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]). Guidelines of the Royal College of Obstetricians and Gynaecologists (September 2004) include the following [unlicensed] regimen for inducing medical abortion:

- For gestation up to 9 weeks, mifepristone 200 mg by mouth followed 1–3 days later by misoprostol 800 micrograms vaginally in women at more than 7 weeks gestation (49–63 days), if the abortion has not occurred 4 hours after misoprostol, a further dose of misoprostol 400 micrograms may be given vaginally or by mouth

- For gestation between 9 and 13 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally followed if necessary by a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms vaginally or by mouth

- For gestation between 13 and 24 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally then a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms by mouth

**MIFEPRISTONE**

**Indications** see under dose

**Cautions** asthma (avoid if severe and uncontrolled); haemorrhagic disorders and anticoagulant therapy; prosthetic heart valve or history of endocarditis (see

**BNF 61**
section 5.1 table 2); risk factors for or existing cardio-vascular disease; adrenal suppression (may require corticosteroids); interactions: Appendix 1 (mifepristone).

**Important** For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Gemeprost.

**Contra-indications** uncontrolled severe asthma; suspected ectopic pregnancy (use other specific means of termination); chronic adrenal failure; acute porphyria (section 9.8.2).

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** manufacturer advises avoid

**Side-effects** gastro-intestinal cramps; uterine contractions, vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery); less commonly hypersensitivity reactions including rash and urticaria; rarely hypotension, malaise, headache, fever, hot flushes, dizziness, and chills; infections (including toxic shock syndrome) also reported

**Dose**
- Medical termination of intra-uterine pregnancy of up to 49 days gestation, by mouth, mifepristone 600 mg as a single dose under medical supervision followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth [unlicensed]; alternative regimen, mifepristone 200 mg by mouth as a single dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
- Medical termination of intra-uterine pregnancy of 50–63 days gestation, by mouth, mifepristone 600 mg (200 mg also effective) as a single dose under medical supervision, followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
- Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation, by mouth, mifepristone 200 mg as a single dose under medical supervision 36–48 hours before procedure
- Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin), by mouth, mifepristone 600 mg (200 mg may be effective) as a single dose under medical supervision followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol (see above [unlicensed]); if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

**Note** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost (pessary risk of profound hypotension)
- Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate, by mouth, mifepristone 600 mg daily as a single dose for 2 days under medical supervision; if labour not started within 72 hours of first dose, another method should be used

### 7.1.3 Myometrial relaxants

**Mifepriste**® (Nordic) Tablets, yellow, mifepristone 200 mg, net price 3-tab pack = £52.66 (supplied to NHS hospitals and premises approved under Abortion Act 1967). Label: 10, patient information leaflet

**ATOSIBAN**

**Indications** uncomplicated premature labour (see notes above)

**Cautions** monitor blood loss after delivery; intra-uterine growth restriction; abnormal placental site

**Contra-indications** eclampsia and severe pre-eclampsia, intra-uterine infection, intra-uterine fetal death, antepartum haemorrhage (requiring immediate delivery), placenta praevia, abruptio placenta, intra-uterine growth restriction with abnormal fetal heart rate, premature rupture of membranes after 30 weeks' gestation

**Hepatic impairment** no information available

**Renal impairment** no information available

**Side-effects** nausea, vomiting, tachycardia, hypertension, headache, dizziness, hot flushes, hyperglycaemia, injection-site reaction; less commonly pruritus, rash, fever, insomnia
7 Obstructive, gynaecology, and urinary-tract disorders

7.1.3 Myometrial relaxants

**Dose**
- By intravenous injection, initially 6.75 mg over 1 minute, then by intravenous infusion 18 mg/hour for 3 hours, then 6 mg/hour for up to 45 hours; max. duration of treatment 48 hours

**Tractocile** (Ferring)
Injection, atosiban (as acetate) 7.5 mg/mL, net price 0.9-mL (6.75-mg) vial = £18.41
Concentrate for intravenous infusion, atosiban (as acetate) 7.5 mg/mL, net price 5-mL vial = £52.82

**Beta2 agonists**

**Cautions**
Beta2 agonists should be used with caution in patients with suspected cardiovascular disease (such patients should be assessed by a cardiologist before initiating therapy—see also Contra-indications, below), hypertensin, mild to moderate pre-eclampsia, hyperthyroidism, and hypokalaemia (particular risk with potassium-depleting diuretics—see also Hypokalaemia, p. 176). It is important to monitor pulse rate (should not exceed 140 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), and the patient’s fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs). Beta2 agonists should also be used with caution in diabetes—monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially with intravenous beta, agonists).

**Contra-indications**
Beta2 agonists are contra-indicated in cardiac disease and in patients with significant risk factors for myocardial ischaemia; they should also be avoided in antepartum haemorrhage, intra-uterine infection, intra-uterine fetal death, placenta praevia, abruptio placentae, threatened miscarriage, cord compression, and eclampsia or severe pre-eclampsia.

**Side-effects**
Side-effects of the beta2 agonists include tachycardia, arrhythmias, myocardial ischaemia, peripheral vasodilation, headache, tremor, hyperglycaemia, hypokalaemia, muscle cramps and tension, and hypersensitivity reactions (including angioedema, urticaria, rash, bronchospasm, hypotension, and collapse).

**RITODRINE HYDROCHLORIDE**

**Indications**
uncomplicated premature labour (see notes above)

**Cautions**
see notes above; also reported sleep disturbances and behavioural disturbances

**Contra-indications**
see notes above

**Dose**
- By intravenous infusion (important: minimum fluid volume, see below), initially 50 micrograms/minute, increased gradually according to response by 50 micrograms/minute every 10 minutes until contractions stop or maternal heart rate reaches 140 beats per minute; continue for 12–48 hours after contractions cease (usual rate 150–350 micrograms/minute); max. rate 350 micrograms/minute; or by intramuscular injection, 10 mg every 3–8 hours continued for 12–48 hours after contractions have ceased; then by mouth (but see notes above), 10 mg 30 minutes before termination of intravenous infusion, repeated every 2 hours for 24 hours, followed by 10–20 mg every 4–6 hours, max. oral dose 120 mg daily

**Important**
Manufacturer states that although fatal pulmonary oedema associated with ritodrine infusion is almost certainly multifactorial in origin, evidence suggests that fluid overload may be the most important single factor. The volume of infusion should therefore be kept to a minimum; for further guidance see Appendix 6. For specific guidance on infusion rates, consult product literature

**Yutopar** (Dubin)
Injection, ritodrine hydrochloride 10 mg, net price 90-tab pack = £30.40

**Contra-indications**
see notes above

**Side-effects**
see notes above

**Dose**
- By intravenous infusion, initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (max. rate 45 micrograms/minute); maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours; then by mouth (but see notes above), 4 mg every 6–8 hours

**Preparations**
Section 3.1.1.1

**TERBUTALINE SULPHATE**

**Indications**
uncomplicated premature labour (see notes above); asthma (section 3.1.1)
7.2 Treatment of vaginal and vulval conditions

7.2.1 Preparations for vaginal and vulval changes

Topical HRT for vaginal atrophy

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in menopausal atrophic vaginitis. It is important to bear in mind that topical oestrogens should be used in the smallest effective amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia is increased when systemic oestrogens are administered alone for prolonged periods (section 6.4.1.1). The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

For a general comment on hormone replacement therapy, including the role of topical oestrogens, see section 6.4.1.1.

OESTROGENS, TOPICAL

Indications see notes above

Cautions see notes above; see also Oestrogens for HRT (section 6.4.1.1); interrupt treatment periodically to assess need for continued treatment

Contra-indications see notes above; see also Oestrogens for HRT (section 6.4.1.1)

7.2.2 Vaginal and vulval infections

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

Aqueous medicated douches may disturb normal vaginal acidity and bacterial flora.

Topical anaesthetic agents give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis (section 5.1).

Hepatic impairment see Combined Hormonal Contraceptives, section 7.3.1

Pregnancy see Combined Hormonal Contraceptives, section 7.3.1

Breast-feeding avoid; adverse effects on lactation; see also Combined Hormonal Contraceptives, section 7.3.1

Side-effects see notes above; see also Oestrogens for HRT (section 6.4.1.1); local irritation

Gynest® (Marlborough) (R) *Intravaginal cream, estril 0.01%, net price 80 g with applicator = £4.67 *Excipients include arachis (peanut) oil *Condoms may damage latex condoms and diaphragms *Dose insert 1 applicatorful daily, preferably in the evening until improvement occurs, reduced to 1 applicatorful twice a week; attempts to discontinue should be made at 3–6 month intervals with re-examination

Ortho-Gynest® (Janssen-Cilag) (R) *Pessaries, estril 500 micrograms, net price 15 pessaries = £4.73 *Excipients include butylated hydroxytoluene *Condoms damages latex condoms and diaphragms *Dose insert 1 pessary daily, preferably in the evening, until improvement occurs; maintenance 1 pessary twice a week; attempts to reduce or discontinue should be made at 3–6 month intervals with re-examination

Ovestin® (Organon) (R) *Intravaginal cream, estril 0.1%, net price 15 g with applicator = £4.45 *Excipients include cetyl alcohol, polysorbates, stearyl alcohol *Condoms effect on latex condoms and diaphragms not yet known *Dose insert 1 applicator–dose daily for 2–3 weeks, then reduce to twice a week (discontinue every 2–3 months for 4 weeks to assess need for further treatment); vaginal surgery, 1 applicator–dose daily for 2 weeks before surgery, resuming 2 weeks after surgery

Vagifem® (Novo Nordisk) (R) *Vaginal tablets, f /c, estradiol 10 micrograms in disposable applicators, net price 24-applicator pack = £16.72; estradiol 25 micrograms in disposable applicators, 15-applicator pack = £9.50 *Excipients none as listed in section 13.1.3 *Condoms no evidence of damage to latex condoms and diaphragms *Dose insert 1 vaginal tablet daily for 2 weeks then reduce to 1 tablet twice weekly; initiate therapy with 10 microgram vaginal tablets, increased after 3 months to 25 microgram vaginal tablet if response inadequate

Vaginal ring

Estring® (Pharmera) (R) *Vaginal ring, releasing estradiol approx. 7.5 micrograms/24 hours, net price 1-ring pack = £31.42. *Label: 10, patient information leaflet *Dose for postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis), to be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

Non-hormonal preparations for vaginal atrophy

Replens MD® and Syik® are acidic, non-hormonal vaginal moisturisers; Replens MD® provides a high moisture content for up to 3 days.
7 Obstetrics, gynaecology, and urinary-tract disorders

7.2.2 Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

*Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

**Imidazole** drugs (clotrimazole, econazole, fenticonazole, and miconazole) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with *fluconazole* or *itraconazole* (section 5.2.1) is also effective; oral ketoconazole has been associated with fatal hepatotoxicity (see section 5.2.2).

**Vulvovaginal candidiasis in pregnancy** Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

**Recurrent vulvovaginal candidiasis** Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors such as antibiotic therapy, pregnancy, diabetes mellitus and possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of re-infection and, if symptomatic, should be treated with cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis. Some recommended regimens [all unlicensed] include:

- initially, *fluconazole* (section 5.2.1) by mouth 150 mg every 72 hours for 3 doses, then 150 mg once every week for 6 months;
- initially, vaginal application of a topical imidazole for 10–14 days, then clotrimazole vaginally 500-mg pessary once every week for 6 months;
- initially, vaginal application of a topical imidazole for 10–14 days, then clotrimazole (section 5.2.1) by mouth 50–100 mg daily for 6 months.

## PREPARATIONS FOR VAGINAL AND VULVAL CANDIDIASIS

**Indications** see notes above

**Pregnancy** see notes above

**Side-effects** occasional local irritation

**Dose**

- See under preparations below

### Clotrimazole (Non-proprietary)

- **Cream** (topical), clotrimazole 1%, net price 20 g = £1.52, 50 g = £4.12
- **Condoms** check with manufacturer of cream for effect on latex condoms and diaphragms
- **Dose** apply to anogenital area 2–3 times daily
- **Pessary**, clotrimazole 500 mg, net price 1 pessary with applicator = £3.13
- **Dose** insert 1 pessary at night as a single dose; can be repeated once if necessary

### Canesten® (Bayer Consumer Care)

- **Cream** (topical), clotrimazole 1%, net price 20 g = £2.14, 50 g = £3.50
- **Exipients** include benzy alcohol, cetostearyl alcohol, poloxamers
- **Condoms** damages latex condoms and diaphragms
- **Dose** apply to anogenital area 2–3 times daily
- **Thrush Cream** (topical), clotrimazole 2%, net price 20 g = £3.99
- **Exipients** include benzy alcohol, cetostearyl alcohol, poloxamers
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 5 g at night as a single dose; can be repeated once if necessary
- **Note** Brands for sale to the public include *Canesten* Internal Cream

### Cream Combi, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) and 10-g topical cream = £6.81

- **Condoms** damages latex condoms and diaphragms
- **Dose** see under individual components

### Pessaries, clotrimazole 100 mg, net price 6 pessaries with applicator = £3.63; 200 mg, 3 pessaries with applicator = £3.63

- **Exipients** include benzyl alcohol, cetostearyl alcohol, poloxamers
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 200 mg for 3 nights or 100 mg for 6 nights; course can be repeated once if necessary
- **Pessary**, clotrimazole 500 mg, net price 1 pessary with applicator = £2.00

- **Exipients** none as listed in section 13.1.3
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 1 pessary at night as a single dose; can be repeated once if necessary

### Combi, clotrimazole 500-mg pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £5.21

- **Condoms** damages latex condoms and diaphragms
- **Dose** see under individual components

### Gyno-Daktarin® (Janssen-Cilag)

- **Intravaginal cream**, miconazole nitrate 2%, net price 78 g with applicator = £4.33

- **Exipients** include butylated hydroxyanisole
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 5-g applicatorful once daily for 10–14 days or twice daily for 7 days; course can be repeated once if necessary; topical, apply to anogenital area twice daily
7.3 Contraceptives

The antiviral drugs aciclovir, famiclovir, and valaciclovir can be used in the treatment of genital infection due to herpes simplex virus, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms. See section 5.3.2.1 for systemic preparations, and section 13.10.3 for topical preparations.

PREPARATIONS FOR OTHER VAGINAL INFECTIONS

Dalacin® (Pharmacia) 
Cream, clindamycin 2% (as phosphate), net price 40-g pack with 7 applicators = £10.86
Excipients include benzyl alcohol, cetoconazol alcohol, polysorbates, propylene glycol
Condoms damages latex condoms and diaphragms
Side-effects irritation, cervicitis, and vaginitis; poorly absorbed into the blood—low risk of systemic effects, see section 5.1.6
Dose bacterial vaginosis, insert 5-g applicatorful at night for 3–7 nights

Zidoval® (Meda)
Vaginal gel, metronidazole 0.75%, net price 40-g pack with 5 applicators = £4.31
Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol
Cautions not recommended during menstruation; some absorption may occur, see section 5.1.11 for systemic effects
Side-effects local effects including irritation, candidiasis, abnormal discharge, pelvic discomfort
Dose bacterial vaginosis, insert 5-g applicatorful at night for 5 nights

Relactagel® (KoRa)
Vaginal gel, lactic acid 4.5%, glycolgen 0.1%, net price 7 × 5 mL-tube = £5.25
Excipients include propylene glycol
Cautions not recommended if trying to conceive
Side-effects mild irritation
Dose prevention of bacterial vaginosis, ADULT over 18 years insert contents of 1 tube at right for 2–3 nights after menstruation

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole or tinidazole (section 5.1.11).

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially Bacteroides spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

BNF 61

7.3 Contraceptives

The Fraser Guidelines1 should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irre-
7.3.1 Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’, those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Choice. The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol valerate are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen.

- Low strength preparations (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable. It is recommended that the combined oral contraceptive is not continued beyond 50 years of age since more suitable alternatives exist.
- Standard strength preparations (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phased preparations) are appropriate for standard use—but see Risk of Venous Thromboembolism below. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens desogestrel, drospirenone, and gestodene (in combination with ethinylestradiol) may be considered for women who have side-effects (such as acne, headache, depression, weight gain, breast symptoms, and breakthrough bleeding) with other progestogens. However, women should be advised that desogestrel and gestodene have also been associated with an increased risk of venous thromboembolism. Drospirenone, a derivative of spironolactone, has antiandrogenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (Evra®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (NuvaRing®).

Risk of venous thromboembolism. There is an increased risk of venous thromboembolic disease (particularly during the first year) in users of oral contraceptives, but this risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors for venous thromboembolism, such as obesity.

The incidence of venous thromboembolism in healthy, non-pregnant women who are not taking an oral contraceptive is about 5–10 cases per 100 000 women per year. For those using combined oral contraceptives containing second-generation progestogens, such as levonorgestrel, this incidence is about 15 per 100 000 women per year of use. The risk of venous thromboembolism with transdermal patches may be slightly increased compared with combined oral contraceptives that contain levonorgestrel. Some studies have reported a greater risk of venous thromboembolism in women using combined oral contraceptives containing the third-generation progestogens desogestrel and gestodene; the incidence in these women is about 25 per 100 000 women per year of use. The absolute risk of venous thromboembolism in women using combined oral contraceptives containing these third-generation progestogens is very small and well below the risk associated with pregnancy. The risk of venous thromboembolism in women using a combined oral contraceptive containing drospirenone may be between that associated with combined oral contraceptives containing second-generation progestogens and those containing third-generation progestogens. The risk of venous thromboembolism associated with vaginal ring use compared to the risk with other combined hormonal contraceptives is unknown.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Travel. Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep-vein thrombosis during travel involving long periods of immobility (over 5 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed pill. The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late; for women taking Qlaira®, see below. If a woman misses only one pill, she should take an active pill as soon as
she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets).

A missed pill for a woman taking Qlaira® is one that is 12 hours or more late; for information on how to manage missed pills in women taking 12 hours or more late; for information on how to manage missed pills in women taking Qlaira®, refer to product literature.

Emergency contraception (section 7.3.5) is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet. Note: The Faculty of Sexual and Reproductive Healthcare offers 2 different types of missed pill advice depending on the ethinylestradiol content of the contraceptive pill. The missed pill information above offers the same advice regardless of the ethinylestradiol content of the contraceptive pill, it is a simplified, more cautious version of advice issued by the Faculty of Sexual and Reproductive Healthcare.

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If intercourse has occurred during this extended patch-free interval, a possibility of fertilisation should be considered. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch ‘change day’ remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual ‘change day’, the day after day 28; no additional contraception is required.

Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days (9 days for Qlaira®) after recovery (see also under Missed pill, above). If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Interactions The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives (section 7.3.2.1), contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine, eslicarbazepine, modafinil, nelfinavir, nevirapine, oxicarbazepine, phenytoin, phenobarbital, primidone, ritonavir, St John’s Wort, topiramate, and, above all, rifabutin and rifampicin). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

For a short course of an enzyme-inducing drug, the dose of combined oral contraceptives should be adjusted to provide ethinylestradiol 50 micrograms or more daily (unlicensed use); furthermore, additional contraceptive precautions should be taken whilst taking the enzyme-inducing drug and for 4 weeks after stopping it. Additional contraceptive precautions are also required for women using contraceptive patches and vaginal rings whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs
beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately without a patch-free or ring-free break.

Women requiring a long-term course of an enzyme-inducing drug should be encouraged to consider a contraceptive method that is unaffected by the interacting drug. In women unable to use an alternative method of contraception (for rifampicin and rifabutin see also below), a regimen of combined oral contraceptives should be taken which provides a daily intake of ethinyloestradiol 50 micrograms or more [unlicensed use]; ‘tricycling’ (i.e. taking 3 or 4 packets of monophasic tablets without a break followed by a short tablet-free interval of 4 days) may be recommended. Rifampicin and rifabutin are such potent enzyme-inducing drugs that an alternative method of contraception (such as an IUD) is always recommended. Since enzyme activity does not return to normal for several weeks after stopping an enzyme-inducing drug, appropriate contraceptive measures are required for 4 to 8 weeks after stopping. Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

In the past there have been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin, doxycycline) reduce the efficacy of combined oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction. Current recommendations are that no additional contraceptive precautions are required when combined oral contraceptives are used with antibacterials that do not induce liver enzymes.

Surgery Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb should preferably be discontinued at the first menses occurring at least 2 weeks after full mobilisation. A progesteron-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation, as above. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment) if, of any of the following occur:
- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment (see Cautions and Contra-indications under Combined Hormonal Contraceptives below or under Oestrogens for HRT (section 6.4.1.1)).

COMBINED HORMONAL CONTRACEPTIVES

Indications contraception; menstrual symptoms (section 6.4.1.2)

Cautions see notes above; risk factors for venous thromboembolism (see below and also notes above), arterial disease and migraine, see below; personal or family history of hypertriglyceridaemia (increased risk of pancreatitis); hyperprolactinaemia (seek specialist advice); history of severe depression especially if induced by hormonal contraceptive; undiagnosed breast mass; gene mutations associated with breast cancer (e.g. BRCA 1); sickle-cell disease; inflammatory bowel disease including Crohn’s disease; reduced efficacy of contraceptive patch in women with body-weight > 90 kg; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; interactions: see above and Appendix 1 (oestrogens, progestogens)

Risk factors for venous thromboembolism See also notes above. Use with caution if any of the following factors present but avoid if two or more factors present:
- family history of venous thromboembolism in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- obesity—body mass index > 30 kg/m² (avoid if body mass index > 35 kg/m² unless no suitable alternative);
- long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- history of superficial thrombophlebitis;
- age over 35 years (avoid if over 50 years);
- smoking.

Risk factors for arterial disease Use with caution if any of the following factors present but avoid if two or more factors present:
- family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- diabetes mellitus (avoid if diabetes complications present);
- hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg);
- smoking (avoid if smoking 40 or more cigarettes daily);
- age over 35 years (avoid if over 50 years);
- obesity (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative).
By mouth

Side-effects avoid until weaning or for 6 months Breast-feeding not known to be harmful Pregnancy Hepatic impairment avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours

Contra-indications see notes above; personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus; sclerosing treatment for varicose veins; migraine with aura (see also above); transient cerebral ischaemic attacks without headaches; systemic lupus erythematosus with (or unknown) antiphospholipid antibodies; acute porphyria (section 9.8.2); gallstones; history of haemolytic uraemic syndrome or history during pregnancy of pruritus, cholestatic jaundice, chorea, pemphigoid gestationis; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour—see also Reason To Stop Immediately in notes above)

Contra-indications see notes above; personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus; sclerosing treatment for varicose veins; migraine with aura (see also above); transient cerebral ischaemic attacks without headaches; systemic lupus erythematosus with (or unknown) antiphospholipid antibodies; acute porphyria (section 9.8.2); gallstones; history of haemolytic uraemic syndrome or history during pregnancy of pruritus, cholestatic jaundice, chorea, pemphigoid gestationis; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding

Hepatic impairment avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours

Pregnancy not known to be harmful

Breast-feeding avoid until weaning or for 6 months after birth (adverse effects on lactation)

Side-effects see notes above; also nausea, vomiting, abdominal cramps, changes in body-weight, liver impairment, hepatic tumours; fluid retention, thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB; see also notes above), hypertension, changes in lipid metabolism; headache, depression, chorea, nervousness, irritability; changes in libido, breast tenderness, changes in lipid metabolism (e.g. Dubin-Johnson or Rotor syndromes); seizures; leg cramps; skin reactions; risk of varicose veins; migraine treated with ergot derivatives)
traceptive used correctly and pregnancy unlikely, can switch to ring on any day of cycle. 

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed, from an injection, insert ring when next injection due, from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After first trimester abortion Start immediately.

After childbirth (not breast-feeding) or second trimester abortion Start 4 weeks after birth or abortion; if started later than 4 weeks after birth or abortion, additional precautions (barrier methods) should be used for first 7 days.

Oral (low and standard strength)
For information on these preparations, see Combined Oral Contraceptives table, below.

---

**Combined Oral Contraceptives**

See Risk of Venous Thromboembolism in notes above before prescribing.

**Ethinylestradiol with Norelgestromin**

See Risk of Venous Thromboembolism in notes above before prescribing.

**Evra** (Janssen-Cilag) Patches, self-adhesive (releasing ethinylestradiol approx. 33.9 micrograms/24 hours and norelgestromin approx. 203 micrograms/24 hours); net price 9-patch pack = £16.70. Counselling, administration Dose 1 patch to be applied once weekly for three weeks, followed by a 7-day patch-free interval; subsequent courses repeated after 7-day patch-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above. Note Adhesives or bandages should not be used to hold patch in place. If patch no longer sticky do not reapply but use a new patch.

**Evra** patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

---

**Transdermal (standard strength)**

</table>

1. Dose: 1 tablet daily for 28 days, starting on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting routines see under Dose above.

2. Dose: 1 tablet daily for 21 days starting on day 1 of cycle; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above.
7 Obstetrics, gynaecology, and urinary-tract disorders

Vaginal (low strength)

*Ethinylestradiol with Etonogestrel*

See Risk of Venous Thromboembolism in notes above before prescribing

**Nuvaring® (Organon)**

**Vaginal ring**, releasing ethinylestradiol approx. 15 micrograms/24 hours and etonogestrel approx. 120 micrograms/24 hours, net price 3-ring pack = £27.00.

**Counselling, administration**

**Dose** 1 ring to be inserted into the vagina, removed on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above.

**Counselling** The presence of the ring should be checked regularly. In case of expulsion see Expulsion, Delayed Insertion or Removal, or Broken Vaginal Ring, p. 495

### 7.3.2 Progestogen-only contraceptives

#### 7.3.2.1 Oral progestogen-only contraceptives

Oral progestogen-only preparations may offer a suitable alternative when oestrogens are contra-indicated (including those patients with venous thrombosis or a past history or predisposition to venous thrombosis), but may have a higher failure rate than combined preparations. They are suitable for older women, for heavy smokers, and for those with hypertension, valvular heart disease, diabetes mellitus, and migraine. Menstrual irregularities (oligomenorrhoea, menorrhagia) are more common but tend to resolve on long-term treatment.

**Interactions** Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an additional or alternative contraceptive method is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards—see p. 495 and Appendix 1 (progestogens).

**Surgery** All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined oral contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

**Starting routine** One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours (12 hours for Cerazette®) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.)

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception (see p. 505) if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for Cerazette®) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

**Diarrhoea and vomiting** Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours (12 hours for Cerazette®) of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery (see also under Missed pill above).

#### 7.3.2.2 Parenteral progestogen-only contraceptives

#### 7.3.2.3 Intra-uterine progestogen-only device

**ORAL PROGESTOGEN-ONLY CONTRACEPTIVES**

**(Progestogen-only pill, ‘POP’)**

**Indications** contraception

**Cautions** arterial disease; sex-steroid dependent cancer; past ectopic pregnancy; malabsorption syndromes; active thrombophilic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies; functional ovarian cysts; past ectopic pregnancy; malabsorption syndrome

**Other conditions** The product literature advises caution in patients with history of venous thromboembolism, hypertension, diabetes mellitus and migraine, evidence for caution in these conditions is unsatisfactory

**Contra-indications** undiagnosed vaginal bleeding; severe arterial disease; acute porphyria (section 9.8.2); history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

**Hepatic impairment** caution in severe liver disease and recurrent cholestatic jaundice; avoid in liver tumour

**Pregnancy** not known to be harmful

**Breast-feeding** progestogen-only contraceptives do not affect lactation; see also After Childbirth above

**Side-effects** menstrual irregularities (see also notes above); nausea, vomiting, headache, dizziness, breast discomfort, depression, skin disorders, disturbance of appetite, weight changes, changes in libido

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have
recently used, a progestogen-only contraceptive pill, this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

**Dose**
- 1 tablet daily at same time each day, starting on day 1 of cycle then continuously; if administration delayed for 3 hours (12 hours for Cerazette®) or more it should be regarded as a ‘missed pill’, see notes above

Cerazette® (Organon) (©)
- Tablets, P/c, desogestrel 75 micrograms, net price 3 × 28-tab pack = £8.68
- The Scottish Medicines Consortium has advised (September 2003) that Cerazette® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated

Femulen® (Pharmacia) (©)
- Tablets, etynodiol diacetate 500 micrograms, net price 3 × 28-tab pack = £3.31

Micronor® (Janssen-Cilag) (©)
- Tablets, norethisterone 350 micrograms, net price 3 × 28-tab pack = £1.96

Norgeston® (Bayer Schering) (©)
- Tablets, s/c, levonorgestrel 30 micrograms, net price 35-tab pack = £2.92

Noriday® (Pharmacia) (©)
- Tablets, norethisterone 350 micrograms, net price 3 × 28-tab pack = £2.10

**7.3.2.2 Parenteral progestogen-only contraceptives**

**Medroxyprogesterone acetate (Depo-Provera®)** is a long-acting progestogen given by intramuscular injection; it is as effective as the combined oral preparations but because of its prolonged action it should never be used without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Heavy bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of heavy or prolonged bleeding may be increased). The manufacturer advises that in heavier women, blood medroxyprogesterone concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant. The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

**Implanon®,** also an etonogestrel-releasing implant, has been discontinued (October 2010), but some women may have the implant in place until 2013. The cautions, contra-indications, and side-effects of oral progestogen-only contraceptives apply to parenteral progestogen-only contraceptives, except that parenteral preparations reliably inhibit ovulation and therefore protect against ectopic pregnancy and functional ovarian cysts.

**Interactions** Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. However, effectiveness of norethisterone and etonogestrel (but not depot medroxyprogesterone acetate) may be reduced by enzyme-inducing drugs; additional contraceptive precautions should be taken whilst taking the enzyme-inducing drug and for 4 weeks after stopping it or an alternative contraceptive method should be considered if long-term use of the enzyme-inducing drug is contemplated.

**Indications** contraception, see also notes above and under preparations (roles vary according to preparation)

**Cautions** see notes above and under preparations; possible risk of breast cancer, see oral progestogen-only contraceptives (section 7.3.2.1); history during pregnancy of pruritus or of deterioration of oto-
sclerosis, disturbances of lipid metabolism; interactions: see notes above and Appendix 1 (progestogens)

Counselling Full counselling backed by patient information leaflet required before administration

Contra-indications see notes above; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

Hepatic impairment see Oral Progestogen-only Contraceptives, section 7.3.2.1

Pregnancy not known to be harmful; for Implanon® or Nexplanon® if pregnancy occurs remove implant

Breast-feeding progestogen-only contraceptives do not affect lactation; see also notes above and under preparations

Side-effects see notes above; injection-site reactions

Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives, see p. 496. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Dose

See under preparations

Injectable preparations

Depo-Provera® (Pfizer) Injection (aqueous suspension), medroxyprogesterone acetate 150 mg/mL, net price 1-mL prefilled syringe = £6.01, 1-mL vial = £5.01. Counselling, see patient information leaflet

Dose by deep intramuscular injection, 150 mg within first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding), for long-term contraception, repeated every 12 weeks (if interval greater than 12 weeks and 5 days, rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection)

Noristerat® (Bayer Schering) Injection (oily), norethisterone enantate 200 mg/mL, net price 1-mL amp = £3.38. Counselling, see patient information leaflet

Dose by deep intramuscular injection given very slowly into gluteal muscle, short-term contraception, 200 mg within first 5 days of cycle or immediately after parturition (duration 8 weeks); may be repeated once after 8 weeks (withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment)

Implants

Nexplanon® (Organon) Implant, containing etonorgestrel 68 mg in radiopaque flexible rod, net price = £79.46. Counselling, see patient information leaflet

Dose by subdermal implantation, no hormonal contraceptive use in previous month, 1 implant inserted during first 5 days of cycle; postpartum, 1 implant inserted 21–28 days after delivery, in breast-feeding mothers, 1 implant inserted after 28 days postpartum; abortion or miscarriage in the second trimester, 1 implant inserted 21–28 days after abortion or miscarriage; abortion or miscarriage in first trimester, 1 implant inserted within 5 days; changing from other hormonal contraceptive, consult product literature; remove implant within 3 years of insertion

replacement therapy. This may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time (section 6.4.1.2).

Cautions and contra-indications Generally the cautions and contra-indications for the progestogen-only intra-uterine system are as for standard intra-uterine devices (section 7.3.4), but the risk of ectopic pregnancy is considerably smaller. Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Since levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

Side-effects Initially, changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) are common; endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern usually occurs a few months after insertion and bleeding may often become very light or absent. Functional ovarian cysts (usually asymptomatic) can occur and usually resolve spontaneously (ultrasound monitoring recommended).

INTRA-UTERINE PROGESTOGEN-ONLY SYSTEM

Indications see under preparation

Cautions see notes above; history of depression; advanced uterine atrophy; systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies; not suitable for emergency contraception; interactions: see notes above and Appendix 1 (progestogens)

7.3.2.3 Intra-uterine progestogen-only device

The progestogen-only intra-uterine system, Mirena®, releases levonorgestrel directly into the uterine cavity. It is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. This may therefore be a contraceptive method of choice for women who have excessively heavy menses.
Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished (section 6.4.1.1). They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Gygel® (Marlborough)

Dose
- See under preparation

Mirena® (Bayer Schering) (NW)

Intra-uterine system, T-shaped plastic frame (impregnated with barium sulphate and with threads attached to base) with polydimethylsiloxane reservoir releasing levonorgestrel 20 micrograms/24 hours, net price = £85.66. Counselling, see patient information leaflet

Dose contraception and menorrhagia, insert into uterine cavity within 7 days of onset of menstruation or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years.

Prevention of endometrial hyperplasia during oestrogen replacement therapy, insert during last days of menstruation or withdrawal bleeding or any time if amenorrhoeic; effective for 4 years.

Note When system is removed (and not immediately replaced), if pregnancy is not desired, remove during the first few days of the onset of menstruation, otherwise additional contraceptive measures should be used for at least 7 days before removal.

7.3.3 Spermicidal contraceptives

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease (see below). The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms.

Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper. Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (GyneFix®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus. The intra-uterine devices Multiload® Cu250 and Multiload® Cu250 Short (Organon) have been discontinued, but some women may have the devices in place until 2011.

The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation. The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
- they are under 25 years old
- they are over 25 years old and
  - have a new partner or
  - have had more than one partner in the past year or
  - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for...
the previous 7 days. If removal is essential post-coital contraception should be considered.

If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible.

**INTRA-UTERINE CONTRACEPTIVE DEVICES**

**Indications** see notes above

**Cautions** see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression); epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution; gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to see doctor promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible).

**Intra-implants** severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration), pelvic inflammatory disease, established or marked immunosuppression, copper devices: copper allergy, Wilson’s disease, medical diarrhoea

**Pregnancy** remove device; if pregnancy occurs, increased likelihood that it may be ectopic

**Breast-feeding** not known to be harmful

**Side-effects** uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; on insertion: pain (allayed by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack

**Cu-Safe** T300 (Williams) 
*Intra-uterine device*, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.11

For uterine length over 5 cm, replacement every 5 years (see notes above)

**Flexi-T** 300 (Durbin) 
*Intra-uterine device*, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47

For uterine length over 5 cm, replacement every 5 years (see notes above)

**Flexi-T** + 380 (Durbin) 
*Intra-uterine device*, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £10.06

For uterine length over 6 cm, replacement every 5 years (see notes above)

**GyneFix** (Williams) 
*Intra-uterine device*, 6 copper sleeves with surface area of 330 mm² on polypropylene thread, net price = £26.64

Suitable for all uterine sizes; replacement every 5 years

**Load** 375 (Durbin) 
*Intra-uterine device*, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.52

For uterine length over 7 cm, replacement every 5 years (see notes above)

**Mini TT 380® Slimline** (Durbin) 
*Intra-uterine device*, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46

For minimum uterine length 5 cm, replacement every 5 years (see notes above)

**Multiload® Cu375** (Organon) 
*Intra-uterine device*, as Load 375, with copper surface area approx. 375 mm² and vertical stem length 3.5 cm, net price = £9.24

For uterine length 6-9 cm, replacement every 5 years (see notes above)

**Multi-Safe® 375** (Williams) 
*Intra-uterine device*, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80

For uterine length over 6-9 cm, replacement every 5 years (see notes above)

**Multi-Safe® 375 Short Stem** (Williams) 
*Intra-uterine device*, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80

For uterine length 5-7 cm, replacement every 5 years (see notes above)

**Neo-Safe® T380** (Williams) 
*Intra-uterine device*, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £13.80

For uterine length 6.5-9 cm, replacement every 5 years (see notes above)

**Nova-T® 380** (Bayer Schering) 
*Intra-uterine device*, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £11.97

For uterine length 6.5-9 cm, replacement every 5 years (see notes above)

**T-Safe® 380A QuickLoad** (Williams) 
*Intra-uterine device*, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar on the distal portion of each arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, quick-loading system, net price = £10.29, also available with a capsule loading device (T-Safe® 380A Capped JM), net price = £10.29

For uterine length 6.5-9 cm, replacement every 10 years (see notes above)

**TT 380® Slimline** (Durbin) 
*Intra-uterine device*, copper wire, wound on vertical stem of T-shaped plastic carrier, with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46

For uterine length 6-9 cm, replacement every 5 years (see notes above)
radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

UT 380 Short® (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

UT 380 Standard® (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Other contraceptive devices

Rubber contraceptive caps
Type A Contraceptive Pessary
Opaque rubber, sizes 1 (50 mm), 2 (55 mm), 3 (60 mm), 4 (65 mm), 5 (75 mm), net price = £6.85

Type B Contraceptive Pessary
Opaque rubber, sizes 22 to 31 mm (rising in steps of 3 mm), net price = £8.46

Type C Contraceptive Pessary
Opaque rubber, sizes 1 to 3 (42, 48, and 54 mm), net price = £7.26

Silicone contraceptive caps
Silicone Contraceptive Pessary
Silicone, sizes 22, 26, and 30 mm, net price = £15.00
Brands include FemCap®

Rubber contraceptive diaphragms
Type A Diaphragm with Flat Metal Spring
Transparent rubber with flat metal spring, sizes 55–95 mm (rising in steps of 5 mm), net price = £5.78
Brands include Reflexicon®

Type B Diaphragm with Coiled Metal Spring
Opaque rubber with coiled metal spring, sizes 60–100 mm (rising in steps of 5 mm), net price = £8.79

Type C Arcing Spring Diaphragm
Opaque rubber with arcing spring, sizes 60–95 mm (rising in steps of 5 mm), net price = £7.72

Silicone contraceptive diaphragms
Type B Diaphragm with Coiled Metal Spring
Silicone with coiled metal spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35
Brands include Milex Omunix®

Type C Arcing Spring Diaphragm
Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35
Brands include Miles Arcing Style®, Ortho All-flex®

7.3.5 Emergency contraception

Hormonal methods
Hormonal emergency contraceptives include levonorgestrel and ulipristal; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 120 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device (see below). Ulipristal is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

If vomiting occurs within 2 hours of taking levonorgestrel or within 3 hours of taking ulipristal, a replacement dose should be given. If an antiemetic is required domperidone is preferred.

When prescribing hormonal emergency contraception the doctor should explain:
- that the next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- the need to return promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy (and also in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned).

Interactions
The effectiveness of levonorgestrel, and possibly ulipristal, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead or the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers.

LEVONORGESTREL

Indications emergency contraception

Cautions
see notes above; past ectopic pregnancy; severe malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; interactions: see notes above and Appendix 1 (progestogens)

Contra-indications
acute porphyria (section 9.8.2)
Pregnancy not known to be harmful
Breast-feeding progestogen-only contraceptives do not affect lactation

Side-effects menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting

Dose
- 1.5 mg as a single dose as soon as possible after coitus (preferably within 12 hours but no later than after 72 hours)

1. Levonelle® One Step (Bayer Schering)
Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

1. Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society of Great Britain

Levonelle® 1500 (Bayer Schering) Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £5.20

---

radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

UT 380 Short® (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

UT 380 Standard® (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Other contraceptive devices

Hormonal methods
Hormonal emergency contraceptives include levonorgestrel and ulipristal; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 120 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device (see below). Ulipristal is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

If vomiting occurs within 2 hours of taking levonorgestrel or within 3 hours of taking ulipristal, a replacement dose should be given. If an antiemetic is required domperidone is preferred.

When prescribing hormonal emergency contraception the doctor should explain:
- that the next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- the need to return promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy (and also in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned).

Interactions
The effectiveness of levonorgestrel, and possibly ulipristal, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead or the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers.

LEVONORGESTREL

Indications emergency contraception

Cautions
see notes above; past ectopic pregnancy; severe malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; interactions: see notes above and Appendix 1 (progestogens)

Contra-indications
acute porphyria (section 9.8.2)
Pregnancy not known to be harmful
Breast-feeding progestogen-only contraceptives do not affect lactation

Side-effects menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting

Dose
- 1.5 mg as a single dose as soon as possible after coitus (preferably within 12 hours but no later than after 72 hours)

1. Levonelle® One Step (Bayer Schering)
Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

1. Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society of Great Britain

Levonelle® 1500 (Bayer Schering) Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £5.20
7 Obstetrics, gynaecology, and urinary-tract disorders

7.1.13. For drugs used in the treatment of urinary-tract infections see section 5.1.13.

Drug for genito-urinary disorders

7.4 Drugs for genito-urinary disorders

7.4.1 Drugs for urinary retention

**ULIPRISTAL ACETATE**

**Indications** emergency contraception

**Cautions** see notes above; uncontrolled severe asthma; effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required; repeated use within a menstrual cycle; **interactions:** see notes above and Appendix 1 (ulipristal)

**Hepatic impairment** manufacturer advises avoid in severe impairment—no information available

**Pregnancy** limited information available

**Breast-feeding** manufacturer advises avoid for at least 36 hours—no information available

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, and abdominal pain); dizziness, fatigue, headache; menstrual irregularities (see notes above); back pain, muscle spasms; less commonly tremor, hot flushes, uterine spasm, breast tenderness, dry mouth, blurred vision, pruritus, and rash

**Dose**

- 30 mg as a single dose as soon as possible after coitus, but no later than after 120 hours

** ellaOne® (HRA Pharma)**

- Tablets, ulipristal acetate 30 mg, net price 1-tab pack £16.95

**Intra-uterine device**

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device (section 7.3.4) can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin 1 g as a single dose). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

**Alpha-blockers**

The alpha1-selective alpha blockers, alfuzosin, doxazosin, indoramin, prazosin, tamsulosin and terazosin relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

**Cautions** Since alpha1-selective alpha blockers reduce blood pressure, patients receiving antihypertensive treatment may require reduced dosage and specialist supervision. Caution is required in the elderly and in patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome). For **interactions**, see Appendix 1 (alpha-blockers).

**Contra-indications** Alpha-blockers should be avoided in patients with a history of postural hypotension and micturition syncope.

**Side-effects** Side-effects of alpha1-selective alpha blockers include drowsiness, hypotension (notably postural hypotension), syncope, asthenia, dizziness, depression, headache, dry mouth, gastro-intestinal disturbances, oedema, blurred vision, intra-operative floppy iris syndrome (most strongly associated with tamsulosin), rhinitis, erectile disorders (including priapism), tachycardia, and palpitations. Hypersensitivity reactions including rash, pruritus and angioedema have also been reported.

**ALFUZOSIN HYDROCHLORIDE**

**Indications** benign prostatic hyperplasia

**Cautions** see notes above; discontinue if angina worsens

**Driving** May affect performance of skilled tasks e.g. driving

**Contra-indications** see notes above

**Hepatic impairment** initial dose 2.5 mg once daily, adjusted according to response to 2.5 mg twice daily in mild to moderate impairment—avoid if severe; avoid modified-release preparations

**Renal impairment** initial dose 2.5 mg twice daily and adjust according to response; manufacturers advise use modified-release preparations with caution in severe impairment as limited experience

**Side-effects** see notes above; also less commonly flushes and chest pain; also reported liver damage and cholestasis
**DOXAZOSIN**

**Indications**  
benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions**  
see notes above and section 2.5.4

**Side-effects**  
see notes above and section 2.5.4

**Dose**  
- Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

**Preparations**  
Section 2.5.4

---

**INDORAMIN**

**Indications**  
benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions**  
see notes above and section 2.5.4

**Contra-indications**  
see notes above and section 2.5.4

**Hepatic impairment**  
section 2.5.4

**Renal impairment**  
section 2.5.4

**Side-effects**  
see notes above and section 2.5.4

**Dose**  
- Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

**Preparations**  
Section 2.5.4

---

**TAMSULOSIN HYDROCHLORIDE**

**Indications**  
benign prostatic hyperplasia

**Cautions**  
see notes above

**Driving**  
May affect performance of skilled tasks e.g. driving

**Contra-indications**  
see notes above

**Hepatic impairment**  
avoid in severe impairment

**Renal impairment**  
use with caution if eGFR less than 30 mL/minute/1.73 m²

**Side-effects**  
see notes above

**Dose**  
- Initially 1 mg daily; dose may be increased if necessary by 1 mg every 2 weeks (max. 8 mg daily)

**Preparations**  
Section 2.5.4

---

For prescribing information on dutasteride, see section 6.4.2

**With dutasteride**

For prescribing information on dutasteride, see section 6.4.2

**Flomaxtra® XL** (Astellas)

**Indications**  
benign prostatic hyperplasia; hypertension, congestive heart failure and Raynaud’s syndrome (section 2.5.4)

**Cautions**  
see notes above

**Contra-indications**  
see notes above

**Hepatic impairment**  
section 2.5.4

**Renal impairment**  
section 2.5.4

**Side-effects**  
see notes above and section 2.5.4

**Dose**  
- Initially 500 micrograms twice daily for 3–7 days, subsequently adjusted according to response; usual maintenance (and max.) 2 mg twice daily; ELDERLY initiate with lowest possible dose

**Preparations**  
Section 2.5.4

---

**DOXAZOSIN**

**Indications**  
benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions**  
see notes above and section 2.5.4

**Contra-indications**  
see notes above

**Hepatic impairment**  
section 2.5.4

**Side-effects**  
see notes above and section 2.5.4

**Dose**  
- Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

**Preparations**  
Section 2.5.4

---

**INDORAMIN**

**Indications**  
benign prostatic hyperplasia; hypertension (section 2.5.4)

**Cautions**  
see notes above and section 2.5.4

**Contra-indications**  
see notes above and section 2.5.4

**Hepatic impairment**  
section 2.5.4

**Renal impairment**  
section 2.5.4

**Side-effects**  
see notes above and section 2.5.4

---

**Dose**  
- 20 mg twice daily; increased if necessary by 20 mg every 2 weeks to max. 100 mg daily in divided doses; ELDERLY; 20 mg at night may be adequate

**Doralese®** (Chemidex)

**Indications**  
benign prostatic hyperplasia

**Cautions**  
see notes above and section 2.5.4

**Contra-indications**  
see notes above and section 2.5.4

**Hepatic impairment**  
section 2.5.4

**Renal impairment**  
section 2.5.4

**Side-effects**  
see notes above and section 2.5.4

**Dose**  
- Initially 500 micrograms twice daily for 3–7 days, subsequently adjusted according to response; usual maintenance (and max.) 2 mg twice daily; ELDERLY initiate with lowest possible dose

**Preparations**

**Preparations**  
Section 2.5.4
7.4.2 Drugs for urinary frequency, enuresis, and incontinence

**TeraZosin**

- **Indications**: benign prostatic hyperplasia; hypertension (section 2.5.4)
- **Cautions**: see notes above and section 2.5.4
- **Driving**: May affect performance of skilled tasks e.g. driving
- **Contra-indications**: see notes above
- **Side-effects**: see notes above and section 2.5.4
- **Dose**: Initially 1 mg at bedtime; if necessary dose may be doubled at intervals of 1–2 weeks according to response, up to max. 10 mg once daily; usual maintenance 5–10 mg daily
- **First dose effect**: First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

- **Terazosin** (Non-proprietary)
  - **Tablets**: terazosin (as hydrochloride) 2 mg, net price 28-tab pack = £2.16; 5 mg, 28-tab pack = £2.58; 10 mg, 28-tab pack = £7.88. Counselling, initial dose, driving advice available

**Distigmine Bromide**

- **Indications**: postoperative urinary retention (see notes above), neurogenic bladder; myasthenia gravis (section 10.2.1)
- **Cautions**: peptic ulcer; conditions where increased motility of the urinary or gastro-intestinal tract could be harmful; oesophagitis; cardiovascular disease; bronchospasm; epilepsy; parkinsonism; **interactions**: Appendix 1 (parasympathomimetics)
- **Contra-indications**: intestinal or urinary obstruction; severe circulatory insufficiency; asthma
- **Pregnancy**: manufacturer advises avoid (may stimulate uterine contractions)
- **Breast-feeding**: manufacturer advises avoid—no information available
- **Side-effects**: abdominal pain, diarrhoea, increased salivation; bradycardia, AV block, hypotension; dyspnoea; muscle twitching; increased lacrimation, miosis; increased sweating
- **Dose**: Urinary retention, 5 mg daily, half an hour before breakfast
- **Neurogenic bladder, 5 mg daily, half an hour before breakfast
- **Driving**: May affect performance of skilled tasks e.g. driving

**Parasympathomimetics**

The parasympathomimetic **bethanechol** increases detrusor muscle contraction. However, it has only a limited role in the relief of urinary retention; its use has been superseded by catheterisation.

**Distigmine** inhibits the breakdown of acetylcholine. It may help patients with an upper motor neurone neurogenic bladder.

**Bethanechol Chloride**

- **Indications**: urinary retention, but see notes above
- **Cautions**: autonomic neuropathy (use lower initial dose); **interactions**: Appendix 1 (parasympathomimetics)
- **Contra-indications**: peptic ulcer; intestinal or urinary obstruction; conditions where increased motility of the urinary or gastro-intestinal tract could be harmful; cardiovascular disorders (including recent myocardial infarction, bradycardia, and heart block); hypotension; obstructive airways disease; epilepsy; parkinsonism; hyperhydrosis
- **Pregnancy**: manufacturer advises avoid—no information available
- **Breast-feeding**: manufacturer advises avoid; gastro-intestinal disturbances in infant reported
- **Side-effects**: nausea, vomiting, diarrhoea, abdominal pain, increased salivation, eructation; flushing, hypotension, bradycardia; bronchoconstriction, rhinorrhea; headache; increased lacrimation; increased sweating
- **Dose**: 10–25 mg 3–4 times daily half an hour before food

**Myotonine** (Glenwood)

- **Tablets**: scored, bethanechol chloride 10 mg, net price 100-tab pack = £5.07; 25 mg, 100-tab pack = £6.48. Label: 22

**Duloxetine**

- **Tablets**: scored, terazosin (as hydrochloride) 2 mg (yellow) and 2 mg (blue), 28-tab pack = £8.57; starter pack = £7.88. Counselling, initial dose, driving advice available

**Urinary incontinence**

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine, an inhibitor of serotonin and noradrenaline re-uptake can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine are comparable to those of modified-release oxybutynin. Flavoxate has less marked side-effects but it is also less effective. Darifenacin, fesoterodine, propiverine,
The Scottish Medicines Consortium (p. 4) has advised that solifenacin (Toviaz®) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome. Propantheline and tricyclic antidepressants were used for severe urge incontinence but they are little used now because of their side-effects. The use of imipramine is limited by its potential to cause cardiac side-effects. Purified bovine collagen implant (Contigen®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

Cautions Antimuscarinic drugs should be used with caution in the elderly (especially if frail), in those with autonomic neuropathy, and in those susceptible to angle-closure glaucoma. They should also be used with caution in hiatus hernia with reflux oesophagitis. Antimuscarinics can worsen hyperthyroidism, coronary artery disease, congestive heart failure, hypertension, prostatic hyperplasia, arrhythmias, and tachycardia. For interactions, see Appendix 1 (antimuscarinics).

Contra-indications Antimuscarinic drugs should be avoided in patients with myasthenia gravis, significant bladder outlet obstruction or urinary retention, severe ulcerative colitis, toxic megacolon, and in gastro-intestinal obstruction or intestinal atony.

Side-effects Antimuscarinics can cause constipation, flatulence, decrease appetite, dry mouth, palpitation, and skin reactions (including dry skin, rash, and photosensitivity); also headache, diarrhoea, angioedema, arthralgias, and tachycardia. Central nervous system stimulation, such as restlessness, disorientation, hallucination, and convulsion may occur; children are at higher risk of these effects. Antimuscarinic drugs can reduce sweating, leading to heat sensations and fainting in hot environments or in patients with fever; very rarely may precipitate angle-closure glaucoma.

**DULOXETINE**

Indications moderate to severe stress urinary incontinence in women; major depressive disorder (section 4.3.4); diabetic neuropathy (section 4.3.4); generalised anxiety disorder (section 4.3.4)

Cautions elderly; cardiac disease; hypertension (avoid if uncontrolled); history of mania; history of seizures; raised intra-ocular pressure; susceptibility to angle-closure glaucoma; bleeding disorders or concomitant use of drugs that increase risk of bleeding; interactions; Appendix 1 (duloxetine)

Withdrawal Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks

Hepatic impairment manufacturer advises avoid

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy toxicity in animal studies—avoid in patients with stress urinary incontinence; risk of neonatal withdrawal symptoms if used near term

Breast-feeding present in milk—manufacturer advises avoid

Side-effects nausea, vomiting, dyspepsia, constipation, diarrhoea, abdominal pain, weight changes, decreased appetite, flatulence, dry mouth, palpitation, hot flush; insomnia, abnormal dreams, paraesthesia, drowsiness, anxiety, headache, dizziness, fatigue, weakness, tremor, nervousness, anorexia; sexual dysfunction; visual disturbances; sweating, pruritus; less commonly gastritis, hallucosis, hepatitis, bruxism, tachycardia, hypertension, postural hypotension; syncope, raised cholesterol, vertigo, taste disturbance, cold extremities, impaired temperature regulation, impaired attention, movement disorders, muscle twitching, musculoskeletal pain, thirst, stomatitis, hypothyroidism, urinary disorders, and photosensitivity; rarely mania; very rarely angle-closure glaucoma; also reported suprapontine arthrythmia, chest pain, hallucinations, suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy, p. 233), seizures, hypersensitivity reactions including urticaria, angioedema, rash (including Stevens-Johnson syndrome) and anaphylaxis, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 233)

Dose

ADULT over 18 years, 40 mg twice daily, assess for benefit and tolerability after 2–4 weeks

Note Initial dose of 20 mg twice daily for 2 weeks can minimise side-effects

**DARIFENACIN**

Indications urinary frequency, urgency, and incontinence

Cautions see notes above

Contra-indications see notes above

Hepatic impairment max. 7.5 mg daily in moderate impairment; avoid in severe impairment

Pregnancy manufacturer advises avoid— toxicity in animal studies

Breast-feeding present in milk in animal studies—manufacturer advises caution

Side-effects see notes above; also less commonly ulcerative stomatitis, oedema, hypertension, dyspnoea, cough, rhinitis, weakness, insomnia, impotence, and vaginitis

Dose

ADULT over 18 years, 7.5 mg once daily, increased if necessary after 2 weeks to 15 mg once daily

**Emselex** (Novartis) Tablets, m/r, darifenacin (as hydrobromide) 7.5 mg (white), net price 28-tab pack = £20.90; 15 mg (peach), 28-tab pack = £20.90. Label: 3, 25

**DULOXETINE**

Indications moderate to severe stress urinary incontinence in women; major depressive disorder (section 4.3.4); diabetic neuropathy (section 4.3.4); generalised anxiety disorder (section 4.3.4)

Cautions elderly; cardiac disease; hypertension (avoid if uncontrolled); history of mania; history of seizures; raised intra-ocular pressure; susceptibility to angle-closure glaucoma; bleeding disorders or concomitant use of drugs that increase risk of bleeding; interactions; Appendix 1 (duloxetine)

Withdrawal Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks

PROPANTHELINE BROMIDE

**Indications**  
adult enuresis

**Cautions**  
see notes above; ulcerative colitis

**Contra-indications**  
see notes above

**Hepatic impairment**  
manufacturer advises caution

**Renal impairment**  
manufacturer advises caution

**Pregnancy**  
manufacturer advises avoid—no information available

**Breast-feeding**  
may suppress lactation

**Side-effects**  
see notes above; also facial flushing

**Dose**
- Initially 15 mg 3 times daily at least one hour before food and 30 mg at bedtime, subsequently adjusted according to response (max. 120 mg daily)

**Preparations**
Section 1.2

**TOLTERODINE TARTRATE**

**Indications**  
see under Dose

**Cautions**  
see notes above; history of QT-interval prolongation; concomitant use with other drugs known to prolong QT interval

**Contra-indications**  
see notes above

**Hepatic impairment**  
reduce dose to 1 mg twice daily; avoid Detrusitol® XL

**Renal impairment**  
reduce dose to 1 mg twice daily if eGFR less than 30 mL/minute/1.73 m²; avoid Detrusitol® XL if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**  
manufacturer advises avoid—toxicity in animal studies

**Breast-feeding**  
manufacturer advises avoid—no information available

**Side-effects**  
see notes above; also chest pain, peripheral oedema; sinusitis, bronchitis; paraesthesia, fatigue, vertigo, weight gain; flushing also reported

**Dose**
- Urinary frequency, urgency, and incontinence, ADULT over 18 years, 2 mg twice daily; reduce to 1 mg twice daily if necessary to minimise side-effects; CHILD 2–18 years, see BNF for Children
- Nocturnal enuresis associated with overactive bladder, CHILD 7–18 years, see BNF for Children

**Detrusitol®** (Pharmacia)  
Tablets, f/c, tolterodine tartrate 1 mg, net price 56-tab pack = £29.03; 2 mg, net price 56-tab pack = £30.56. Label: 3

**Modified release**

**Detrusitol® XL** (Pharmacia)  
Capsules, blue, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £25.78. Label: 3, 25

**SOLIFENACIN SUCCINATE**

**Indications**  
urinary frequency, urgency and urge incontinence

**Cautions**  
see notes above; neurogenic bladder disorder

**Contra-indications**  
see notes above

**Hepatic impairment**  
max. 5 mg daily in moderate impairment; avoid in moderate impairment in those already taking itraconazole, ketoconazole, nelfinavir, or ritonavir; avoid in severe impairment

**Renal impairment**  
max. 5 mg daily if eGFR less than 30 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m² in those already taking itraconazole, ketoconazole, nelfinavir, or ritonavir

**Pregnancy**  
manufacturer advises caution—no information available

**Breast-feeding**  
manufacturer advises avoid—present in milk in animal studies

**Side-effects**  
see notes above; also gastro-oesophageal reflux, oedema

**Dose**
- ADULT over 18 years, 5 mg daily, increased if necessary to 10 mg once daily
- Child 2–18 years, see BNF for Children

**Kentera** (Amdipharm)  
Tablets, f/c, solifenacin succinate 5 mg (yellow), net price 30-tab pack = £27.62; 10 mg (pink), 30-tab pack = £35.91. Label: 3

**Modified release**

**Kentera® XL** (Amdipharm)  
Tablets, blue, m/r, solifenacin succinate 5 mg (yellow), net price 56-tab pack = £35.91. Label: 3

**TROSPUIM CHLORIDE**

**Indications**  
urinary frequency, urgency and incontinence

**Cautions**  
see notes above

**Contra-indications**  
see notes above
7 Obstetrics, gynaecology, and urinary-tract disorders

7.4.3 Drugs used in urological pain

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** use with caution; reduce dose to 20 mg once daily or 20 mg on alternate days if eGFR 10–30 mL/minute/1.73 m²; avoid Regurin® XL

**Pregnancy** manufacturer advises caution

**Breast-feeding** see notes above; rarely chest pain, dyspnoea, and asthenia; very rarely myalgia and arthralgia

**Dose**
- **ADULT** and **CHILD** over 12 years, 20 mg twice daily before food
- **Trospium chloride** (Non-proprietary) [®]
  - Tablets, 1/10 c, trospium chloride 20 mg, net price 60-tab pack = £18.20. Label: 23
  - Brands include Flotros®
- **Regurin**® (Speciality European) [®]
  - Tablets, brown-yellow, f/c, trospium chloride 20 mg, net price 60-tab pack = £26.00. Label: 23
- **Modified release**
  - **Regurin**® XL (Speciality European) [®]
    - Capsules, orange/white, m/r, trospium chloride 60 mg, net price 28-cap pack = £23.05. Label: 23, 25
  - **Dose** ADULT over 18 years, 60 mg once daily

**Nocturnal enuresis**

Nocturnal enuresis is common in young children, but persists in as many as 5% by 10 years of age. Treatment is not appropriate in children under 5 years and it is usually not needed in those aged under 7 years and in cases where the child and parents are not anxious about the bedwetting; however, children over 10 years usually require prompt treatment. An enuresis alarm should be first-line treatment for well-motivated, well-supported children aged over 7 years because alarms have a lower relapse rate than drug treatment when discontinued. Use of an alarm can be combined with drug therapy if either method alone is unsuccessful.

Drug therapy is not usually appropriate for children under 7 years of age; it can be used when alternative measures have failed, preferably on a short-term basis, for example to cover periods away from home, or if the child and family are anxious about the condition.

Desmopressin (section 6.5.2), an analogue of vasopressin, is used for nocturnal enuresis; it is given by oral or by sublingual administration. Particular care is needed to avoid fluid overload. Treatment should not be continued for longer than 3 months without interrupting treatment for 1 week for full re-assessment. Desmopressin should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects.

Tricyclic antidepressants (section 4.3.1) such as imipramine, and rarely amitriptyline and nortriptyline, are used but behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a full physical examination is made and the child is fully re-assessed; toxicity following overdosage with tricyclics is of particular concern.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed by antimuscarinic drugs (see Urinary incontinence, p. 508), with the addition of desmopressin if necessary.

**POTASSIUM CITRATE**

**Indications** relief of discomfort in mild urinary-tract infections; alkalinisation of urine

**Cautions** cardiac disease; elderly; interactions: Appendix 1 (potassium salts)

**Renal impairment** close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

**Side-effects** hyperkalaemia on prolonged high dosage, mild diuresis

**Dose**
- See under preparation

**Potassium Citrate Mixture BP** (Potassium Citrate Oral Solution)

- **Oral solution**, potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaja tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL. Label: 27
- **Dose** 10 mL 3 times daily well diluted with water

Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

**SODIUM BICARBONATE**

**Indications** relief of discomfort in mild urinary-tract infections; alkalinisation of urine

**Cautions** cardiac disease; patients on sodium-restricted diet; elderly; avoid prolonged use; interactions: Appendix 1 (antacids)

**Hepatic impairment** section 1.1.1

**Renal impairment** avoid; specialised role in some forms of renal disease, see section 9.2.1.3

**Pregnancy** use with caution
Side-effects  eructation, alkalosis on prolonged use

Dose  • 3 g in water every 2 hours until urinary pH exceeds 7; maintenance of alkaline urine 5–10 g daily

Preparations  Section 9.2.1.3

SODIUM CITRATE

Indications  relief of discomfort in mild urinary-tract infections

Cautions  cardiac disease; hypertension; patients on a sodium-restricted diet; elderly; interactions: Appendix 1 (sodium citrate)

Renal impairment  section 1.1.1

Pregnancy  use with caution

Side-effects  mild diuresis

Note  Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

Other preparations for urinary disorders

A terpene mixture (Rowatinex®) is claimed to be of benefit in urolithiasis for the expulsion of calculi.

Rowatinex® (Rowa)  
Capsules, yellow, e/c, anethol 4 mg, borneol 10 mg, camphene 15 mg, cineole 3 mg, fenchone 4 mg, pinene 31 mg, net price 50 = £7.35. Label: 25

Dose  1–2 capsules 3–4 times daily before food; CHILD not recommended

7.4.4 Bladder instillations and urological surgery

Bladder infection  Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine (section 13.11.2) can be used in the management of common infections of the bladder but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin 50 micrograms/mL (section 5.2.3) may be of value in mycotic infections.

Dissolution of blood clots  Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Bladder cancer  Bladder instillations of doxorubicin (section 8.1.2), mitomycin (section 8.1.2), and thiopeta (section 8.1.1) are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin (section 8.1.2) is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin (section 8.1.2) is also used for some papillary tumours.

Instillation of BCG (Bacillus Calmette-Guérin), a live attenuated strain derived from Mycobacterium bovis (section 8.2.4), is licensed for the treatment of primary or recurrent bladder carcinoma in-situ and for the prevention of recurrence following transurethral resection.

Interstitial cystitis  Dimethyl sulfoxide may be used for symptomatic relief in patients with interstitial cystitis (Hunner’s ulcer). 50 mL of a 50% solution (Rimso-50®—available from ‘special-order’ manufacturers or specialist importing companies, p. 988) is instilled into the bladder, retained for 15 minutes, and voided by the patient. Treatment is repeated at intervals of 2 weeks. Bladder spasm and hypersensitivity reactions may occur and long-term use requires ophthalmic, renal, and hepatic assessment at intervals of 6 months. Interactions: see Appendix 1 (dimethyl sulfoxide).

SODIUM CITRATE

Indications  bladder washouts, see notes above

Sterile Sodium Citrate Solution for Bladder Irrigation  sodium citrate 3%, dilute hydrochloric acid 0.2%, in purified water, freshly boiled and cooled, and sterilised

Urological surgery

There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract; if this occurs in excess, hypervolaemia, haemolysis, and renal failure may result. Glycine irrigation solution 1.5% is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

GLYCINE

Indications  bladder irrigation during urological surgery; see notes above

Cautions  see notes above

Side-effects  see notes above

Glycine Irrigation Solution (Non-proprietary)

Irrigation solution, glycine 1.5% in water for injections

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.
514 7.4.5 Drugs for erectile dysfunction

CATHETER PATENCY SOLUTIONS

Chlorhexidine 0.02%
Brands include Uro-Tainer Chlorhexidine®, 100-mL sachet = £2.60

Sodium chloride 0.9%
Brands include OptiFlo S®, 50- and 100-mL sachets = £3.20; Uriflex S®, 100-mL sachet = £2.40; Uriflex S™, with integral drug additive port, 100-mL sachet = £2.40; Uro-Tainer Sodium Chloride®, 50- and 100-mL sachets = £3.25; Uro-Tainer M®, with integral drug additive port, 50- and 100-mL sachets = £2.90

Solution G
Citic acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%. Brands include Optiflo G®, 50- and 100-mL sachets = £3.40; Uriflex G®, 100-mL sachet = £2.40; Uro-Tainer® Twin Suby G, 2 x 30-mL = £4.46

Solution R
Citic acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%. Brands include Optiflo R®, 50- and 100-mL sachets = £3.40; Uriflex R®, 100-mL sachet = £2.40; Uro-Tainer® Twin Soluto R, 2 x 30-mL = £4.46

7.4.5 Drugs for erectile dysfunction

Reasons for failure to produce a satisfactory erection include psychogenic, vascular, neurogenic, and endocrine abnormalities; impotence can also be drug-induced. Intracavernosal injection or urethral application of vasoactive drugs under careful medical supervision is used for both diagnostic and therapeutic purposes. Erectile disorders may also be treated with drugs given by mouth which increase the blood flow to the penis. Drugs should be used with caution if the penis is deformed (e.g. in angulation, cavernosal fibrosis, and Peyronie’s disease).

Priapism
If priapism occurs with alprostadil, treatment should not be delayed more than 6 hours and is as follows:

Initial therapy by penile aspiration—using aseptic technique a 19–21 gauge butterfly needle inserted into the corpus cavernosum and 20–50 mL of blood aspirated; if necessary the procedure may be repeated on the opposite side. If initial aspiration is unsuccessful a second 19–21 gauge butterfly needle inserted into the opposite corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.

If aspiration and lavage of corpora are unsuccessful, cautious intracavernosal injection of a sympathomimetic (section 2.7.2) with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (extreme caution: coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) as follows:

- intracavernosal injections of phenylephrine 100–200 micrograms (0.5–1 mL of a 200 microgram/mL solution) every 5–10 minutes; max. total dose 1 mg [unlicensed indication] [important: if suitable strength of phenylephrine injection not available may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection (section 2.7.2) to 5 mL with sodium chloride 0.9%]; alternatively
- intracavernosal injections of adrenaline 10–20 micrograms (0.5–1 mL of a 20 microgram/mL solution) every 5–10 minutes; max. total dose 100 micrograms [unlicensed indication] [important: if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL, section 3.4.3) injection to 5 mL with sodium chloride 0.9%]; alternatively
- intracavernosal injection of metaraminol (caution: has been associated with fatal hypertensive crises); metaraminol 1 mg (0.1 mL of 10 mg/mL metaraminol injection, section 2.7.2) is diluted to 50 mL with sodium chloride injection 0.9% and given carefully by slow injection into the corpora in 5–10 mL injections every 15 minutes [unlicensed indication].

If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle. If sympathomimetics unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

Prescribing on the NHS Drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances (see individual preparations). The Department of Health (England) has recommended that treatment should also be available from specialist services (commissioned by Health Authorities and Primary Care Groups, and operating under local agreement) when the condition is causing severe distress; specialist centres should use form FP10(HP) or form HBP in Scotland or form WP10HP in Wales and endorse them ‘SLS’ if the treatment is to be dispensed in the community. The following criteria should be considered when assessing distress:

- significant disruption to normal social and occupational activities;
- a marked effect on mood, behaviour, social and environmental awareness;
- a marked effect on interpersonal relationships.

Alprostadil
Alprostadil (prostaglandin E₁) is given by intracavernosal injection or intrarethral application for the management of erectile dysfunction (after exclusion of treatable medical causes); it is also used as a diagnostic test.

ALPROSTADIL

Indications erectile dysfunction (including aid to diagnosis)

Cautions priapism—patients should be instructed to report any erection lasting 4 hours or longer—for management, see section 7.4.5; anatomical deformations of penis (painful erection more likely)—follow up
regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie’s disease develop); interactions: Appendix 1 (prostaglandins)

Contra-indications predisposition to prolonged erection (as in sickle cell anaemia, multiple myeloma or leukaemia; not for use with other agents for erectile dysfunction, in patients with penile implants or when sexual activity medically inadvisable; urethral application also contra-indicated in urethral stricture, severe hypospadia, severe curvature, balanitis, urethritis

Side-effects hypotension, hypertension; dizziness, headache; penile pain, other localised pain (buttocks, leg, testicular, abdominal); influenza-like syndrome; urethral burning, urethral bleeding; injection site reactions including penile fibrosis, penile oedema, penile rash, haematoma, haemosiderin deposits; less commonly nausea, dry mouth, vasodilatation, syncope, supraventricular extrasystole, rapid pulse, asthenia, leg cramps, pelvic pain, scrotal or testicular oedema, scrotal erythema, testicular thickening, mic- turation difficulties, haematuria, mydriasis, and sweating; local reactions including penile warmth, pruritus, irritation, penile numbness or sensitivity, balanitis, phimosis, priapism (see section 7.4.5 and under Cautions), abnormal ejaculation; rarely vertigo, urinary-tract infection, and hypersensitivity reactions (including rash, erythema, urticaria, and anaphylaxis)

Dose

- See under preparations below

![Intracavernosal injection

1Caverject (Pharmacia). 2MUSE, 3Viridal

Injection, powder for reconstitution, alprostadil, net price 5-microgram vial = £7.73; 10-microgram vial = £9.24; 20-microgram vial = £11.94; 40-microgram vial = £21.58 (all with diluent-filled syringe, needles and swabs)

Caverject Dual Chamber, double-chamber cartridges (containing alprostadil and diluent), net price 10-microgram cartridge (for doses 2.5–10 micrograms) = £7.35; 20-microgram cartridge (for doses 5–20 micrograms) = £9.50 (both with needles)

Dose by direct intracavernosal injection, ADULT over 18 years, erectile dysfunction, first dose 2.5 micrograms, second dose 5 micrograms (if some response to first dose) or 7.5 micrograms (if no response to first dose), increasing in steps of 5–10 micrograms to obtain dose suitable for producing erection lasting not more than 1 hour; usual range 10–20 micrograms; max. frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Note The first dose must be given by medically trained personnel; self-administration may only be undertaken after proper training

1MUSE (Meda). 2Viridal

Urethral application

Counselling If partner pregnant barrier contraception should be used

![Phosphodiesterase type-5 inhibitors

Sildenafil, tadalafil, and vardenafil are phosphodiesterase type-5 inhibitors licensed for the treatment of erectile dysfunction; they are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing sildenafil, tadalafil or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

Cautions Sildenafil, tadalafil, and vardenafil should be used with caution in cardiovascular disease, left ventricular outflow obstruction, anatomical deformations of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease), and in those with a predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia). Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker (section 2.5.4 and section 7.4.1) can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the
patient is stable on the alpha-blocker; see also interactions: Appendix 1 (sildenafil, tadalafil, vardenafil).

Contra-indications Sildenafil, tadalafil, and vardenafil are contra-indicated in patients receiving nitrates, in patients in whom vasodilatation or sexual activity are inadvisable, or in patients with a previous history of non-arteritic anterior ischaemic optic neuropathy. In the absence of information, manufacturers contra-indicate these drugs in hypotension (avoid if systolic blood pressure below 90 mmHg), recent stroke, unstable angina, and myocardial infarction.

Side-effects The side-effects of sildenafil, tadalafil, and vardenafil include dyspepsia, nausea, vomiting, headache (including migraine), flushing, dizziness, myalgia, back pain, visual disturbances (non-arteritic anterior ischaemic optic neuropathy has been reported—stop drug if sudden visual impairment occurs), and nasal congestion. Less common side-effects include painful red eyes, palpitation, tachycardia, hypotension, hypertension, epistaxis. Other side-effects reported rarely include syncope, hypersensitivity reactions (including rash, facial oedema, and Stevens-Johnson syndrome), seizures, sudden hearing loss (discontinue drug and seek medical advice), and retinal vascular occlusion have also been reported.

SILDENAFIL

Indications erectile dysfunction; pulmonary hypertension (section 2.5.1)

Cautions see notes above; also bleeding disorders or active peptic ulceration; interactions: Appendix 1 (sildenafil)

Contra-indications see notes above; also hereditary degenerative retinal disorders

Hepatic impairment initial dose 25 mg; manufacturer advises avoid in severe impairment

Renal impairment initial dose 25 mg if eGFR less than 30 mL/minute/1.73 m²

Side-effects see notes above; also less commonly chest pain, drowsiness, hypoesthesia, vertigo, tinnitus, dry mouth, fatigue; rarely cerebrovascular accident and atrial fibrillation

Dose

• ADULT over 18 years initially 10 mg at least 30 minutes before sexual activity, subsequent doses adjusted according to response, up to 20 mg as a single dose; max. 1 dose in 24 hours (but daily dose of 10–20 mg not recommended); for patients who anticipate sexual activity at least twice weekly, 5 mg once daily can be taken, reduced to 2.5 mg once daily according to response

Note Effect of intermittent dosing may persist for longer than 24 hours

1Viagra® (Pfizer) Tablets, all blue, f/c, sildenafil (as citrate), 25 mg, net price 4-tab pack = £16.59, 8-tab pack = £33.19; 50 mg, 4-tab pack = £19.34, 8-tab pack = £38.67; 100 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

Revatio® (Pfizer) Tablets
Section 2.5.1 (pulmonary hypertension)

TADALAFIL

Indications erectile dysfunction; pulmonary hypertension (section 2.5.1)

Cautions see notes above; interactions: Appendix 1 (tadalafil)

Contra-indications see notes above; also moderate or severe hepatic impairment

Hepatic impairment max. dose 10 mg; manufacturer advises monitor patient in severe impairment

Renal impairment max. dose 10 mg if eGFR less than 30 mL/minute/1.73 m² (avoid regular once-daily dosing)

Side-effects see notes above; also increased sweating, abdominal pain, and transient amnesia reported

Dose

• ADULT over 18 years initially 10 mg at least 30 minutes before sexual activity, subsequent doses adjusted according to response, up to 20 mg as a single dose; max. 1 dose in 24 hours (but daily dose of 10–20 mg not recommended); for patients who anticipate sexual activity at least twice weekly, 5 mg once daily can be taken, reduced to 2.5 mg once daily according to response

Note Effect of intermittent dosing may persist for longer than 24 hours

1Cialis® (Lilly) Tablets, f/c, tadalafil 2.5 mg (orange), net price 28-tab pack = £54.99; 5 mg (light yellow), 28-tab pack = £54.99; 10 mg (light yellow), 4-tab pack = £26.99; 20 mg (yellow), 4-tab pack = £26.99; 8-tab pack = £53.98

VARDENAFIL

Indications erectile dysfunction

Cautions see notes above; also elderly; bleeding disorders or active peptic ulceration; susceptibility to prolongation of QT interval (including concomitant use of drugs which prolong QT interval); interactions: Appendix 1 (vardenafil)

Contra-indications see notes above; also hereditary degenerative retinal disorders

Hepatic impairment initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment); manufacturer advises avoid in severe impairment

Renal impairment initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m²

Side-effects see notes above; also less commonly drowsiness, dyspepsia, increased lacrimation, photosensitivity; rarely anxiety, transient amnesia, hypotonia, and raised intra-ocular pressure
Dose
- **ADULT** over 18 years, initially 10 mg (patients on alpha-blocker therapy 5 mg) approx. 25–60 minutes before sexual activity, subsequent doses adjusted according to response up to max. 20 mg as a single dose; max. 1 dose in 24 hours
  - **Note** Onset of effect may be delayed if taken with high-fat meal

1**Levitra**® (Bayer Schering)
Tablets, all orange, f/c, vardenafil (as hydrochloride trihydrate) 5 mg, net price 4-tab pack = £7.56, 8-tab pack = £15.12; 10 mg, 4-tab pack = £14.08, 8-tab pack = £28.16; 20 mg, 4-tab pack = £23.48, 8-tab pack = £46.96

Papaverine and phentolamine
Although not licensed the smooth muscle relaxant papaverine has also been given by intracavernosal injection for erectile dysfunction. Patients with neurological or psychogenic impotence are more sensitive to the effect of papaverine than those with vascular abnormalities. Phentolamine is added if the response is inadequate [unlicensed indication].

Persistence of the erection for longer than 4 hours is an emergency, see advice in section 7.4.5.

1 except to treat erectile dysfunction in men who:
- have diabetes, multiple sclerosis, Parkinson’s disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
- are receiving dialysis for renal failure;
- have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
- were receiving Caverject®, Erecnos®, MUSE®, Viagra®, or Viridal® for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
- are suffering severe distress as a result of impotence (prescribed in specialist centres only; see notes above).

The prescription must be endorsed ‘SLS’.
The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics;
- Reconstitution should be carried out in designated pharmacy areas;
- Protective clothing (including gloves, gowns, and masks) should be worn;
- The eyes should be protected and means of first aid should be specified;
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard);
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material;
- Staff exposure to cytotoxic drugs should be monitored.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and
toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

### Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from:

- Department of Health
- PO Box 777
- London SE1 6XH
- Fax: 01623 724524
- It is also available from the Department of Health website (www.dh.gov.uk)

### Safe systems for cytotoxic medicines

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment (see www.cancer.nhs.uk/networks.htm).

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team;
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan;
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration;
- oral cytotoxic medicines should be dispensed with clear directions for use.

### Risks of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer ongoing oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

### Intravenous chemotherapy

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks (www.cancer.nhs.uk/networks.htm) should be consulted prior to prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should not be repeated except on the instructions of a specialist.

### Side-effects of cytotoxic drugs

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers’ product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

### Extravasation of intravenous drugs

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. For information on the prevention and management of extravasation injury, see section 10.3.

### Oral mucositis

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil, methotrexate, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful. Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of anti-septic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.
Hyperuricaemia
Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol (section 10.1.4) should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of allopurinol or azathioprine should be reduced if allopurinol needs to be given concomitantly (see Appendix 1). Rasburicase (section 10.1.4), a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy, for details, see p. 657. It rapidly reduces plasma uric acid and may be of particular value in preventing complications following treatment of leukemias or bulky lymphomas.

Nausea and vomiting
Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to individual susceptibility.

Mildly emetogenic treatment—fluorouracil, etopoide, methotrexate (less than 100 mg/m²), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin, intermediate and low doses of cyclophosphamide, mitoxantrone, and high doses of methotrexate (0.1–1.2 g/m²).

Highly emetogenic treatment—cisplatin, dacarbazine, and high doses of cyclophosphamide.

Prevention of acute symptoms. For patients at low risk of emesis, pretreatment with domperidone or with metoclopramide, continued for up to 24 hours after chemotherapy, is often effective (section 4.6). If metoclopramide or domperidone are not sufficiently effective, additional drugs such as dexamethasone (6–10 mg by mouth) or lorazepam (1–2 mg by mouth) may be used.

For patients at high risk of emesis or when other treatment is inadequate, a specific (5HT,) serotonin antagonist (section 4.6), usually given by mouth, is often highly effective, particularly when used with dexamethasone; adding the neurokinin receptor antagonist, aprepitant (section 4.6) can improve control of cisplatin-related nausea and vomiting.

Prevention of delayed symptoms. Dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide or prochlorperazine. The 5HT, antagonists may be less effective for delayed symptoms.

Prevention of anticipatory symptoms. Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Bone-marrow suppression
All cytotoxic drugs except vincristine and bleomycin cause bone-marrow depression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carbamustine, lomustine, and melphalan. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone marrow has not recovered.

Fever in a neutropenic patient (neutrophil count less than 1.0 × 10⁹/litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of amifostine, p. 522 or recombinant human granulocyte-colony stimulating factors, section 9.1.6.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice (p. 582) and NICE guidance (p. 583).

For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1.

Alopecia
Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Reproductive function
Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be offered where appropriate before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug may have less effect on fertility, but those with an alkylating drug carry the risk of causing permanent...
male sterility (there is no effect on potency). Pre-treatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion-rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Thromboembolism  Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

### Treatment for cytotoxic-induced side-effects

#### Anthracycline side-effects

**Anthracycline-induced cardiotoxicity**  The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

**Dexrazoxane**  an iron chelator, is licensed for the prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic cancer patients who have previously received anthracycline therapy. Patients receiving dexrazoxane should still be monitored for cardiac toxicity. The myelosuppressive effects of dexrazoxane may be additive to those of chemotherapy.

**Anthracycline extravasation**  Dexrazoxane is licensed for the treatment of anthracycline extravasation. The first dose should be given as soon as possible and within six hours after the injury. For further information on the prevention and management of extravasation injury, see section 10.3.

Local guidelines for the management of extravasation should be followed or specialist advice sought.

### DEXRAZOXANE

**Indications**  see notes above and under preparations  
**Cautions**  see notes above; monitor full blood count  
**Hepatic impairment**  monitor liver function  
**Renal impairment**  use with caution—risk of accumulation; manufacturer of Cardioxane® advises reduce dose by 50% if creatinine clearance less than 40 mL/minute  
**Pregnancy**  avoid unless essential (toxicity in animal studies); ensure effective contraception during and for at least 3 months after treatment in men and women  
**Breast-feeding**  discontinue breast-feeding  
**Side-effects**  nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, stomatitis, dry mouth, anorexia; dyspnœa; dizziness, syncope, asthenia, paraesthesia, tremor, fatigue, drowsiness; pyrexia; vaginal haemorrhage; myalgia; blood disorders (including anaemia, leucopenia, neutropenia, and thrombocytopenia); alopecia, pruritus; peripheral oedema, injection-site reactions including phlebitis

**Dose**  see under preparations

---

#### Cardioxane** (Novartis)  
**Intravenous infusion**, powder for reconstitution, dexrazoxane (as hydrochloride), net price 500-mg vial = £156.57

**Dose**  prevention of anthracycline-induced cardiotoxicity.  
**ADULT**  over 18 years, by intravenous infusion (30 minutes prior to anthracycline administration), 20 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose

#### Savene® (SpePharm)  
**Intravenous infusion**, powder for reconstitution, dexrazoxane (as hydrochloride), net price 10 x 500-mg vials (with diluent) = £6750.00

**Dose**  anthracycline extravasation.  
**ADULT**  over 18 years, by intravenous infusion, 1 g/m² (max. 2 g) daily for 2 days, then 500 mg/m² for 1 day  
**Note**  Local coolants such as ice packs should be removed at least 15 minutes before administration

---

### Chemotherapy-induced mucositis and myelosuppression

Folinic acid (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’).

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim. When folinic acid and fluorouracil are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

Palifermin, a human keratinocyte growth factor, is licensed for the management of oral mucositis in patients with haematological malignancies receiving myeloablative radiochemotherapy with autologous haematopoietic stem-cell support.

---

### FOLINIC ACID

**Indications**  see notes above  
**Cautions**  avoid simultaneous administration of methotrexate; not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency;  
**Interactions**  Appendix 1 (folates)  
**Contra-indications**  intrathecal injection  
**Pregnancy**  not known to be harmful; benefit outweighs risk  
**Breast-feeding**  presence in milk unknown but benefit outweighs risk

**Side-effects**  rarely pyrexia after parenteral use; insomnia, agitation, and depression after high doses
**Calcium folinate** (Calcium leucovorin)

**Calcium Folinate (Non-proprietary)**

**Tablets**, scored, folic acid (as calcium salt) 15 mg, net price 10-tab pack = £39.20, 30-tab pack = £85.74

*Brands include Refolinon*®

**Note** Not all strengths and pack sizes are available from all manufacturers

**Injection**, folic acid (as calcium salt) 3 mg/mL, net price 1-mL amp = £4.00, 10-mL amp = £4.62; 7.5 mg/mL, net price 2-mL amp = £7.80; 10 mg/mL, net price 5-mL vial = £19.41, 10-mL vial = £35.09, 30-mL vial = £94.63, 35-mL vial = £90.98

*Brands include Refolinon*®

**Note** Not all strengths and pack sizes are available from all manufacturers

**Injection**, powder for reconstitution, folic acid (as calcium salt), net price 15-mg vial = £4.46; 30-mg vial = £8.36

**Dose**

*Note* Doses expressed as folic acid

Prevention of methotrexate-induced adverse effects, usually started 12–24 hours after start of methotrexate infusion, by intramuscular injection, or by intravenous injection, or by intravenous infusion, 13 mg, repeated every 6 hours for 24 hours (may be continued by mouth); consult local treatment protocol for further information

Suspected methotrexate overdose, by intravenous injection or by intravenous infusion (at a max. rate of 160 mg/minute), initial dose equal to or exceeding dose of methotrexate; consult poisons information service (p. 32) for advice on continuing management

Adjunct to fluorouracil in colorectal cancer, consult product literature

**Disodium levofolate**

**Levofolinic Acid (Non-proprietary)**

**Injection**, levofolinic acid (as disodium salt) 50 mg/mL, net price 1-mL vial = £24.70, 4-mL vial = £80.40

**Dose** as an antidote to methotrexate, by intravenous injection or infusion, consult product literature

Adjunct to fluorouracil in colorectal cancer, consult product literature

**Calcium levofolinate**

**Calcium Levofolate (Non-proprietary)**

**Injection**, levofolinic acid (as calcium salt) 10 mg/mL, net price 17.5-mL vial = £94.63

**Isosorine**® (Wyeth)

**Injection**, levofolinic acid (as calcium salt) 10 mg/mL, net price 2.5-mL vial = £11.62, 17.5-mL vial = £81.33

**Dose**

*Note* Doses expressed as levofolinic acid

Prevention of methotrexate-induced adverse effects, usually started 12–24 hours after beginning of methotrexate infusion, by intramuscular injection, or by intravenous injection or by intravenous infusion, usually 7.5 mg every 6 hours for 10 doses

Suspected methotrexate overdose, by intravenous injection or by intravenous infusion (at a max. rate of 160 mg/minute), initial dose at least 50% of the dose of methotrexate, consult poisons information service (p. 32) for advice on continuing management

Adjunct to fluorouracil in colorectal cancer, consult product literature

**Chemotherapy-induced neutropenic infection and nephrotoxicity**

Amifostine is licensed for the reduction of risk of infection associated with cisplatin- and cyclophosphamide-induced neutropenia in advanced ovarian carcinoma, and for the reduction of nephrotoxicity caused by cisplatin use in advanced solid tumours of non-germ-cell origin. Amifostine is also licensed for protection against xerostomia during radiotherapy for head and neck cancer.

Other drugs for the reduction of risk of infection associated with neutropenia include granulocyte-colony stimulating factors (section 9.1.6).

**AMIFOSTINE**

**Indications** see under Dose

**Cautions** ensure adequate hydration before treatment; infuse with patient supine and monitor arterial blood pressure (interrupt infusion if blood pressure decreases significantly, consult product literature); during chemotherapy interrupt antihypertensive therapy 24 hours before treatment with amifostine and monitor closely; during radiotherapy monitor closely if concomitant antihypertensive therapy; monitor serum-calcium concentration in patients at risk of hypocalcaemia; patients at risk of renal impairment; caution in handling—risk of cutaneous reactions

**Hepatic impairment** avoid—no information available

**Renal impairment** avoid—no information available

**Pregnancy** toxicity in animal studies; avoid

**Breast-feeding** avoid—no information available

**Side-effects** nausea, vomiting, hiccups; hypotension (managed by infusion of sodium chloride 0.9% and
postural management), hypertension, flushing, arrhythmias (including rarely atrial fibrillation, supraventricular tachycardia); sneezing; drowsiness, dizziness, syncope; hypocalcaemia; rarely chest pain, apnoea, seizures, serious skin reactions (including Stevens-Johnson syndrome, toxic epidermal necrolysis, and very rarely exfoliative and bullous dermatitis, toxicodermia), and renal failure; very rarely myocardial infarction, laryngeal oedema, and respiratory arrest.

**Dose**
- Reduction of neutropenia-related risk of infection due to cyclophosphamide and cisplatin treatment in patients with advanced ovarian carcinoma, by intravenous infusion over 15 minutes, ADULT under 70 years, 910 mg/m² started within 30 minutes before chemotherapy (reduced to 740 mg/m² for subsequent cycles if full dose could not be given first time due to hypotension lasting more than 5 minutes after interruption, consult product literature)
- Reduction of nephrotoxicity associated with cisplatin in patients with advanced solid tumours of non-gemcitabine origin, consult product literature
- Prevention of xerostomia during radiotherapy for head and neck cancer, consult product literature

**Ethylol® (Genopharm)**

**Intravenous infusion**, powder for reconstitution, amifostine, net price 500-mg vial = £225.00

**Urothelial toxicity**

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide and ifosfamide; it is caused by the metabolite acrolein. **Mesna** reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

**Mesna (Baxter)**

**Tablets**, f/c, mesna 400 mg, net price 10-tab pack = £42.90; 600 mg, 10-tab pack = £61.10

**Injection**, mesna 100 mg/mL, net price 4-mL amp = £3.95; 10-mL amp = £9.77

**Note** For oral administration contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

**8.1.1 Alkylating drugs**

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication. In addition to the side-effects common to many cytotoxic drugs (section 8.1), there are two problems associated with prolonged usage. Firstly, gametogenesis is often severely affected (section 8.1). Secondly, prolonged use of these drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**Cyclophosphamide** is used mainly in combination with other agents for treating a wide range of malignancies, including some leukemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver. A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication.

When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation) mesna (given initially intravenously then by mouth) can also help prevent cystitis—see under Urothelial Toxicity (section 8.1).

**Ifosfamide** is related to cyclophosphamide and is given intravenously; mesna (section 8.1) is routinely given with it to reduce urothelial toxicity.

**Chlorambucil** is used either alone or in combination therapy for some lymphomas and chronic leukemias. It is given by mouth. Side-effects, apart from bone-marrow suppression, are uncommon. However, patients occasionally develop severe widespread rashes which can progress to Stevens-Johnson syndrome or to toxic epidermal necrolysis. If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.

**Melphalan** is licensed for the treatment of multiple myeloma, polycythemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities. Intestinal pneumonitis and life-threatening pulmonary fibrosis are rarely associated with melphalan.

**Busulfan** is given by mouth to treat chronic myeloid leukaemia. Busulfan given by mouth or intravenously, followed by cyclophosphamide, is also licensed as conditioning treatment before haematopoietic stem-cell transplantation in adults and children. Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia. Rarely, progressive pulmonary fibrosis is associated
with busulfan. Skin hyperpigmentation is a common side-effect of oral therapy.

**Lomustine** is a lipid-soluble nitrosourea and is given by mouth. It is used mainly to treat Hodgkin’s disease resistant to conventional therapy, malignant melanoma and certain solid tumours. Bone-marrow toxicity is delayed, and the drug is therefore given at intervals of 4 to 6 weeks. Permanent bone-marrow damage can occur with prolonged use. Nausea and vomiting are common and moderately severe.

**Bendamustine** given intravenously is licensed for the treatment of chronic lymphocytic leukaemia, non-Hodgkin’s lymphoma, and for the treatment of multiple myeloma.

**Carmustine** given intravenously has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin’s lymphomas, and brain tumours. Cumulative renal damage and delayed pulmonary fibrosis may occur with intravenous use. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

---

**NICE guidance** (carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma)

See p. 540

**BENDAMUSTINE HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see section 8.1; monitor cardiac function; monitor serum potassium and ECG; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (busulfan)

**Hepatic impairment** manufacturer advises monitor liver function—no information available

**Pregnancy** avoid (teratogenic in animals); manufacturers advise effective contraception during and for 6 months after treatment in men or women; see also Reproductive function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also anorexia, diarrhoea, constipation, haemorrhage, hypotension, hypertension, palpitation, angina, arrhythmias, respiratory dysfunction, insomnia, pain, chills, malaise, infection, pyrexia, amenorrhoea, dehydration, electrolyte disturbances (including hypokalaemia); less commonly pericardial effusion; rarely acute circulatory failure, drowsiness, voice changes, sweating; very rarely taste disturbance, tachycardia, myocardial infarction, cardiac failure, pulmonary fibrosis, paraesthesia, peripheral neuropathy, neurological disorders, ataxia, anticholinergic syndrome, encephalitis, phlebitis, multiple organ failure, haemolysis; also reported secondary tumours, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Levact** (Napp) £5.20

Injection, powder for reconstitution, bendamustine hydrochloride, net price 25-mg vial = £69.45; 100-mg vial = £275.81

---

**BUSULFAN** (Busulphan)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor cardiac function; previous radiation therapy; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (busulfan)

**Hepatic impairment** manufacturer advises monitor liver function—no information available

**Pregnancy** avoid (teratogenic in animals); manufacturers advise effective contraception during and for 6 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also hematotoxicity (including hepatic veno-occlusive disease, hyperbilirubinaemia, jaundice and fibrosis); cardiac tamponade in thalassaemia; pneumonia; skin hyperpigmentation

**Dose**
- Chronic myeloid leukaemia, induction of remission, by mouth, 60 micrograms/kg daily (max. 4 mg); maintenance, usually 0.5–2 mg daily
- Conditioning treatment before haematopoietic stem-cell transplantation, by mouth or by intravenous infusion, consult product literature

**Myleran** (GSK) £5.20

Tablets, f/c, busulfan 2 mg, net price 25-tab pack = £5.20

**Busilvex** (Fabre) £5.20

Concentrate for intravenous infusion, busulfan 6 mg/mL, net price 10-mL vial = £201.25

---

**CARMUSTINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (carmustine)

**Pregnancy** avoid (teratogenic and embryotoxic in animals); manufacturer advises effective contra-
Contraindications: See section 8.1; congestive heart failure; pregnancy.
Indications: Cyclophosphamide (Non-proprietary) - see section 8.1 and notes above; irritant to tissues.

Gliadel® (Archimedes) Implant, carmustine 7.7 mg, net price = £585.34

CHLORAMBUCIL
Indications: see notes above
Cautions: see section 8.1 and notes above; history of epilepsy and children with nephrotic syndrome (increased risk of seizures); avoid in acute porphyria (but see section 9.8.2). Hepatic impairment: manufacturer advises consider dose reduction in severe impairment—limited information available.

Pregnancy: avoid; manufacturer advises effective contraception during treatment in men or women; see also Reproductive Function, p. 520.
Breast-feeding: discontinue breast-feeding.
Side-effects: see section 8.1 and notes above.

Leukeran® (GSK) Tablets, f/c, brown, chlorambucil 2 mg, net price 25-tab pack = £8.36

CYCLOPHOSPHAMIDE
Indications: see notes above; rheumatoid arthritis (section 10.1.3)
Cautions: see section 8.1 and notes above; previous or concurrent mediastinal irradiation—risk of cardiotoxicity; diabetes mellitus; avoid in acute porphyria (but see section 9.8.2). Hepatic impairment: reduce dose—consult local treatment protocol for details.

Renal impairment: reduce dose—consult local treatment protocol for details.

Pregnancy: avoid (manufacturer advises effective contraception during and for at least 3 months after treatment in men or women); see also Reproductive Function, p. 520.
Breast-feeding: discontinue breast-feeding.

Side-effects: see section 8.1 and notes above.

Cyclophosphamide (Non-proprietary) Tablets, s/c, cyclophosphamide (anhydrous) 50 mg, net price 100 = £20.20. Label: 25, 27
Injection, powder for reconstitution, cyclophosphamide, net price 500-mg vial = £5.66; 1-g vial = £10.66

Estracyt® (Pharmacia) Capsules, estramustine phosphate 140 mg (as disodium salt), net price 100-cap pack = £171.28. Label: 23, counselling, see above

IFOSFAMIDE
Indications: see notes above
Cautions: see section 8.1 and notes above; ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi’s syndrome or diabetes insipidus if renal toxicity not treated promptly); diabetes mellitus; avoid in acute porphyria (but see section 9.8.2). Interactions: Appendix 1 (ifosfamide)

Contra-indications: urinary-tract obstruction; acute infection (including urinary-tract infection); urothelial damage.

Hepatic impairment: avoid
Renal impairment: avoid if serum creatinine concentration greater than 120 micromol/litre.

Pregnancy: avoid (teratogenic and carcinogenic in animals); manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520.
Breast-feeding: discontinue breast-feeding.

Side-effects: see section 8.1 and notes above; also: drowsiness, confusion, disorientation, restlessness, psychosis; urothelial toxicity; renal toxicity (see Cautions above); less commonly severe encephalopathy; rarely diarrhoea, constipation, convulsions, anorexia, very rarely jaundice, thrombophlebitis, syndrome of inappropriate antidiuretic hormone secretion; acute pancreatitis, arrhythmias, and heart failure also reported.

Ifosfamide (Non-proprietary) Injection, powder for reconstitution, ifosfamide, net price 1-g vial = £43.53; 2-g vial = £88.62 (hosp. only)

LOMUSTINE
Indications: see notes above
Cautions: see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2). Interactions: Appendix 1 (lomustine).

Contra-indications: coeliac disease.

Renal impairment: avoid in severe impairment.
8 Malignant disease and immunosuppression

Pregnancy avoid (manufacturer advises effective contraception during and for at least 6 months after treatment in men or women); see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above
Dose
- Used alone, 120–130 mg/m² body-surface every 6–8 weeks

Lomustine (Medac) Capsules, blue/clear, lomustine 40 mg, net price 20-cap pack = £455.62
Note The brand name CCNU® has been used for lomustine capsules.

**MELPHALAN**

Indications see notes above
Cautions see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (melphalan)
Renal impairment reduce dose initially (consult product literature)
Pregnancy avoid (manufacturer advises adequate contraception during treatment in men and women); see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above
Dose
- By mouth, multiple myeloma, dose may vary according to regimen; typical dose 150 micrograms/kg daily for 4 days, repeated every 6 weeks
- Polychaetemia vera, initially, 6–10 mg daily reduced after 5–7 days to 2–4 mg daily until satisfactory response then further reduce to 2–6 mg per week
- By intravenous injection or infusion and regional arterial perfusion, consult product literature

Alkeran® (GSK) Tablets, melphalan 2 mg, net price 25 = £13.75
Injection, powder for reconstitution, melphalan 50 mg (as hydrochloride), net price 50-mg vial (with solvent-diluent) = £33.13

**THIOTEPA**

Indications see notes above and section 7.4.4
Cautions see section 8.1; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (thiotepa)
Pregnancy avoid (teratogenic and embryotoxic in animals); see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1
Thiotepa (Goldshield) Injection, powder for reconstitution, thiotepa, net price 15-mg vial = £5.20
Tepadina® (Intrapharm) Injection, powder for reconstitution, thiotepa, net price 15-mg vial = £123.00; 100-mg vial = £736.00

**TREOSULFAN**

Indications see notes above
Cautions see section 8.1; avoid in acute porphyria (but see section 9.8.2)

Pregnancy avoid; see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above
Dose
- Consult product literature

Treasulfan (Medac) Capsules, treosulfan 250 mg, net price 100-cap pack = £435.03 Label: 25
Injection, powder for reconstitution, treosulfan, net price 1 g = £39.44; 5 g = £152.41 (both in infusion bottle with transfer needle)

**8.1.2 Anthracyclines and other cytotoxic antibiotics**

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be avoided as it may result in markedly enhanced toxicity.

Daunorubicin, doxorubicin, epirubicin and idarubicin are anthracycline antibiotics. Mitoxantrone is an anthracycline derivative.

Doxorubicin is used to treat the acute leukaemias, Hodgkin’s and non-Hodgkin’s lymphomas, paediatric malignancies, and some solid tumours including breast cancer. It is given by injection into a fast-running infusion, commonly at 21-day intervals. Extravasation can cause severe tissue necrosis. Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose. Diarrhoea, dehydration, and red coloration of the urine can commonly occur, and renal damage has been reported. Supraventricular tachycardia related to drug administration is an uncommon complication. Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m² because symptomatic and potentially fatal heart failure is common above this dose. Patients should be assessed before treatment by echocardiography; the elderly, and those with cardiac disease, hypertension, or who have received myocardial irradiation, should be treated cautiously. Cardiac monitoring may assist in determining safe dosage. Some evidence suggests that weekly low-dose administration may be less cardiotoxic. Doxorubicin is also given by bladder instillation for the treatment of transitional cell carcinoma, papillary bladder tumours and carcinoma in-situ.

Liposomal formulations of doxorubicin for intravenous use are also available. They may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer) See p. 542
Epirubicin is structurally related to doxorubicin and clinical trials suggest that it is as effective in the treatment of breast cancer. A maximum cumulative dose of 0.9–1 g/m² is recommended to help avoid cardiotoxicity. Like doxorubicin it is given intravenously and by bladder instillation. Hyperpigmentation of skin, nails, and oral mucosa, and red coloration of the urine, may occur.

Idarubicin has general properties similar to those of doxorubicin; it is mostly used in the treatment of haematological malignancies. Diarrhoea, abdominal pain, haemorrhage, cardiac disorders, rash, and red pigmentation of the urine are commonly reported. Skin and nail hyperpigmentation have been reported less frequently. Idarubicin is given intravenously and it may also be given by mouth.

Daunorubicin also has general properties similar to those of doxorubicin. It should be given by intravenous infusion and is indicated for acute leukaemias. A liposomal formulation for intravenous use is licensed for infusion and is indicated for acute leukaemias. A liposomal formulation for intravenous use is licensed for AIDS-related Kaposis sarcoma.

Mitoxantrone is structurally related to doxorubicin; it is used for metastatic breast cancer. Mitoxantrone is also licensed for treatment of non-Hodgkin’s lymphoma, adult acute non-lymphocytic leukaemia, and non-resectable primary hepatocellular carcinoma. It is given intravenously and is well tolerated, but myelosuppression and dose-related cardiotoxicity occur; cardiac examinations are recommended after a cumulative dose of 160 mg/m².

Bleomycin is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin’s lymphoma. It causes little bone-marrow suppression but dermatological toxicity is common and increased pigmention particularly affecting the flexures and subcutaneous sclerotic plaques may occur. Mucositis is also relatively common and an association with Raynaud’s phenomenon is reported. Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously. The principal problem associated with the use of bleomycin is progressive pulmonary fibrosis. This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units (see Bleomycin, below) and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug. Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100 000 units—see Bleomycin below) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

Daunorubicin is principally used to treat paediatric cancers; it is given intravenously. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone-marrow toxicity and therefore it is usually administered at 6-weekly intervals. Prolonged use may result in permanent bone-marrow damage. It may also cause lung fibrosis and renal damage.

**BLEOMYCIN**

**Indications** squamous cell carcinoma; see also notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; **Interactions**: Appendix 1 (bleomycin)

**Renal impairment** reduce dose by half if serum-creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre

**Pregnancy** avoid (teratogenic and carcinogenic in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Bleomycin (Non-proprietary)***

Injection, powder for reconstitution, bleomycin (as sulphate), net price 15 000-unit vial = £15.56

**Note** To conform to the European Pharmacopoeia vials previously labelled as containing ‘15 units’ of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

**Brands** include *Bleo-Kyowa*®

**DACTINOMYCIN**

(Actinomycin D)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues

**Pregnancy** avoid (teratogenic in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Cosmegen Lyovac® (Ovation)***

Injection, powder for reconstitution, dactinomycin, net price 500-microgram vial = £8.75

**DAUNORUBICIN**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues

**Hepatic impairment** reduce dose according to serum bilirubin concentration—consult local protocol for details

**Renal impairment** reduce dose by 25% if serum creatinine 105–265 micromol/litre and by 50% if serum creatinine greater than 265 micromol/litre

**Pregnancy** avoid (teratogenic and carcinogenic in *animal* studies); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Daunorubicin (Non-proprietary)***

Injection, powder for reconstitution, daunorubicin (as hydrochloride), net price 20-mg vial = £55.00

**Note** The brand name *Corubid®* was formerly used.

Malignant disease and immunosuppression

8.1.3 Antimetabolites

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines. It is given by mouth, intravenously, intramuscularly, or intrathecally.

Methotrexate is used as maintenance therapy for childhood acute lymphoblastic leukaemia. Other uses include choriocarcinoma, non-Hodgkin’s lymphoma, and a number of solid tumours. Intrathecal methotrexate is used in the CNS prophylaxis of childhood acute lymphoblastic leukaemia, and as a therapy for established meningeal cancer or lymphoma.

Methotrexate causes myelosuppression, mucositis, and rarely pneumonitis. It is contraindicated in significant renal impairment because it is excreted primarily by the kidney. It is also contra-indicated in patients with severe hepatic impairment. It should also be avoided in the presence of significant pleural effusion or ascites because it can accumulate in these fluids, and its subsequent return to the circulation may cause myelosuppression. Systemic toxicity may follow intrathecal administration and blood counts should be carefully monitored.

Folinic acid (section 8.1) following methotrexate administration helps to prevent methotrexate-induced mucositis or myelosuppression.

Capecitabine, which is metabolised to fluorouracil, is given by mouth. It is licensed as monotherapy or combination therapy for adjuvant treatment of advanced colon cancer following surgery, for monotherapy or combination therapy of metastatic colorectal cancer, and for first-line treatment of advanced gastric cancer in combination with a platinum-based regimen. Capecitabine is also licensed for second-line treatment of locally advanced or metastatic breast cancer either in combination with docetaxel (where previous therapy included an anthracycline) or alone (after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated). For the role of capecitabine in the treatment of breast cancer, see section 8.3.4.1.

**NICE guidance**

Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer

(April 2006)

Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer.

**NICE guidance**

Capecitabine and tegafur with uracil for metastatic colorectal cancer

(May 2003)

Capecitabine or tegafur with uracil (in combination with folinic acid) is an option for the first-line treatment of metastatic colorectal cancer.

Cytarabine acts by interfering with pyrimidine synthesis. It is given subcutaneously, intravenously, or intrathecally. Its predominant use is in the induction of remission of acute myeloblastic leukaemia. It is a potent myelosuppressant and requires careful haematological monitoring. A liposomal formulation of cytarabine for intrathecal use is licensed for lymphomatous meningitis.

Fludarabine is licensed for the initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first-line treatment in patients with sufficient bone-marrow reserves; it is usually given by mouth, but can be given by intravenous injection or infusion. Fludarabine is well tolerated but it does cause myelosuppression, which may be cumulative. Immunosuppression is also common (see panel on cladribine and fludarabine below), and co-trimoxazole is used to prevent pneumocystis infection. Immune-mediated haemolytic anaemia, thrombocytopenia, and neutropenia are less common side-effects.

The Scottish Medicines Consortium (p. 4) has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) or after first-line treatment in patients with sufficient bone-marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

**NICE guidance**

Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia

(February 2007)

Fludarabine monotherapy, is not recommended for the first-line treatment of chronic lymphocytic leukaemia.
Cladribine is given by intravenous infusion for the treatment of hairy cell leukaemia. It is also given for chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent. Cladribine produces severe myelosuppression, with neutropenia, anaemia, and thrombocytopenia; haemolytic anaemia has also been reported. High doses of cladribine have been associated with acute renal failure and severe neurotoxicity.

Nelarabine (Atriance®) is accepted for restricted use within NHS Scotland in combination (January 2010) that pemetrexed (Alimta®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

Fluorouracil is usually given intravenously because absorption following oral administration is unpredictable. It is used to treat a number of solid tumours, including gastro-intestinal tract cancers and breast cancer. It is commonly used with folic acid in advanced colorectal cancer. It may also be used topically for certain malignant and pre-malignant skin lesions. Toxicity is unusual, but may include myelosuppression, mucositis, and rarely a cerebellar syndrome. On prolonged infusion, a desquamative hand–foot syndrome may occur.

Gemcitabine for the treatment of metastatic breast cancer (January 2007)

Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 (Karnofsky score is a measure of the ability to perform ordinary tasks). Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma.
Pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

**NICE guidance**

**Pemetrexed for the malignant pleural mesothelioma (January 2008)**

Pemetrexed is an option for the treatment of malignant pleural mesothelioma in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.

**Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009)**

Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma.

**Pemetrexed for the treatment of non-small cell lung cancer (August 2007)**

Pemetrexed is not recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy.

**Pemetrexed for the treatment of non-small cell lung cancer (June 2010)**

Pemetrexed is an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following combination therapy of a platinum compound with either gemcitabine, paclitaxel, or docetaxel.

Raltitrexed, a thymidylate synthase inhibitor, is given intravenously for palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used. It is probably of similar efficacy to fluorouracil. Raltitrexed is generally well tolerated, but can cause marked myelosuppression and gastrointestinal side-effects.

**NICE guidance (irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer)**

See p. 542

Mercaptopurine is used as maintenance therapy for the acute leukaemias and in the management of ulcerative colitis and Crohn’s disease (section 1.5.3). Azathioprine, which is metabolised to mercaptopurine, is generally used as an immunosuppressant (section 8.2.1 and section 10.1.3). The dose of both drugs should be reduced if the patient is receiving allopurinol since it interferes with their metabolism.

**Tegafur** (in combination with uracil) is given by mouth, together with calcium folinate, in the management of metastatic colorectal cancer. Tegafur is a prodrug of fluorouracil; uracil inhibits the degradation of fluorouracil. Tegafur (with uracil) has been shown to be of similar efficacy as a combination of fluorouracil and folinic acid for metastatic colorectal cancer. For NICE guidance on capecitabine and tegafur with uracil for metastatic colorectal cancer, see above.

**Tioguanine** is given by mouth for the treatment of acute leukaemias and chronic myeloid leukaemia. It can be given at various stages of treatment in short-term cycles. Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine. Long-term therapy is no longer recommended because of the high risk of liver toxicity; treatment with tioguanine should be discontinued if liver toxicity develops.

Azacitidine is a pyrimidine analogue that is given by subcutaneous injection. It is used in the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haemopoietic stem cell transplantation.
CAPECITABINE

Indications  see notes above

Cautions  see section 8.1; history of significant cardiovascular disease, arrhythmias; monitor plasma-calciu m concentration; diabetes mellitus; interactions: Appendix 1 (fluorouracil)

Hepatic impairment  manufacturer advises avoid in severe impairment

Renal impairment  reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute; avoid if creatinine clearance less than 30 mL/minute

Pregnancy  avoid (teratogenic in animal studies); see also Reproductive Function, p. 520

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1; hand–foot (desquamative) syndrome; diarrhoea

Dose

- Stage III colon cancer, adjuvant following surgery, monotherapy, ADULT over 18 years 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval; recommended duration of treatment 6 months
- Stage III colon cancer, adjuvant following surgery, in combination therapy, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7–day interval; recommended duration of treatment 6 months
- Metastatic colorectal cancer, monotherapy, ADULT over 18 years 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval
- Metastatic colorectal cancer, in combination therapy, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval
- Advanced gastric cancer, in combination with a platinum-based regimen, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval or 625 mg/m² twice daily given continuously
- Locally advanced or metastatic breast cancer, monotherapy or in combination with docetaxel, ADULT over 18 years 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval

Note  Adjust dose according to tolerability—consult product literature

Xeloda® (Roche)

Tablets  f/c, peach, capecitabine 150 mg, net price 60-tab pack = £40.02; 500 mg, 120-tab pack = £265.55. Label: 21

CLOFARABINE

Indications  see notes above

Cautions  see section 8.1 and notes above; cardiac disease

Hepatic impairment  manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment  manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Pregnancy  manufacturer advises avoid (teratogenic in animal studies); see also Reproductive Function, p. 520

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1; also diarrhoea, abdominal pain, flatulence; oedema, tachycardia; cough, dyspnoea; dizziness, insomnia, anxiety, headache; chills, asthenia, malaise; myalgia, arthralgia; sweating, rash, pruritus, and purpura

Leustat® (Janssen-Cilag) [BNF]

Concentrate for intravenous infusion, cladribine 1 mg/mL. For dilution and use as an infusion, net price 10-mL vial = £159.70

For hairy cell leukaemia and for B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent

Litak® (Lipomed) [BNF]

Injection (for subcutaneous use only—no dilution required), cladribine 2 mg/mL, net price 5-mL vial = £165.00

For hairy cell leukaemia

CYTARABINE

Indications  see notes above

Cautions  see section 8.1 and notes above; interactions: Appendix 1 (cytarabine)

Hepatic impairment  reduce dose

Pregnancy  avoid (teratogenic in animal studies); see also Reproductive Function, p. 520

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1 and notes above

Cytarabine (Non-proprietary) [BNF]

Injection (for intravenous, subcutaneous, or intrathecal use), cytarabine 20 mg/mL, net price 5-mL vial = £4.00

Injection (for intravenous or subcutaneous use), cytarabine 20 mg/mL, net price 5-mL vial = £3.90, 25-mL vial = £19.50; 100 mg/mL, 1-mL vial = £4.00, 5-mL vial = £20.00, 10-mL vial = £39.00, 20-mL vial = £77.50

Electrolytes  Na⁺ 3.08 mmol/vial
**Lipid formulation for intrathecal use**

*DepoCyte®* (Napp) (FLUDARABINE PHOSPHATE)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to skin cancer; interactions: Appendix 1 (fludarabine)

**Contra-indications** haemolytic anaemia

**Renal impairment** reduce dose by up to 50% if creatinine clearance 30–70 mL/minute; avoid if creatinine clearance less than 30 mL/minute

**Pregnancy** avoid (embryotoxic and teratogenic in animal studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also diarrhoea, anorexia; oedema; pneumonia; cough; peripheral neuropathy; visual disturbances; chills, fever, malaise, weakness; rash

**Dose**
- By mouth, ADULT 40 mg/m² for 5 days every 28 days usually for 6 cycles
- By intravenous injection or infusion, consult product literature

*Fludarabine (Non-proprietary)* (GENZYME)

**Injection**, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £140.40

*Fludara®* (Genzyme)

**Tablets**, f/c, pink, fludarabine phosphate 10 mg, net price 15-tab pack = £268.12, 20-tab pack = £350.70

**Injection**, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £147.07

**FLUOROURACIL**

**Indications** see notes above; pre-malignant and malignant skin lesions (section 13.8.1)

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; interactions: Appendix 1 (fluorouracil)

**Hepatic impairment** manufacturer advises caution

**Pregnancy** avoid (teratogenic); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also local irritation with topical preparation

**Dose**
- By mouth, maintenance 15 mg/kg weekly; max. in one day 1 g
- By intravenous injection or infusion or by intra-arterial infusion, consult product literature

*Fluorouracil (Non-proprietary)* (GSK)

**Capsules**, fluorouracil 250 mg, available from ‘special-order’ manufacturers or specialist importing companies, p. 988

**Injection**, fluorouracil (as sodium salt) 25 mg/mL, net price 10-mL vial = £3.20, 20-mL vial = £6.40, 100-mL vial = £32.00; 50 mg/mL, 10-mL vial = £6.40; 20-mL vial = £12.80; 50-mL vial = £32.00; 100-mL vial = £64.00

**GEMCITABINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; interactions: Appendix 1 (gemcitabine)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** avoid (teratogenic in animal studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

*Gemcitabine (Non-proprietary)* (Lilly)

**Injection**, powder for reconstitution, gemcitabine (as hydrochloride), net price 200-mg vial = £32.00, 1-g vial = £162.00, 1.5-g vial = £213.93, 2-g vial = £324.00

**Gemzar®** (Lilly)

**Injection**, powder for reconstitution, gemcitabine (as hydrochloride), net price 200-mg vial = £32.55; 1-g vial = £162.76

**MERCAPTOPURINE** (6-Mercaptopurine)

**Indications** acute leukaemias and chronic myeloid leukaemia; inflammatory bowel disease [unlicensed indication] (section 1.5.3)

**Cautions** see section 8.1 and notes above; monitor liver function; interactions: Appendix 1 (mercaptopurine)

**Hepatic impairment** may need dose reduction

**Renal impairment** reduce dose

**Pregnancy** avoid (teratogenic); see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also gastrointestinal ulceration, pancreatitis; very rarely lymphoma

**Dose**
- Initially 2.5 mg/kg daily

*Puri-Nethol®* (GSK)

**Tablets**, yellow, scored, mercaptopurine 50 mg, net price 25-tab pack = £22.54

**METHOTREXATE**

**Indications** see notes above and under Dose: Crohn’s disease [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.3)

**Cautions** see section 8.1, notes above and section 10.1.3; interactions: Appendix 1 (methotrexate)

**Hepatic impairment** avoid in severe impairment
Renal impairment  reduce dose; risk of nephrotoxicity at high doses; avoid in severe impairment

Pregnancy avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Reproductive Function, p. 520

Breast-feeding discontinue breast-feeding—present in milk.

Side-effects see section 8.1, notes above and section 10.1.3

Dose  

- By mouth, leukaemia in children (maintenance), 15 mg/m² weekly in combination with other drugs

Important  

Note that the above dose is a weekly dose.

- By intravenous injection or infusion, or by intra-arterial infusion, or by intramuscular injection, or intrathecal administration, consult product literature

Methotrexate (Non-proprietary)  

Injection, methotrexate (as sodium salt) 2.5 mg/mL, net price 2-mL vial = £1.68, 25 mg/mL, 2-mL vial = £3.00, 20-mL vial = £30.00

Injection, methotrexate 100 mg/mL (not for intrathecal use), net price 10-mL vial = £78.33, 50-mL vial = £380.07

Oral preparations  

Section 10.1.3

NELARABINE  

Indications see notes above
Cautions see section 8.1 and notes above; previous or concurrent intrathecal chemotherapy or craniospinal irradiation (increased risk of neurotoxicity)

Driving May affect performance of skilled tasks (e.g. driving)

Pregnancy avoid (toxicity in animal studies); manufacturer advises effective contraception during and for at least 3 months after treatment in men and women; see also Reproductive Function, p. 520

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1, also gastrointestinal disturbances; oedema; neuropathy; dehydration; conjunctivitis; increased lacrimation; skin disorders; less commonly colitis, arrhythmias, and interstitial pneumonitis; rarely hepatitis; peripheral ischaemia and acute renal failure also reported

Alimta® (Lilly)  

Injection, powder for reconstitution, pemetrexed (as disodium), net price 100-mg vial = £160.00, 500-mg vial = £800.00

Electrolytes Na⁺ < 0.5 mmol/vial

RALTITREXED  

Indications see notes above
Cautions see section 8.1 and notes above; interactions: Appendix 1 (raltitrexed)

Hepatic impairment caution in mild to moderate impairment; avoid if severe

Renal impairment reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature); avoid if creatinine clearance less than 25 mL/minute

Pregnancy pregnancy must be excluded before treatment; ensure effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Tomudex® (Hospira)  

Injection, powder for reconstitution, raltitrexed, net price 2-mg vial = £152.33

TEGAFUR WITH URACIL  

Indications see notes above
Cautions see section 8.1; cardiac disease; interactions: Appendix 1 (fluorouracil)

Hepatic impairment manufacturer advises monitor liver function in mild to moderate impairment and avoid in severe impairment

Renal impairment use with caution

Pregnancy avoid; manufacturer advises effective contraception during and for 3 months after treatment in men or women; see also Reproductive Function, p. 520

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose  

- ADULT, tegafur 300 mg/m² (with uracil 672 mg/m²) daily in 3 divided doses for 28 days; subsequent courses repeated after 7-day interval; for dose adjustment due to toxicity, consult product literature

PEMETREXED  

Indications see notes above
Cautions see section 8.1 and notes above; history of cardiovascular disease; diabetes; prophyllactic folic acid and vitamin B₁₂ supplementation required (consult product literature); concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature); interactions: Appendix 1 (pemetrexed)

Renal impairment manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available

Pregnancy avoid (toxicity in animal studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; see also Reproductive Function, p. 520

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1, also gastro-intestinal disturbances; oedema; neuropathy; dehydration; conjunctivitis; increased lacrimation; skin disorders; less commonly colitis, arrhythmias, and interstitial pneumonitis; rarely hepatitis; peripheral ischaemia and acute renal failure also reported

Alimta® (GSK)  

Injection, methotrexate (as sodium salt) 2.5 mg/mL, net price 2-mL vial = £1.68, 25 mg/mL, 2-mL vial = £3.00, 20-mL vial = £30.00

Injection, methotrexate 100 mg/mL (not for intrathecal use), net price 10-mL vial = £78.33, 50-mL vial = £380.07

Oral preparations  

Section 10.1.3

BENEFIXED

Tomudex® (Hospira)  

Injection, powder for reconstitution, raltitrexed, net price 2-mg vial = £152.33

TEGAFUR WITH URACIL  

Indications see notes above
Cautions see section 8.1; cardiac disease; interactions: Appendix 1 (fluorouracil)

Hepatic impairment manufacturer advises monitor liver function in mild to moderate impairment and avoid in severe impairment

Renal impairment use with caution

Pregnancy avoid; manufacturer advises effective contraception during and for 3 months after treatment in men or women; see also Reproductive Function, p. 520

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose  

- ADULT, tegafur 300 mg/m² (with uracil 672 mg/m²) daily in 3 divided doses for 28 days; subsequent courses repeated after 7-day interval; for dose adjustment due to toxicity, consult product literature

Hepatic impairment manufacturer advises monitor liver function in mild to moderate impairment and avoid in severe impairment

Renal impairment use with caution

Pregnancy avoid; manufacturer advises effective contraception during and for 3 months after treatment in men or women; see also Reproductive Function, p. 520

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose  

- ADULT, tegafur 300 mg/m² (with uracil 672 mg/m²) daily in 3 divided doses for 28 days; subsequent courses repeated after 7-day interval; for dose adjustment due to toxicity, consult product literature
8.1.4 Vinca alkaloids and etoposide

The vinca alkaloids, vinblastine, vincristine, vindesine, vinorelbine, and vinflunine cause severe local irritation and care must be taken to avoid extravasation. Severe bronchospasm has been reported following administration of the vinca alkaloids (more commonly when used in combination with mitomycin-C).

Important
Vinblastine, vincristine, vindesine, vinorelbine, and vinflunine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days. It has particularly useful activity in small cell carcinoma of the bronchus, the lymphomas, and testicular cancer.

8.1.4 Vinca alkaloids and etoposide

The vinca alkaloids, vinblastine, vincristine, vindesine, and vinorelbine, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer). Vinorelbine is a semi-synthetic vinca alkaloid. It is given intravenously or orally for the treatment of advanced breast cancer and for advanced non-small cell lung cancer. For the role of vinorelbine in the treatment of breast cancer, see section 8.3.4.1.

Vincristine is licensed as monotherapy for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen.

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine; it occurs less often with vindesine, vinblastine, vinorelbine, and vinflunine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.

Myelosuppression is a dose-limiting side-effect of vinblastine, vindesine, vinorelbine, and vinflunine; vincristine causes negligible myelosuppression. The vinca alkaloids cause severe local irritation and care must be taken to avoid extravasation. Severe bronchospasm has been reported following administration of the vinca alkaloids (more commonly when used in combination with mitomycin-C).
8.1.4 Vinca alkaloids and etoposide

**Vinblastine** (Non-proprietary) *(Genus)*

Injection, vinblastine sulphate 1 mg/mL, net price 1-mL vial = £13.09

Cautions

see section 8.1 and notes above; neuro-muscular disease; caution in handling; interactions: Appendix 1 (vinblastine)

Contra-indications

see section 8.1 and notes above; muscular disease; caution in handling; interactions: Appendix 1 (vincristine)

Hepatic impairment

dose reduction may be necessary

Renal impairment

reduce dose if creatinine clearance less than 60 mL/minute—consult product literature

Pregnancy

avoid unless essential—teratogenicity and embryotoxicity in animal studies; manufacturer advises effective contraception during and for up to 3 months after treatment; see also Reproductive Function, p. 520

Breast-feeding

discontinue breast-feeding

Side-effects

see section 8.1 and notes above; also anorexia, diarrhoea, dyspepsia, tachycardia, hypertension, hypotension, thrombosis; oedema; insomnia; fatigue; dehydration; cutaneous reactions, sweating; less commonly increased weight, myocardial infarction, renal failure; also reported QT-interval prolongation, inappropriate anti-diuretic hormone secretion, blurred vision

Javlor® (Fabre) *(Genus)*

Concentrate for intravenous infusion, vinflunine (as ditartrate) 25 mg/mL, net price 2-mL vial = £212.50, 10-mL vial = £1062.50

**Vinflunine** (Non-proprietary) *(Genus)*

Concentrate for intravenous infusion, vinflunine (as tartrate) 20 mg (brown), net price 2-mL vial = £212.50, 10-mL vial = £1062.50

Cautions

see section 8.1 and notes above; ischaemic heart disease; caution in handling; interactions: Appendix 1 (vinorelbine)

Contra-indications

see section 8.1 and notes above; with capsules previous significant surgical resection of stomach or small bowel, long-term oxygen therapy, concurrent radiotherapy if treating the liver

Hepatic impairment

reduce oral dose in moderate impairment, avoid oral use in severe impairment; reduce intravenous dose in severe impairment; consult product literature

Pregnancy

avoid unless essential (teratogenicity, and fetal loss in animal studies); manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for 3 months after treatment; see also Reproductive Function, p. 520

Breast-feeding

discontinue breast-feeding

Side-effects

see section 8.1 and notes above; also rarely pancreatitis; inappropriate secretion of anti-diuretic hormone also reported; irritant to tissues

Dose

- By mouth, 60 mg/m² once weekly for 3 weeks, increased if tolerated to 80 mg/m² once weekly; max. 160 mg once weekly
- By intravenous injection or infusion, consult product literature

**Vinorelbine** (Non-proprietary) *(Genus)*

Concentrate for intravenous infusion, vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.00, 5-mL vial = £139.00

Cautions

see section 8.1 and notes above; cardiovascular disease; QT-interval prolongation (avoid hypokalaemia or concomitant use of drugs that prolong QT-interval); interactions: Appendix 1 (vinorelbine)

Contra-indications

see section 8.1 and notes above; with capsules previous significant surgical resection of stomach or small bowel, long-term oxygen therapy, concurrent radiotherapy if treating the liver

Hepatic impairment

reduce dose—consult product literature

Renal impairment

reduce dose if creatinine clearance less than 60 mL/minute—consult product literature

Pregnancy

avoid unless essential—teratogenicity and embryotoxicity in animal studies; manufacturer advises effective contraception during and for up to 3 months after treatment; see also Reproductive Function, p. 520

Breast-feeding

discontinue breast-feeding

Side-effects

see section 8.1 and notes above; also anorexia, diarrhoea, dyspepsia, tachycardia, hypertension, hypotension, thrombosis; oedema; insomnia; fatigue; dehydration; cutaneous reactions, sweating; less commonly increased weight, myocardial infarction, renal failure; also reported QT-interval prolongation, inappropriate anti-diuretic hormone secretion, blurred vision

Navelbine® (Fabre) *(Genus)*

Concentrate for intravenous infusion, vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.75; 5-mL vial = £139.98

Capsules, vinorelbine (as tartrate) 20 mg (brown), net price 1-cap pack = £43.98; 30 mg (pink), 1-cap pack = £85.98; 80 mg (yellow), 1-cap pack = £175.92

Label: 21, 25
Amsacrine

Amsacrine has an action and toxic effects similar to those of doxorubicin (section 8.1.2) and is given intra-venously. It is occasionally used in acute myeloid leukaemia. Side-effects include myelosuppression and mucositis; electrolytes should be monitored as fatal arrhythmias have occurred in association with hypokalaemia.

AMSACRINE

Indications see notes above
Cautions see section 8.1 and notes above; also caution in handling—irritant to skin and tissues
Hepatic impairment manufacturer advises reduce initial dose by 20–30%
Renal impairment manufacturer advises reduce initial dose by 20–30%
Pregnancy avoid (teratogenic and toxic in animal studies); may reduce fertility; see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above
Amsidine® (Goldshield) Concentrate for intravenous infusion, amsacrine 5 mg (as lactate)/mL, when reconstituted by mixing two solutions, net price 1.5-mL (75-mg) amp with 13.5-mL diluent vial = £54.08 (hosp. only)

Arsenic trioxide

Arsenic trioxide is licensed for acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy.

ARSENIC TRIOXIDE

Indications see notes above
Cautions see section 8.1; correct electrolyte abnormalities before treatment; ECG required before and during treatment—consult product literature; avoid concomitant administration with drugs causing QT interval prolongation, hypokalaemia, and hypomagnesaemia; previous treatment with anthracyclines (increased risk of QT interval prolongation); interactions: Appendix 1 (arsenic trioxide)
Hepatic impairment manufacturer advises caution—limited information available
Renal impairment manufacturer advises caution—limited information available
Pregnancy avoid (teratogenic and embryotoxic in animal studies); manufacturer advises effective contraception during treatment in men and women; see also Reproductive function, p. 520
Breast-feeding discontinue breast-feeding

Bevacizumab

Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor. It is licensed for the treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy (but see NICE guidance below). It is also licensed for first-line treatment of metastatic breast cancer in combination with paclitaxel, or docetaxel, and also for advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a (but see NICE Guidance, p. 545).

Bevacizumab, in combination with platinum-based chemotherapy, is licensed for first-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology. Bevacizumab is given by intravenous infusion.

MHRA/CHM advice

Bevacizumab and sunitinib: risk of osteonecrosis of the jaw (January 2011)
Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw. Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk. Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib. If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

NICE guidance

Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007)
- Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is not recommended for the first-line treatment of metastatic colorectal cancer;
- Cetuximab in combination with irinotecan is not recommended for the second-line or subsequent treatment of metastatic colorectal cancer after the failure of an irinotecan-containing chemotherapy regimen.
**Bexarotene**

Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. It is associated with little myelosuppression or immunosuppression. Bexarotene can cause regression of cutaneous T-cell lymphoma. The main adverse effects are hyperlipidaemia, hypothyroidism, leucopenia, headache, rash, and pruritus.

The Scottish Medicines Consortium (p. 4) has advised (November 2002) that bexarotene is recommended for restricted use as a second-line treatment for patients with advanced cutaneous T-cell lymphoma.

**Indications**

skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment

**Cautions**

see section 8.1 and notes above; hyperlipidaemia (avoid if uncontrolled), hypothyroidism (avoid if uncontrolled), hypersensitivity to retinoids; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (bexarotene)

**Contra-indications**

see section 8.1 and notes above; history of pancreatitis, hypervitaminosis A

**Hepatic impairment**

avoid

**Pregnancy**

avoid—toxicity in animal studies; effective contraception required during and for at least 6 months after treatment in women; see also Reproductive Function, p. 520

**Breast-feeding**

manufacturer advises avoid breast-feeding during and for at least 6 months after treatment

**Side-effects**

see section 8.1 and notes above

**Dose**

- Initially 300 mg/m² daily as a single dose with a meal; adjust dose according to response

**Targretin®** (Cephalon) ▼

Capsules, bexarotene 75 mg in a liquid suspension, net price 100-cap pack = £937.50

**NICE guidance**

Bortezomb monotherapy for relapsed multiple myeloma (October 2007)

Bortezomb monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) and
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.

**Bortezomib**

Bortezomib, a proteasome inhibitor, is licensed as monotherapy for the treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, bone-marrow transplantation. It is also licensed for use in combination with melphalan and prednisolone for the treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with bone marrow transplantation. Bortezomib is given by intravenous injection.

**Indications**

see notes above

**Cautions**

see section 8.1; cardiovascular disease; pulmonary disease (chest x-ray recommended before treatment—discontinue if interstitial lung disease develops); consider antiviral prophylaxis for herpes

**Hepatic impairment**

avoid

**Pregnancy**

avoid—manufacturer advises effective contraception during and for at least 1 month after treatment in men or women; see also Reproductive Function, p. 520

**Breast-feeding**

discontinue breast-feeding

**Side-effects**

see section 8.1 and notes above

**Dose**

- Initially 300 mg/m² daily as a single dose with a meal; adjust dose according to response

**Targretin®** (Cephalon) ▼

Capsules, bexarotene 75 mg in a liquid suspension, net price 100-cap pack = £937.50

**NICE guidance**

Bortezomb monotherapy for relapsed multiple myeloma (October 2007)

Bortezomb monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) and
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.
zoster infection; history of seizures; amyloidosis; risk of neuropathy—consult product literature; monitor blood-glucose concentration in patients on oral anti-diabetics; interactions: Appendix 1 (bortezomib)

Contra-indications acute diffuse infiltrative pulmonary disease; pericardial disease

Hepatic impairment manufacturer advises caution in mild to moderate impairment—consider dose reduction; avoid in severe impairment

Renal impairment no information available for creatinine clearance less than 20 mL/minute/1.73 m²

Pregnancy manufacturer advises effective contraception during and for 3 months after treatment in men or women—toxicity in animal studies; see also Reproductive Function, p. 520

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also gastrointestinal disturbances including constipation (cases of ileus reported), taste disturbance, dry mouth, decreased appetite; postural hypotension, hypertension, haematoma, phlebitis, chest pain, oedema; dyspnoea, cough; confusion, depression, insomnia, anxiety, peripheral neuropathy, paraesthesia, headache, dizziness, tremor, asthenia, fatigue; reactivation of herpes zoster infection, influenza-like symptoms; renal impairment, dysuria; dehydration, hypokalaemia, hyperglycaemia; muscle cramps, arthralgia, bone pain; blurred vision, eye pain; episaxis; urticaria, pruritus, erythema, dry skin, eczema, rash, increased sweating; less commonly syncope, seizures; reversible posterior leucoencephalopathy syndrome (discontinue treatment), toxic epidermal necrolysis, Sweet’s syndrome, and vasculitic rash also reported

Velcade® (Janssen-Cilag) ▼ the
Injection, powder for reconstitution, bortezomib (as mannitol boronic ester), net price 3.5-mg vial = £762.38

Cetuximab

Cetuximab is licensed for the treatment of metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated (but see NICE guidance below, and under Bevacizumab on p. 537). Cetuximab is also licensed, in combination with radiotherapy, for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008). Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.

NICE guidance
Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008)
Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.

NICE guidance
Cetuximab for the treatment of recurrent or metastatic squamous cell cancer of the head and neck (June 2009)
Cetuximab in combination with platinum-based chemotherapy is not recommended for the treatment of recurrent or metastatic squamous cell cancer of the head and neck.

NICE guidance
Cetuximab for the first-line treatment of metastatic colorectal cancer (August 2009)
Cetuximab in combination with fluorouracil, folinic acid and oxaliplatin is an option for the first-line treatment of metastatic colorectal cancer under the following circumstances:

- the primary tumour has been resected or is potentially operable;
- the metastatic disease is confined to the liver and is resectable;
- the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.

In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid and irinotecan can be used as an alternative.

In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.

Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be assessed for resection of liver metastases.

CETUXIMAB

Indications see notes above and product literature

Cautions cardiovascular disease, cardiopulmonary disease, pulmonary disease—discontinue if interstitial lung disease

Contra-indications KRAS mutated colorectal tumours (avoid if KRAS tumour status unknown)

Pregnancy use only if potential benefit outweighs risk—no information available; see also Reproductive Function, p. 520

Breast-feeding avoid breast-feeding during and for 2 months after treatment—no information available

Side-effects infusion-related reactions including dyspnoea, dizziness, chills, fever, and hypersensitivity reactions (possibly delayed onset) such as rash, urti-
540 8.1.5 Other antineoplastic drugs

Malignant disease and immunosuppression

Crisantaspase
Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi. It is given intramuscularly, intravenously, or subcutaneously almost exclusively in acute lymphoblastic leukaemia. Facilities for the management of anaphylaxis should be available.

DACARBAZINE
Indications see notes above
Cautions see section 8.1; caution in handling; interactions: Appendix 1 (dacarbazine)
Hepatic impairment dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment
Renal impairment dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment
Pregnancy avoid (carcinogenic and teratogenic in animal studies); ensure effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above; rarely liver necrosis due to hepatic vein thrombosis; irritant to skin and tissues

DACARBAZINE
Appendix 1 (dacarbazine)
Injection, powder for reconstitution, dacarbazine, as citrate), net price 100-mg vial = £5.05; 200-mg vial = £7.16; 500-mg vial = £16.50; 600-mg vial = £22.50; 1-g vial = £31.80

TEMZOLOMIDE
Indications see notes above
Cautions see section 8.1; interactions: Appendix 1 (temozolomide)
Hepatic impairment use with caution in severe impairment—no information available
Renal impairment manufacturer advises caution—no information available
Pregnancy avoid (teratogenic and embryotoxic in animal studies); manufacturer advises adequate contraception during treatment; men should avoid fathering a child during and for at least 6 months after treatment; see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1
Dose
• Consult product literature; CHILD under 3 years not recommended

NICE guidance
Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001)
Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy.

NICE guidance
Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007)
Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1. Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma only for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres.

540 8.1.5 Other antineoplastic drugs

Malignant disease and immunosuppression
Hydroxyurea

Hydroxyurea is an orally active drug used mainly in the treatment of chronic myeloid leukaemia. It is also licensed for the treatment of cancer of the cervix in conjunction with radiotherapy. It is occasionally used for polycythaemia (the usual treatment is venesection). Myelosuppression, nausea, and skin reactions are the most common toxic effects.

**HYDROXYCARBAMIDE**

(Hydroxyurea)

**Indications** see notes above; sickle-cell disease (section 9.1.3)

**Cautions** see section 8.1 and notes above; interactions: Appendix 1 (hydroxyurea)

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** avoid (teratogenic in animal studies)

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- 20–30 mg/kg daily or 80 mg/kg every third day

**Hydroxyurea**

(Non-proprietary)

**Capsules**, hydroxyurea 500 mg, net price 100-cap pack = £10.47

**Hydrea**

(Squibb)

**Capsules**, pink/green, hydroxyurea 500 mg, net price 100-cap pack = £10.47

**Mitotane**

Mitotane is licensed for the symptomatic treatment of advanced or inoperable adrenocortical carcinoma. It selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy (section 6.3.1); the dose of glucocorticoid should be increased in case of shock, trauma, or infection.

Gastro-intestinal side-effects such as anorexia, nausea, and vomiting, and endocrine side-effects, such as hypogonadism and thyroid disorders, are very common with mitotane; neurotoxicity occurs in many patients.

**MITOTANE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; risk of accumulation in overweight patients; monitor plasma-mitotane concentration—consult product literature; interactions: Appendix 1 (mitotane)

**Driving** CNS effects may affect performance of skilled tasks (e.g. driving)

**Counselling** Warn patient to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency)

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

**Pregnancy** manufacturer advises avoid—women of childbearing age should use effective contraception during and after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, epigastric discomfort), anorexia, liver disorders; hypercholesterolaemia, hyperglycæmia, ataxia, confusion, asthenia, myasthenia, paraesthesia, drowsiness, neuropathy, cognitive impairment, movement disorder, dizziness, headache; gynaecomastia; prolonged bleeding time, leucopenia, thrombocytopenia, anaemia; rash; rarely hypersalivation, hypertension, postural hypotension, flushing, pyrexia, haematuria, proteinuria, haemorrhagic cystitis, hypouricaemia, visual disturbances, and ocular disorders

**Dose**

- **ADULT** over 18 years, initially 2–3 g daily, (up to 6 g daily in severe illness) in 2–3 divided doses, adjusted according to plasma-mitotane concentration; reduce dose or interrupt treatment if signs of toxicity; discontinue if inadequate response after 3 months

**Note** Plasma-mitotane concentration for optimum response 14–20 mg/litre

**Lysodren**

(HRA Pharma)

**Tablets**, scored, mitotane 500 mg, net price 100-tab pack = £590.97. Label: 2, 10, 21, counselling, driving, adrenal suppression

**Panitumumab**

Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR). It is indicated as monotherapy for the treatment of EGFR expressing metastatic colorectal cancer with non-mutated *KRAS* gene after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens. Panitumumab is given by intravenous infusion.

**PANITUMUMAB**

**Indications** see notes above

**Cautions** monitor for dermatological reactions (may require temporary or permanent discontinuation—consult product literature); pulmonary disease—discontinue if pneumonitis or lung infiltrates occur; monitor for hypomagnesaemia and hypocalcaemia

**Contra-indications** intestinal pulmonary disease

**Pregnancy** avoid (toxicity in animal studies); manufacturer advises effective contraception

**Breast-feeding** manufacturer advises avoid—breastfeeding during and for 3 months after treatment

**Side-effects** see section 8.1; also infusion-related reactions including hypertension, hypotension, tachycardia, and severe hypersensitivity reactions (possibly delayed onset); diarrhoea, abdominal pain, constipation, dry mouth and nose, dyspnoea, cough,
embolism; fatigue, dizziness, headache; hypomagnesaemia, hypocalcaemia, hypokalaemia, dehydration; ocular disorders (including conjunctivitis, increased lacrimation, dry eyes, ocular hyperaemia); skin reactions (including rash, erythema, pruri tus, dry skin, acne, hand-foot syndrome and exfoliation), mucosal inflammation, hypertrichosis, and nail disorders.

**Vectorix**® (Amgen) ▼ 1/58
Concentrate for intravenous infusion, panitumumab
20 mg/mL, net price 5-mL vial = £379.29, 20-mL vial = £1517.16
Electrolytes Na⁺ 0.75 mmol/vial

**Pentostatin**

Pentostatin is active in hairy cell leukaemia. It is given intravenously on alternate weeks and can induced prolonged complete remission. It can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity. Its use should be confined to specialist centres.

**Indications** see notes above

**Cautions** see section 8.1 and notes above; interactions: Appendix 1 (pentostatin)

**Hepatic impairment** manufacturer advises caution—limited information available

**Renal impairment** avoid if creatinine clearance less than 60 mL/minute

**Pregnancy** avoid if teratogenic in animal studies; manufacturer advises that men should not father children during and for 6 months after treatment; see also Reproductive Function, p. 520

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Nipent**® (Hospira) ▼ 1/56
Injection, powder for reconstitution, pentostatin, net price 10-mg vial = £863.78

**Platinum compounds**

Carboplatin is widely used in the treatment of advanced ovarian cancer and lung cancer (particularly the small cell type). It is given intravenously. The dose of carboplatin is determined according to renal function rather than body surface area. Carboplatin can be given on an outpatient basis and is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

Cisplatin is used alone or in combination for the treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (but carboplatin is preferred for ovarian cancer). It is given intravenously. Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting. Cisplatin is toxic, causing nephrotoxicity (monitoring of renal function is essential), ototoxicity, peripheral neuropathy, hypomagnesaemia and myelosuppression. It is, however, increasingly given in a day-care setting.

Oxaliplatin is licensed in combination with fluorouracil and folinic acid, for the treatment of metastatic colorectal cancer and as adjuvant treatment of colon cancer after resection of the primary tumour; it is given by intravenous infusion. Neurotoxic side-effects (including sensory peripheral neuropathy) are dose limiting. Other side-effects include gastro-intestinal disturbances, ototoxicity, and myelosuppression. If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.
8.1.5 Other antineoplastic drugs

Porfimer sodium and temoporfin

Porfimer sodium and temoporfin are used in the photodynamic treatment of various tumours. The drugs accumulate in malignant tissue and are activated by laser light to produce a cytotoxic effect.

Porfimer sodium is licensed for photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer. Temoporfin is licensed for photodynamic therapy of advanced head and neck cancer.

CARBOPLATIN

Indications see notes above
Cautions see section 8.1 and notes above; interactions: Appendix 1 (platinum compounds)
Renal impairment reduce dose and monitor haematological parameters and renal function; avoid if creatinine clearance less than 30 mL/minute
Pregnancy avoid (teratogenic and embryotoxic in animal studies); see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above

CISPLATIN

Indications see notes above
Cautions see section 8.1 and notes above; interactions: Appendix 1 (platinum compounds)
Renal impairment avoid if possible; nephrotoxic
Pregnancy avoid (teratogenic and toxic in animal studies); see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above

OXALIPLATIN

Indications metastatic colorectal cancer in combination with fluorouracil and folic acid; colon cancer—see notes above
Cautions see section 8.1 and notes above; interactions: Appendix 1 (platinum compounds)
Contra-indications see section 8.1; peripheral neuropathy with functional impairment
Renal impairment manufacturer advises avoid if creatinine clearance less than 30 mL/minute
Pregnancy manufacturer advises avoid—toxicity in animal studies; effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men; see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above

Oxaliplatin (Non-proprietary) (M)
Injection, oxaliplatin 10 mg/mL, net price 5-mL vial = £22.04, 15-mL vial = £56.92, 45-mL vial = £168.85, 60-mL vial = £260.00

TEMOPORFIN

Indications advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments
Cautions see section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days
Contra-indications see section 8.1; tracheo-oesophageal or broncho-oesophageal fistula; acute porphyria (section 9.8.2)
Hepatic impairment avoid in severe impairment
Pregnancy manufacturer advises avoid unless essential
Breast-feeding no information available—manufacturer advises avoid
Side-effects see section 8.1; photosensitivity (see Cautions above—sunscreens offer no protection), constipation

Photofrin® (Axcan) (M)
Injection, powder for reconstitution, porfimer sodium, net price 15-mg vial = £154.00; 75-mg vial = £770.00

Foscan® (BioIntec) ▼ (M)
Injection, temoporfin 1 mg/mL, net price 1-mL vial = £900.00, 3-mL vial = £1800.00, 6-mL vial = £3400.00

Malignant disease and immunosuppression
8 Malignant disease and immunosuppression

The Scottish Medicines Consortium (p. 4) has advised (April 2007) that the use of dasatinib (Sprycel®) in NHS Scotland is restricted to patients in the chronic phase of chronic myeloid leukaemia.

**Procarbazine**

Procarbazine is most often used in Hodgkin’s disease. It is given by mouth. Toxic effects include nausea, myelosuppression, and a hypersensitivity rash. Preventing further use of this drug requires dietary restriction, which is rarely considered necessary. Alcohol ingestion may cause a disulfiram-like reaction.

**Procarbazine**

**Indications**

- see notes above

**Cautions**

- see section 8.1 and notes above; cardiovascular or cerebrovascular disease; phaeochromocytoma; epilepsy; interactions: Appendix 1 (procarbazine)

**Hepatic impairment**

- caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment**

- caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy**

- avoid (teratogenic in animal studies and isolated reports in humans); see also Reproductive Function, p. 520

**Breast-feeding**

- discontinue breast-feeding

**Side-effects**

- see section 8.1 and notes above; also loss of appetite; jaundice also reported

Procarbazine (Non-proprietary) 50 mg

Capsules, procarbazine (as hydrochloride) 50 mg, net price 50-cap pack = £199.60. Label: 4

**Protein kinase inhibitors**

Dasatinib, erlotinib, everolimus, gefitinib, imatinib, lapa-tinib, nilotinib, pazopanib, sorafenib, sunitinib, and temsirolimus are protein kinase inhibitors.

**Dasatinib**, a tyrosine kinase inhibitor, is licensed for the treatment of chronic myeloid leukaemia in those who have resistance to or intolerance of previous therapy, including imatinib. It is also licensed for acute lymphoblastic leukaemia (Philadelphia chromosome positive) in those who have resistance to or intolerance of previous therapy.

The Scottish Medicines Consortium (p. 4) has advised (April 2007) that the use of dasatinib (Sprycel®) in NHS Scotland is restricted to patients in the chronic phase of chronic myeloid leukaemia.

**Erlotinib**, a tyrosine kinase inhibitor, is licensed in combination with gemcitabine for the treatment of metastatic pancreatic cancer. It is also licensed for the treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy and as monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy.

**Protein kinase inhibitors**

The Scottish Medicines Consortium (p. 4) has advised (May 2006) that erlotinib (Tarceva®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung cancer, after failure of at least one chemotherapy regimen. Erlotinib is restricted to use in patients who would otherwise be eligible for treatment with docetaxel monotherapy.

**Protein kinase inhibitors**

The Scottish Medicines Consortium (p. 4) has advised (October 2003) that imatinib (Glivec®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

**NICE guidance**

- **Erlotinib for non-small-cell lung cancer** (November 2008)

Erlotinib is recommended, as an alternative to docetaxel, as second-line treatment for locally advanced or metastatic non-small-cell lung cancer after failure of previous chemotherapy, on the basis that it is provided by the manufacturer at an overall treatment cost equal to that of docetaxel. Erlotinib is not recommended in patients for whom docetaxel is unsuitable or as third-line treatment after docetaxel.

**Everolimus**, a protein kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma when the disease has progressed despite treatment with vascular endothelial growth factor-targeted therapy.

**Gefitinib**, a tyrosine kinase inhibitor, is licensed for the treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor.

**Imatinib**, a tyrosine kinase inhibitor, is licensed for the treatment of newly diagnosed chronic myeloid leukaemia where bone marrow transplantation is not considered first-line treatment, and for chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis (see NICE guidance below). It is also licensed for the treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST), and as adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse. Imatinib is licensed for the treatment of newly diagnosed acute lymphoblastic leukaemia in combination with other chemotherapy, and as monotherapy for relapsed or refractory acute lymphoblastic leukaemia. Imatinib is also licensed for the treatment of unresectable dermatofibrosarcoma protuberos and for patients with recurrent or metastatic dermatofibrosarcoma protuberos who cannot have surgery. Imatinib is also licensed for the treatment of myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement and for the treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia.

The Scottish Medicines Consortium (p. 4) has advised (March 2002) that imatinib (Glivec®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

**NICE guidance**

- **Imatinib for chronic myeloid leukaemia** (October 2003)

Imatinib is recommended as first-line treatment for Philadelphia-chromosome-positive chronic myeloid leukaemia in the chronic phase and as an option for patients presenting in the accelerated phase or with blast crisis, provided that imatinib has not been used previously. Where imatinib has failed to stop disease progression from chronic phase to accelerated phase or to blast crisis, continued use is recommended only as part of further clinical study.
Lapatinib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic breast cancer in patients with tumors that overexpress human epidermal growth factor receptor-2 (HER2). It is indicated, in combination with capecitabine, for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab, or for postmenopausal women in combination with an aromatase inhibitor section 8.3.4.1.

Nilotinib, a tyrosine kinase inhibitor, is licensed for the treatment of chronic myeloid leukaemia in those who have resistance to or intolerance of previous therapy, including imatinib.

The Scottish Medicines Consortium (p. 4) has advised (February 2008) that nilotinib (Tasigna®) is accepted for restricted use within NHS Scotland for the treatment of chronic-phase chronic myeloid leukaemia in adults resistant to or intolerant of at least one previous therapy, including imatinib.

Pazopanib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma, as first-line treatment and for the treatment of patients who have had previous treatment with cytokine therapy for advanced disease.

Sorafenib, an inhibitor of multiple kinases, is licensed for the treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is contra-indicated (but see NICE Guidance below). It is also licensed for the treatment of hepatocellular carcinoma.

Temsirolimus is a protein kinase inhibitor licensed for the first-line treatment of advanced renal cell carcinoma (see NICE Guidance above), and for the treatment of relapsed or refractory mantle cell lymphoma. Hyper-sensitivity reactions, including some life-threatening and rare fatal reactions, are associated with temsirolimus therapy, usually during administration of the first dose. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.
DASATINIB

Indications  see notes above

Cautions  see section 8.1; susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment); interactions: Appendix 1 (dasatinib)

Hepatic impairment  manufacturer advises caution in hepatic impairment

Pregnancy  manufacturer advises avoid—no information available

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1; also diarrhoea, anorexia, weight changes, abdominal pain, taste disturbance, constipation, dyspepsia, colitis, gastritis; arrhythmias, congestive heart failure, hypertension, chest pain, flushing, haemorrhage (including gastro-intestinal and CNS haemorrhage), palpitation; dyspnoea, pulmonary hypertension, cough, oedema (more common in patients over 65 years old), pleural effusion; dyspepsia, diarrhea, headache, insomnia, nervousness, vertigo; influenza-like symptoms; musculoskeletal pain; visual disturbances; tinnitus; acne, dry skin, sweating, pruritus, dermatitis, urticaria; disturbances; tinnitus; acne, dry skin, sweating, pruritus, dermatitis, urticaria; less commonly, hypertenison, transient ischaemic attack; thrombophlebitis, syncope, asthma, seizures, amnesia, tremor, drowsiness, gynaecomastia, irregular menstruation, urinary frequency, proteinuria, hypocalcaemia, rhabdomyolysis, hypersensitivity reactions (including erythema nodosum), photosensitivity, and pigmentation and nail disorders; rarely cor pulmonale; thrombosis and interstitial lung disease also reported

Dose  ● Chronic phase chronic myeloid leukaemia, ADULT over 18 years 100 mg once daily; increased if necessary to max. 140 mg once daily
  ● Accelerated and blast phase chronic myeloid leukaemia, acute lymphoblastic leukaemia, ADULT over 18 years 140 mg once daily, increased if necessary to max. 180 mg once daily

Sprycel® (Bristol-Myers Squibb) Tablets, f/c, dasatinib (as monohydrate) 20 mg, net price 60-tab pack = £1252.48; 50 mg, 60-tab pack = £2504.96; 70 mg, 60-tab pack = £2504.96; 100 mg, 30-tab pack = £2504.96. Label: 25

ERLOTINIB

Indications  see notes above

Cautions  see section 8.1; pre-existing liver disease or concomitant use with hepatotoxic drugs—monitor liver function; dose adjustment may be necessary if smoking started or stopped during treatment; interactions: Appendix 1 (erlotinib)

Hepatic impairment  manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment  manufacturer advises avoid in severe impairment

Pregnancy  manufacturer advises avoid—toxicity in animal studies; effective contraception required during treatment; see also Reproductive Function, p. 520

Breast-feeding  manufacturer advises avoid—no information available

Side-effects  see section 8.1 and notes above; also diarrhoea, abdominal pain, dyspepsia, flatulence; anorexia, depression, neuropathy, headache; fatigue, rigor; conjunctivitis; pruritus, dry skin; less commonly gastro-intestinal perforation, interstitial lung disease—discontinue if unexplained symptoms such as dyspnoea, cough or fever occur; eyelash changes; rarely hepatic failure; very rarely corneal perforation or ulceration, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose  ● Non-small cell lung cancer, 150 mg once daily
  ● Pancreatic cancer, 100 mg once daily in combination with gemcitabine

Tarceva® (Roche) Tablets, f/c, white-yellow, erlotinib (as hydrochloride) 25 mg, net price 30-tab pack = £378.33; 100 mg, 30-tab pack = £1524.14; 150 mg, 30-tab pack = £1631.53. Label: 23

EVEROLIMUS

Indications  see notes above

Cautions  see section 8.1; monitor blood-glucose concentration before treatment and periodically thereafter; reduce dose or discontinue if severe side-effects occur—consult product literature; interactions: Appendix 1 (everolimus)

Pneumonitis  Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur

Hepatic impairment  reduce dose to 5 mg daily in moderate impairment; avoid in severe impairment—no information available

Pregnancy  manufacturer advises avoid (toxicity in animal studies); effective contraception must be used; see also Reproductive Function, p. 520

Breast-feeding  manufacturer advises avoid

Side-effects  see section 8.1; also diarrhoea, dry mouth, abdominal pain, dysphagia, anorexia, taste disturbance; chest pain, hypertension, hyperlipidaemia, hypercholesterolaemia, peripheral oedema; pneumonitis (including interstitial lung disease); asthenia, fatigue, headache, insomnia; increased susceptibility to infections (including pneumonia, aspergillosis, and candidiasis); hyperglycaemia, dehydration; eyelid oedema; epistaxis; skin and nail disorders (including hand-foot syndrome); less commonly congestive heart failure and impaired wound healing; hepatitis B reactivation and haemorrhage also reported

Dose  ● ADULT over 18 years, 10 mg once daily

Afinitor® (Novartis) Tablets, white-yellow, everolimus, 5 mg, net price 30-tab pack = £2250.00; 10 mg, 30-tab pack = £2970.00. Label: 25, counselling, pneumonitis

GEFITINIB

Indications  see notes above

Cautions  monitor liver function—consider discontinuing if severe changes in liver function occur; monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed; patients should seek immediate medical advice if they experience any ocular symptoms; interactions: Appendix 1 (gefitinib)
Hepatic impairment  manufacturer advises caution in moderate to severe impairment due to cirrhosis
Renal impairment  manufacturer advises caution if creatinine clearance less than 20 mL/minute
Pregnancy  manufacturer advises avoid unless essential—toxicity in animal studies; see also Reproductive Function, p. 520
Breast-feeding  discontinue breast-feeding
Side-effects  see section 8.1; also anorexia, diarrhoea, constipation, mouth; epistaxis, interstitial lung disease; continue if confirmed; asthenia; pyrexia; haematuria, proteinuria; dry eye, conjunctivitis, blepharitis; nail disorder, skin reactions (including dry skin, rash, acne, and pruritus); less commonly pancreatitis, corneal erosion; rarely hepatic, toxic epidermal necrolysis
Dose
• ADULT over 18 years, 250 mg once daily

Iressa® (AstraZeneca) ▼Tablets, f/c, brown, geftinib 250 mg, net price 30-tab pack = £2167.71

IMATINIB

Indications  see notes above
Cautions  see section 8.1; cardiac disease; monitor for fluid retention; monitor liver function; interactions: Appendix (imatinib)
Hepatic impairment  max. 400 mg daily; reduce dose further if not tolerated
Renal impairment  max. starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated
Pregnancy  manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment; see also Reproductive Function, p. 520
Breast-feeding  discontinue breast-feeding
Side-effects  see section 8.1; also abdominal pain, appetite changes, constipation, diarrhoea, flatulence, gastro-oesophageal reflux, taste disturbance, weight changes, dry mouth, oedema (including pulmonary oedema, pleural effusion, and ascites), flushing, haemorrhage: cough, dyspnoea; dizziness, headache, insomnia, hypoaesthesia, paraesthesia, fatigue; influenza-like symptoms; cramps, arthralgia; visual disturbances, increased lacrimation, conjunctivitis, dry eyes; epistaxis; dry skin, sweating, rash, pruritus, photosensitivity; less commonly gastric ulceration, pancreatitis, hepatic dysfunction (rarely hepatic failure, hepatic necrosis), dysphagia, heart failure, tachycardia, palpitation, syncope, hypertension, hypotension, cold extremities, cough, acute respiratory failure, depression, drowsiness, anxiety, peripheral neuropathy, tremor, migraine, impaired memory, vertigo, gynaecomastia, menorrhagia, irregular menstruation, sexual dysfunction, electrolyte disturbances, renal failure, urinary frequency, gout, tinnitus, hearing loss; skin hyperpigmentation; rarely intestinal obstruction, gastro-intestinal perforation, inflammatory bowel disease, arthralgia, atrial fibrillation, myocardial infarction, angina, pulmonary fibrosis, pulmonary hypertension, increased intracranial pressure, convulsions, confusion, haemolytic anaemia, rhombomyllosis, myopathy, aseptic necrosis of bone, cataract, glaucoma, angioedema, exfoliative dermatitis, and Stevens-Johnson syndrome
Dose
• Chronic phase chronic myeloid leukaemia, ADULT 400 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses); CHILD (chronic and advanced phase) 2–18 years 340 mg/m2 (max. 800 mg) daily (in 1–2 divided doses), increased to 570 mg/m2 (max. 800 mg) daily if necessary (consult product literature)
• Accelerated phase and blast crisis chronic myeloid leukaemia, ADULT 600 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses)
• Acute lymphoblastic leukaemia, ADULT 600 mg once daily
• Gastro-intestinal stromal tumours, ADULT 400 mg once daily
• Myelodysplastic/myeloproliferative diseases, ADULT 400 mg once daily
• Advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia, ADULT 100–400 mg once daily

Glivec® (Novartis) ▼Tablets, f/c, imatinib (as mesilate) 100 mg (yellow-brown, scored), net price 60-tab pack = £802.04; 400 mg (yellow), 30-tab pack = £1604.08. Label: 21, 27 Counselling Tablets may be dispersed in water or apple juice

LAPATINIB

Indications  see notes above
Cautions  see section 8.1; low gastric pH (reduced absorption); susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT-interval and electrolyte disturbances); monitor left ventricular function; monitor for pulmonary toxicity; monitor liver function before treatment and at monthly intervals; interactions: Appendix (lapatinib)
Hepatic impairment  caution in moderate to severe impairment—metabolism reduced
Renal impairment  caution in severe impairment—no information available
Pregnancy  avoid unless potential benefit outweighs risk—toxicity in animal studies; see also Reproductive Function, p. 520
Breast-feeding  discontinue breast-feeding
Side-effects  see section 8.1; anorexia, diarrhoea (treat promptly), decreased left ventricular ejection fraction, cardiac failure (fatal cases reported), malaise, rash, nail disorders, hyperbilirubinaemia, hepatotoxicity (discontinue permanently if severe); less commonly interstitial lung disease; respiratory failure (including fatal cases) also reported
Dose
• In combination with capecitabine, ADULT over 18 years, 1.25 g once daily
• In combination with an aromatase inhibitor, ADULT over 18 years, 1.5 g once daily Counselling Always take at the same time in relation to food: either one hour before or one hour after food. Patients should report unexpected changes in bowel habit

Tyverb® (GSK) ▼Tablets, yellow, f/c, lapatinib 250 mg, net price 70-tab pack = £804.30, 84 tab-pack = £965.16. Counselling, administration
NILOTINIB

Indications  see notes above

Cautions  see section 8.1; history of pancreatitis; susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); Interactions: Appendix 1 (nilotinib)

Hepatic impairment  manufacturer advises caution

Pregnancy  manufacturer advises avoid unless potential benefit outweighs risk— toxicity in animal studies; effective contraception advised during treatment; see also Reproductive Function, p. 520

Breast-feeding  manufacturer advises avoid—present in milk in animal studies

Side-effects  see section 8.1; also abdominal pain, constipation, diarhoea, dyspepsia, flatulence, anorexia, weight changes; palpitation, QT-interval prolongation, hypertension, oedema, flushing; dyspnoea, cough, dysphonia; headache, fatigue, asthenia, dizziness, paraesthesia, insomnia, vertigo; hypomagnesemia, hyperkalaemia, blood glucose changes; bone pain, arthralgia, muscle spasm; urticaria, erythema, hyperhidrosis, dry skin, rash, pruritus; less commonly muscular weakness, back pain, leg pain, myalgia, tinnitus, rash, pruritus; less commonly hyperglycaemia, ketonuria, hyperuricemia, acne, pleural effusion, interstitial lung disease, migraine, hypoesthesia, hyperaesthesia, depression, anxiety, tremor, influenza-like symptoms, hyperthyroidism, breast pain, gynaecomastia, erectile dysfunction, dysuria, urinary frequency, hypokalaemia, hyponatraemia, hypocalcaemia, hyponatraemia, hyperphosphatasaemia, dehydration, decreased visual acuity, conjunctivitis, dry eyes, epistaxis, and ecchymosis

Dose  Adult  over 18 years, 400 mg twice daily

Tasigna® (Novartis)  ▼  [21]

Capsules, yellow, nilotinib (as hydrochloride monohydrate) 200 mg, net price 112-cap pack = £2432.85. Label: 23, 25, 27

PAZOPANIB

Indications  see notes above

Cautions  see section 8.1; monitor liver function before treatment and at least monthly for the first 4 months—consult product literature; control blood pressure before initiating and monitor blood pressure throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite antihypertensive therapy); susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); patients at risk of myocardial infarction, ischaemic stroke or transient ischaemic attack, cardiac disease; increased risk of haemorrhage; increased risk of gastrointestinal perforation or fistulas; discontinue treatment 7 days before elective surgery and restart only if adequate wound healing; monitor thyroid function; monitor for proteinuria; Interactions: Appendix 1 (pazopanib)

Contra-indications  cerebral or clinically significant gastrointestinal haemorrhage or haemoptysis in the past 6 months

Contra-indications  see section 8.1; monitor liver function before

Cautions  see notes above

Indications  see notes above

Breast-feeding  manufacturer advises caution in major surgical procedures; cardiac ischaemia; interactions: Appendix 1 (sorafenib)

Hepatic impairment  manufacturer advises caution in severe impairment—no information available

Pregnancy  manufacturer advises avoid unless essential— toxicity in animal studies; see also Reproductive Function, p. 520

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1; also diarrhoea, constipation, dyspepsia, dysphagia, anorexia, hypertension, haemorrhage, flushing, hoarseness, fatigue, asthenia, depression, peripheral neuropathy, fever, erectile dysfunction, renal failure, hypophosphataemia, arthralgia, myalgia, tinnitus, rash, pruritus, erythema, dry skin, desquamation, acne, hand-foot skin reaction; less commonly gastro-intestinal perforations, myocardial infarction, congestive heart failure, hypertensive crisis, reversible posterior leucoencephalopathy, thyroid dysfunction, and Stevens-Johnson syndrome

Dose  Adult  over 18 years, 400 mg twice daily

SORAFENIB

Indications  see notes above

Cautions  major surgical procedures; cardiac ischaemia; interactions: Appendix 1 (sorafenib)

Hepatic impairment  manufacturer advises caution in severe impairment—no information available

Pregnancy  manufacturer advises avoid unless essential— toxicity in animal studies; see also Reproductive Function, p. 520

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1; also diarrhoea, constipation, dyspepsia, dysphagia, anorexia, hypertension, haemorrhage, flushing, hoarseness, fatigue, asthenia, depression, peripheral neuropathy, fever, erectile dysfunction, renal failure, hypophosphataemia, arthralgia, myalgia, tinnitus, rash, pruritus, erythema, dry skin, desquamation, acne, hand-foot skin reaction; less commonly gastro-intestinal perforations, myocardial infarction, congestive heart failure, hypertensive crisis, reversible posterior leucoencephalopathy, thyroid dysfunction, and Stevens-Johnson syndrome

Dose  Adult  over 18 years, 400 mg twice daily

Nexavar® (Bayer Schering)  ▼  [24]

Tablets, f/c, red, sorafenib (as tosylate) 200 mg, net price 112-tab pack = £2980.47 Label: 23

8.1.5 Other antineoplastic drugs

SUNITINIB

Indications: see notes above

Cautions: see section 8.1; cardiovascular disease—discontinue if congestive heart failure develops; susceptibility to QT-interval prolongation; hypertension; increased risk of bleeding; monitor for thyroid dysfunction; consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw); see MHRA/CHM advice, p. 537; Interactions: Appendix 1 (sunitinib)

Pregnancy: manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies; effective contraception required during treatment; see also Reproductive Function, p. 520

Breast-feeding: discontinue breast-feeding

Side-effects: see section 8.1; abdominal pain, nausea, vomiting, constipation, altered taste, altered sense of smell, cough, fatigue, dizziness, headache, insomnia, peripheral neuropathy, arthralgia, myalgia, increased lactic acidemia, epistaxis, skin, hair, and urine discoloration, hand-foot syndrome, dry skin, and rash; gastro-intestinal perforation; fistula formation; interupt treatment if occurs; pancreatitis, osteonecrosis of the jaw; see MHRA/CHM advice, p. 537; hepatic failure, proteinuria (rarely nephrotic syndrome) and seizures reported

Dose: 50 mg daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle; adjust dose in steps of 12.5 mg according to tolerability; dose range 25–75 mg daily

SU
cent® (Pfizer) Capsules, sunitinib (as malate) 12.5 mg (orange), net price 28-cap pack = £784.70; 25 mg (caramel/orange), 28-cap pack = £1569.40; 50 mg (caramel), 28-cap pack = £3138.80. Label: 14

TEMSIROLIMUS

Indications: see notes above

Cautions: see notes above; monitor respiratory function; monitor blood lipids; Interactions: Appendix 1 (temsirolimus)

Hepatic impairment: use with caution; in renal cell carcinoma, reduce dose in severe impairment (consult product literature); in mantle cell lymphoma, avoid in moderate or severe impairment

Renal impairment: manufacturer advises caution in severe impairment—no information available

Pregnancy: manufacturer advises avoid (toxicity in animal studies); ensure effective contraception during treatment in men and women; see also Reproductive Function, p. 520

Breast-feeding: manufacturer advises discontinue breast-feeding

Side-effects: see section 8.1; abdominal pain, diarrhea, anorexia, taste disturbance, gastrointestinal haemorrhage, bowel perforation, dysphagia, hypertension, oedema, thrombosis, thrombophlebitis; cough, dyspnoea, chest pain, interstitial lung disease; hypersensitivity reactions (see notes above); insomnia, anxiety, depression, drowsiness, paraesthesia, dizziness, asthenia; increased susceptibility to infection (including urinary-tract infection and pneumonia), pyrexia; hyperglycaemia; renal failure; hypophosphataemia, hypokalaemia, hypercholesterolaemia, hyperlipidaemia; myalgia, arthralgia; eye disorders; rhinitis, epistaxis; skin disorders (including rash and acne); folliculitis, impaired wound healing; less commonly intracerebral bleeding

Torisel® (Wyeth) Infusion, temsirolimus 25 mg/mL, net price 1.2-mL amp (with diluent) = £620.00

Excipients: include propylene glycol and ethanol

Taxanes

Paclitaxel is a member of the taxane group of drugs. It is given by intravenous infusion. Paclitaxel given with carboplatin or cisplatin is used for the treatment of ovarian cancer (see NICE guidance p. 542); the combination is also considered appropriate for women whose ovarian cancer is initially considered inoperable. Paclitaxel is also licensed for the secondary treatment of metastatic breast cancer. There is limited evidence to support its use in non-small cell lung cancer. Routine premedication with a corticosteroid, an antihistamine and a histamine H₂-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication, although more commonly only bradycardia or asymptomatic hypotension occur.

Other side-effects of paclitaxel include myelosuppression, peripheral neuropathy, and cardiac conduction defects with arrhythmias (which are nearly always asymptomatic). It also causes alopecia and muscle pain; nausea and vomiting is mild to moderate.

Docetaxel is licensed for use in locally advanced or metastatic breast cancer and non-small cell lung cancer resistant to other cytotoxic drugs or for initial chemotherapy in combination with other cytotoxic drugs. It is also licensed for hormone-resistant prostate cancer; for use with other cytotoxic drugs for gastric adenocarcinoma and head and neck cancer, and for adjuvant treatment of operable node-negative and operable node-positive breast cancer. Its side-effects are similar to those of paclitaxel but persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment; hypersensitivity reactions also occur. Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

For the role of taxanes in the treatment of breast cancer, see section 8.3.4.1.

The Scottish Medicines Consortium (p. 4) has advised that docetaxel (Taxotere®) in combination with cisplatin and 5-fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable (May 2007) and resectable (June 2008) locally advanced squamous cell carcinoma of the head and neck.

NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer) See p. 542
8 Malignant disease and immunosuppression

DOCETAXEL

Indications  adjuvant treatment of operable node-positive and operable node-negative breast cancer, in combination with doxorubicin and cyclophosphamide; with doxorubicin for initial chemotherapy of locally advanced or metastatic breast cancer; mono-therapy for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed; with capcitabine for locally advanced or metastatic breast cancer where first-line chemotherapy has failed; with cisplatin for unresectable, locally advanced or metastatic non-small cell lung cancer; with prednisolone for hormone-refractory metastatic prostate cancer; with capecitabine for locally advanced squamous cell carcinoma of the head and neck

Cautions  see section 8.1 and notes above; avoid in severe impairment

Hepatic impairment  monitor liver function—reduce dose according to liver enzymes; avoid in severe impairment

Pregnancy  avoid (toxicity and reduced fertility in animal studies); manufacturer advises effective contraception during and for at least 3 months after treatment; see also Reproductive Function, p. 520

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1 and notes above

Docetaxel (Non-proprietary)  In infusion, docetaxel 10 mg/mL, net price 2-mL vial = £162.75, 8-mL vial = £534.75, 16-mL vial = £1069.50

Taxotere® (Sanofi-Aventis)  In infusion, docetaxel 20 mg/mL, net price 1-mL vial = £162.75, 4-mL vial = £534.75, 8-mL vial = £1069.50 (hosp. only)

Note  Contains ethanol

PACLITAXEL

Indications  ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin; metastatic ovarian cancer where platinum-containing therapy has failed; locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate); adjuvant treatment of node-positive breast cancer following treatment with anthra-cycline and cyclophosphamide; non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate; advanced AIDS-related Kaposi’s sarcoma where liposomal anthracycline therapy has failed

Cautions  see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (paclitaxel)

Contra-indications  see section 8.1 and notes above

Hepatic impairment  avoid in severe impairment

Pregnancy  avoid (toxicity in animal studies); ensure effective contraception during and for at least 6 months after treatment in men or women; see also Reproductive Function, p. 520

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1 and notes above

Paclitaxel (Non-proprietary)  In infusion, paclitaxel 6 mg/mL, net price 5-mL vial = £66.85, 16.7-mL vial = £200.35, 25-mL vial = £300.52, 50-mL vial = £601.03

Excipients include polysorbate 80 (risk of anaphylaxis, see Excipients, p. 2)

Abraxane® (Abraxis)  Intravenous infusion, powder for reconstitution, paclitaxel, net price 100-mg vial = £246.00

Electrolytes  Contains approx. 18.5 mmol Na+/dose

Topotecan  (Bristol-Myers Squibb)  In infusion, paclitaxel 6 mg/mL, net price 5-mL vial = £116.05, 16.7-mL vial = £347.82, 25-mL vial = £521.73, 50-mL vial = £1043.46 (hosp. only)

Excipients include polysorbate 80 (risk of anaphylaxis, see Excipients, p. 2)

Topoisomerase 1 inhibitors

Irinotecan and topotecan inhibit topoisomerase 1, an enzyme involved in DNA replication.

Irinotecan  is licensed for metastatic colorectal cancer in combination with fluorouracil and folic acid or as monotherapy when treatment containing fluorouracil has failed. It is also licensed in combination with cetuximab for the treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan. Irinotecan is also licensed in combination with bevacizumab for the first-line treatment of metastatic carcinoma of the colon or rectum. Irinotecan is also licensed in combination with capcitabine with or without bevacizumab for the first-line treatment of metastatic colorectal carcinoma. Irinotecan is given by intravenous infusion.

NICE guidance (irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer)  See p. 542

Topotecan  is given by intravenous infusion or orally in relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate. Topotecan injection is also licensed for metastatic ovarian cancer when first-line or subsequent treatment has failed. Topotecan injection is licensed in combination with cisplatin for treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease.

In addition to dose-limiting myelosuppression, side-effects of irinotecan and topotecan include gastro-intes-
tinal effects (delayed diarrhoea requiring prompt treatment) may follow irinotecan treatment, anemia, alopecia, and anorexia.

The Scottish Medicines Consortium (p. 4) has advised (November 2007) that topotecan (Hycamtin®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

The Scottish Medicines Consortium (p. 4) has advised (March 2009) that use of topotecan capsules within NHS Scotland is restricted to patients in whom standard intravenous chemotherapy is inappropriate and who would otherwise receive best supportive care.

NICE guidance
Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009)
Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.

NICE guidance
Topotecan for the treatment of relapsed small-cell lung cancer (November 2009)
Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if re-treatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated. Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.

NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)
See p. 542

IRINOTECAN HYDROCHLORIDE

Indications see notes above
Cautions see section 8.1 and notes above; raised plasma-bilirubin concentration (see under Hepatic impairment); monitor respiratory function; interactions: Appendix 1 (irinotecan)
Contra-indications see section 8.1 and notes above; also chronic inflammatory bowel disease, bowel obstruction
Hepatic impairment monitor closely for neutropenia if plasma-bilirubin concentration 1.5–3 times upper limit of normal range (consult product literature); avoid if plasma-bilirubin concentration greater than 3 times upper limit of normal range
Renal impairment manufacturer advises avoid—no information available
Pregnancy avoid (teratogenicity and toxic in animal studies); manufacturer advises effective contraception during and for at least 3 months after treatment; see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding

8.1.5 Other antineoplastic drugs

Side-effects see section 8.1 and notes above; also acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature); less commonly interstitial pulmonary disease

Irinotecan (Non-proprietary) Infusion, irinotecan hydrochloride 20 mg/mL, net price 2-mL vial = £49.03, 5-mL vial = £120.25, 15-mL vial = £370.50, 25-mL vial = £601.25
Campto® (Pfizer) Infusion, irinotecan hydrochloride 20 mg/mL, net price 2-mL vial = £53.00; 5-mL vial = £130.00; 15-mL vial = £390.00

TOPOTECAN

Indications see notes above
Cautions see section 8.1 and notes above
Contra-indications see section 8.1 and notes above
Hepatic impairment avoid in severe impairment
Renal impairment reduce dose; avoid infusion if creatinine clearance less than 20 mL/minute; avoid oral route if creatinine clearance less than 60 mL/minute

Pregnancy avoid (teratogenicity and fetal loss in animal studies); see also Reproductive Function, p. 520
Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Hycamtin® (GSK)

Capsules, topotecan (as hydrochloride) 250 micrograms (white), net price 10-cap pack = £75.00; 1 mg (pink), 10-cap pack = £300.00. Label: 25

Intravenous infusion, powder for reconstitution, topotecan (as hydrochloride), net price 1-mg vial = £97.65; 4-mg vial = £290.62

Trabectedin

Trabectedin is licensed for the treatment of advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated and in combination with pegylated liposomal doxorubicin for the treatment of relapsed platinum-sensitive ovarian cancer.

Trabectedin is given by intravenous infusion. A corticosteroid, such as dexamethasone by intravenous infusion, should be given 30 minutes before therapy for its anti-emetic and hepatoprotective effects.

NICE guidance
Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010)
Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

NICE guidance
Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010)
Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

TRABECTEDIN

Indications see notes above
Cautions see section 8.1 and notes above; measure creatine phosphokinase, renal function and hepatic function before starting (consult product literature);
monitor haematological and hepatic parameters weekly during first 2 cycles and at least once between treatments in subsequent cycles; concomitant use with hepatotoxic drugs (avoid alcohol)

**Hepatic impairment** manufacturer advises caution in impairment—consider dose reduction; avoid in patients with raised bilirubin

**Renal impairment** avoid monotherapy if creatinine clearance less than 30 mL/minute; avoid combination regimens if creatinine clearance less than 60 mL/minute

**Pregnancy** effective contraception recommended during and for at least 3 months after treatment in women and at least 5 months after treatment in men; see also Reproductive Function, p. 520

**Breast-feeding** manufacturer advises avoid breast-feeding during and for 3 months after treatment

**Side-effects** see section 8.1; also abdominal pain, constipation, diarrhoea, dyspepsia, taste disturbance, hepatobiliary disorders; hypotension, oedema, flushing; dyspnoea, cough; headache, insomnia, peripheral neuropathy, paraesthesia, dizziness, anorexia, asthenia, fatigue; pyrexia; hypokalaemia, dehydration, increased blood creatine phosphokinase; myalgia, arthralgia, back pain

**Yondelis** (Pharma Mar) \(\updownarrow\) [NW]

*Injection*, powder for reconstitution, trabectedin, net price 250-microgram vial = £363.00; 1-mg vial = £1366.00

**Trastuzumab**

Trastuzumab is licensed for the treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2).

Trastuzumab is also licensed, in combination with paclitaxel or docetaxel, for metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate.

Trastuzumab is also licensed, in combination with an aromatase inhibitor, for metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab.

Trastuzumab is also licensed as monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapies regimens in which, appropriate, an anthracycline and a taxane; women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy.

Trastuzumab is also licensed, in combination with capecitabine or fluorouracil and cisplatin, for metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer.

Trastuzumab is given by intravenous infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist. See section 8.3.4.1 for the role of trastuzumab in the treatment of breast cancer.

**Use with anthracyclines** Concomitant use of trastuzumab with anthracyclines (section 8.1.2) is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If an anthracycline needs to be used, cardiac function should be monitored closely.

**NICE guidance**

**Trastuzumab for the treatment of HER2-positive metastatic gastric cancer** (November 2010)

Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:

- have not received treatment for metastatic disease and
- have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.

**Trastuzumab**

**Indications** see notes above and product literature

**Cautions** see section 8.1 and notes above; symptomatic heart failure, history of hypertension, coronary artery disease, uncontrolled arrhythmias

**Cardiotoxicity** Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature

**Contra-indications** see section 8.1 and notes above; severe dyspnoea at rest

**Pregnancy** avoid unless potential benefit outweighs risk; oligohydramnios and anhydramnios reported

**Breast-feeding** avoid breast-feeding during treatment and for six months afterwards

**Side-effects** see section 8.1; also infusion-related side-effects including chills, fever, hypersensitivity reactions such as anaphylaxis, urticaria, and angioedema; gastro-intestinal symptoms; cardiotoxicity (see also above), chest pain, hypotension; pulmonary events (possibly delayed onset); headache, taste disturbance, anxiety, malaise, depression, insomnia, drowsiness, dizziness, paraesthesia, tremor, asthenia, peripheral neuropathy, hypotonia; mastitis, urinary tract infection; ecchymosis, oedema, weight loss; arthralgia, myalgia, arthritis, bone pain, leg cramps; rash, pruritus, sweating, dry skin, alopecia, acne, nail disorders

**Herceptin** (Roche) \(\updownarrow\) [NW]

*Intravenous infusion*, powder for reconstitution, trastuzumab, net price 150-mg vial = £407.40

**Tretinoin**

**Indications** see notes above; acne (section 13.6.1); photodamage (section 13.8.1)

**Caution** exclude pregnancy before starting treatment; monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids

**Note** Tretinoin is the acid form of vitamin A
before and during treatment; increased risk of thromboembolism during first month of treatment; interactions: Appendix 1 (retinoids)

**Hepatic impairment** reduce dose to 25 mg/m²

**Renal impairment** reduce dose to 25 mg/m²

**Pregnancy** teratogenic; effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective)

**Breast-feeding** avoid

**Side-effects** retinoic acid syndrome (fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleukocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure) requires immediate treatment—consult product literature; gastro-intestinal disturbances, pancreatitis; arthralgia; flushing, oedema; headache; benign intracranial hypertension (mainly in children—consider dose reduction if intractable headache in children), shivering, dizziness, confusion, anxiety, depression, insomnia, paraesthesia, visual and hearing disturbances; raised liver enzymes, serum creatinine and lipids; bone and chest pain, alopecia, erythema, rash, pruritus, sweating, dry skin and mucous membranes, chelitis; thromboembolism, hypercalcaemia, and genitai ulceration reported

**Dose**

- **ADULT** and **CHILD** 45 mg/m² daily in 2 divided doses, max. duration of treatment 90 days (consult product literature for details of concomitant chemotherapy)

**Vesanoid** (Roche)

Capsules, yellow/brown, tretinoin 10 mg, net price 100-cap pack = £160.63. Label: 21, 25

---

### 8.2 Drugs affecting the immune response

#### 8.2.1 Antiproliferative immunosuppressants

**Azathioprine** is widely used for transplant recipients and is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol is given concurrently.

Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment with azathioprine. The enzyme thiopurine methyltransferase (TPMT) metabolises azathioprine; the risk of myelosuppression is increased in those with reduced activity of the enzyme, particularly in the few individuals who are deficient for TPMT activity. Consider measuring TPMT activity before starting azathioprine therapy. Patients with deficient TPMT activity should not receive azathioprine; those with reduced TPMT activity may be treated under specialist supervision.

**Mycophenolate mofetil** is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine. It is licensed for the prophylaxis of acute rejection in renal, hepatic or cardiac transplantation when used in combination with cyclosporin and corticosteroids. There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation of mycophenolate mofetil should be considered under specialist supervision.

**Cyclophosphamide** (section 8.1.1) is less commonly prescribed as an immunosuppressant.
AZATHIOPRINE

Indications see notes above; inflammatory bowel disease [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); severe refractory eczema [unlicensed indication] (section 13.5.3)

Cautions see notes above; monitor for toxicity throughout treatment; monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months; reduce dose in elderly; interactions: Appendix 1 (azathioprine)

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection

Contra-indications see notes above; hypersensitivity to mercaptopurine

Hepatic impairment reduce dose; monitor liver function; see also Cautions

Renal impairment reduce dose; see also Cautions

Pregnancy treatment should not generally be initiated during pregnancy; see also p. 553

Breast-feeding present in milk in low concentration; no evidence of harm in small studies—use if potential benefit outweighs risk

Side-effects hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis—calling for immediate withdrawal); dose-related bone marrow suppression (see also Cautions); liver impairment, cholestatic jaundice, hair loss and increased susceptibility to infections and colitis in patients also receiving corticosteroids; nausea, rarely pancreatitis, pneumonitis, hepatic veno-occlusive disease, lymphoma

Dose
● By mouth, or (if oral administration not possible—intravenous solution very irritant, see below) by intravenous injection over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion), or by intravenous infusion

Autoimmune conditions, 1–3 mg/kg daily, adjusted according to response (consider withdrawal if no improvement within 3 months)

Suppression of transplant rejection, 1–2.5 mg/kg daily according to response

Note Azathioprine doses in BNF may differ from those in product literature

Note Intravenous injection is alkaline and very irritant, intravenous route should therefore be used only if oral route not feasible, see also Appendix 6

Azathioprine (Non-proprietary) \(\text{\textregistered}\)

Tablets, azathioprine 25 mg, net price 28-tab pack = £8.67; 50 mg, 60-tab pack = £15.56. Label: 21

Brands include: Azamune \(\text{\textregistered}\)

IMURAN \(\text{\textregistered}\) (Aspen)

Tablets, both f/c, azathioprine 25 mg (orange), net price 100-tab pack = £10.99; 50 mg (yellow), 100-tab pack = £7.99. Label: 21

Injection, powder for reconstitution, azathioprine (as sodium salt), net price 50-mg vial = £15.38

MYCOPHENOLATE MOFETIL

Indications prophylaxis of acute renal, cardiac, or hepatic transplant rejection (in combination with ciclosporin and corticosteroids) under specialist supervision

Cautions full blood counts every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops); exclude pregnancy before starting treatment; elderly (increased risk of infection, gastrointestinal haemorrhage and pulmonary oedema); children (higher incidence of side-effects may call for temporary reduction of dose or interruption); active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation); delayed graft function; increased susceptibility to skin cancer (avoid exposure to strong sunlight); interactions: Appendix 1 (mycophenolate)

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding

Renal impairment no data available in cardiac or hepatic transplant patients with renal impairment

Pregnancy avoid—congenital malformations reported, effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment

Breast-feeding avoid—present in milk in animal studies

Side-effects taste disturbance, gingival hyperplasia, nausea, constipation, flatulence, anorexia, weight loss, vomiting, abdominal pain, gastro-intestinal inflammation, ulceration, and bleeding, hepatitis, jaundice, pancreatitis, stomatitis, oedema, tachycardia, hypertension, hypotension, vasodilatation, cough, dyspnoea, insomnia, agitation, confusion, depression, anxiety, convulsions, paraesthesia, myasthenic syndrome, tremor, dizziness, headache, influenza-like syndrome, infections, hyperglycaemia, renal impairment, malignancy (particularly of the skin), blood disorders (including leucopenia, anaemia, thrombocytopenia, pancytopenia, and red cell aplasia—see notes above), disturbances of electrolytes and blood lipids, arthralgia, alopecia, acne, skin hypertrophy, and rash; also reported intestinal villous atrophy, progressive multifocal leucoencephalopathy, intestinal lung disease, pulmonary fibrosis

Dose
● Renal transplantation, by mouth, 1 g twice daily starting within 72 hours of transplantation or by intravenous infusion, 1 g twice daily starting within 24 hours of transplantation for max. 14 days (then transfer to oral therapy); CHILD and ADOLESCENT 2–18 years, by mouth 600 mg/m² twice daily (max. 2 g daily)

Note Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m²

● Cardiac transplantation, by mouth, ADULT over 18 years, 1.5 g twice daily starting within 5 days of transplantation

● Hepatic transplantation, by intravenous infusion, ADULT over 18 years, 1 g twice daily starting within 24 hours of transplantation for 4 days (up to max. 14 days), then by mouth, 1.5 g twice daily as soon as is tolerated
8.2.2 Corticosteroids and other immunosuppressants

Prednisolone (section 6.3.2) is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin’s disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being (see also Prescribing in Palliative Care, p. 21).

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin is a calcineurin inhibitor, and a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

Basiliximab is a monoclonal antibody that prevents T-lymphocyte proliferation; it is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Antithymocyte immunoglobulin (rabbit) is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

### NICE guidance

**Immunosuppressive therapy for renal transplantation in adults (September 2004)**

Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006)

For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab (discontinued) are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children, see above] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.
Renal transplantation, by intravenous infusion over at least 6 hours, 1–1.5 mg/kg daily for 3–9 days

- Corticosteroid-resistant renal graft rejection, by intravenous infusion over at least 6 hours, 1.5 mg/kg daily for 7–14 days

Note To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

Thymoglobuline® (Genzyme) ▼ ▼

Intravenous infusion, powder for reconstitution, rabbit anti-human thymocyte immunoglobulin, net price 25-mg vial = £158.77

BASILIXIMAB

Indications see notes above

Pregnancy avoid—no information available; adequate contraception must be used during treatment and for 16 weeks after last dose

Breast-feeding avoid—no information available

Side-effects severe hypersensitivity reactions and cytokine release syndrome have been reported

Dose

- By intravenous injection or by intravenous infusion, 20 mg within 2 hours before transplant surgery and 20 mg 4 days after surgery; withhold second dose if severe hypersensitivity or graft loss occurs; CHILD and ADOLESCENT 1–17 years, body-weight under 35 kg, 10 mg within 2 hours before transplant surgery and 10 mg 4 days after surgery; body-weight over 35 kg, adult dose

Simulect® (Novartis) ▼

Injection, powder for reconstitution, basiliximab, net price 10-mg vial = £758.69, 20-mg vial = £842.38 (both with water for injections). For intravenous infusion

CICLOSPORIN (Cyclosporin)

Indications see notes above, and under Dose; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); atopic dermatitis and psoriasis (section 13.5.3)

Cautions monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients; monitor liver function (see Hepatic Impairment below); monitor blood pressure—discontinue if hypertension develops that cannot be controlled by anti-hypertensives; hyperuricaemia; monitor serum magnesium; measure blood lipids before treatment and thereafter as important changes in blood-ciclosporin concentration. Important changes on long-term administration, see also under Cautions), hyperuricaemia, hyperkalaemia, hyperlipidaemia, hypercholesterolaemia, muscle cramps, myalgia, hypertrichosis; less commonly oedema, weight gain, signs of encephalopathy, anaemia, thrombocytopenia; rarely pancreatitis, motor polyneuropathy, menstrual disturbances, gynaecomastia, microangiopathic haemolytic anaemia, haemolytic uraemic syndrome, hyperglycaemia, muscle weakness, myopathy, visual disturbances secondary to benign intracranial hypertension (discontinue); also reported with infusion anaphylaxis

Dose

- Organ transplantation, used alone, ADULT and CHILD over 3 months 10–15 mg/kg by mouth 4–12 hours before transplantation followed by 10–15 mg/kg daily for 1–2 weeks postoperatively then reduced gradually to 2–6 mg/kg daily for maintenance (dose should be adjusted according to blood-ciclosporin concentration and renal function); dose lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

- Bone-marrow transplantation, prevention and treatment of graft-versus-host disease, ADULT and CHILD over 3 months 3–5 mg/kg daily by intravenous infusion over 2–6 hours from day before transplantation to 2 weeks postoperatively (or 12.5–15 mg/kg daily by mouth) then 12.5 mg/kg daily by mouth for 3–6 months then tailed off (may take up to a year after transplantation)

- Nephrotic syndrome, by mouth, 5 mg/kg daily in 2 divided doses; CHILD 6 mg/kg daily in 2 divided doses; maintenance treatment reduce to lowest effective dose according to proteinuria and serum creatine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

Hepatic impairment dosage adjustment based on bilirubin and liver enzymes may be needed

Renal impairment dose as in normal renal function but see Cautions above; in nephrotic syndrome reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement; in patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily

Pregnancy crosses placenta; see Immunosuppressant Therapy, p. 553

Breast-feeding present in milk—manufacturer advises avoid

Side-effects anorexia, nausea, vomiting, abdominal pain, diarrhoea, gingival hyperplasia, hepatic dysfunction, hypertension, tremor, headache, paraesthesia, fatigue, renal dysfunction (renal structural changes on long-term administration, see also under Cautions), hyperuricaemia, hyperkalaemia, hyperlipidaemia, hypercholesterolaemia, muscle cramps, myalgia, hypertrichosis; less commonly oedema, weight gain, signs of encephalopathy, anaemia, thrombocytopenia; rarely pancreatitis, motor polyneuropathy, menstrual disturbances, gynaecomastia, microangiopathic haemolytic anaemia, haemolytic uraemic syndrome, hyperglycaemia, muscle weakness, myopathy, visual disturbances secondary to benign intracranial hypertension (discontinue); also reported with infusion anaphylaxis

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function.
SIROLIMUS

Indications  prophyllaxis of organ rejection in kidney allograft recipients (initially in combination with ciclosporin and corticosteroid, then with corticosteroid only); see also under Dose

Cautions  monitor kidney function when given with ciclosporin; monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses); hyperlipidaemia (monitor lipids); monitor urine proteins; increased susceptibility to infection (especially urinary tract infection); increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light); interactions: Appendix 1 (sirolimus)

Hepatic impairment  monitor whole blood-sirolimus level closely and consult local treatment protocol; clearance reduced in mild to moderate impairment; in severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration

Pregnancy  avoid unless essential—(toxicity in animal studies); effective contraception must be used during treatment and for 12 weeks after stopping

Breast-feeding  discontinue breast-feeding

Side-effects  abdominal pain, constipation, nausea, diarrhoea, ascites, stomatitis; oedema, tachycardia, hypertension, hypercholesterolaemia, hypertriglyceridaemia, venous thromboembolism; pleural effusion, pneumonitis; headache; pyrexia; proteinuria, haemolytic uraemic syndrome; anaemia, thrombocytopenia, thrombotic thrombocytopenic purpura, leucopenia, neutropenia, hypokalaemia, hypophosphataemia, hyperglycaemia, lymphocele; arthralgia, osteonecrosis; epistaxis; acne, rash, impaired healing; less commonly pancreatitis, pulmonary embolism, pulmonary haemorrhage, pericardial effusion, nephrotic syndrome, pancytopenia; rarely interstitial lung disease, alveolar proteinosis, hepatic necrosis, lymphoedema, and hypersensitivity reactions including anaphylactic reactions, angioedema, exfoliative dermatitis, and hypersensitivity vasculitis; focal segmental glomerulosclerosis and reversible impairment of male fertility also reported

Dose

- Initially 6 mg, after surgery (once wound has healed), then 2 mg once daily (dose adjusted according to whole blood-sirolimus trough concentration) in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus given 4 hours after ciclosporin); ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used)

Note  Manufacturer advises pre-dose (‘trough’) whole blood-sirolimus concentration (using chromatographic assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ), after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ), close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped, see also Hepatic Impairment above

When changing between oral solution and tablets, measurement of whole blood ‘trough’ sirolimus concentration after 1–2 weeks is recommended

Therapeutic drug monitoring assays  Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range

Rapamune® (Wyeth) Tablets, coated, sirolimus 0.5 mg (tan), net price 30-tab pack = £69.00; 1 mg (white), 30-tab pack = £86.49; 2 mg (yellow), 30-tab pack = £172.98. Counselling, administration

Important  The 0.5-mg tablet is not bioequivalent to the 1-mg, 2-mg, and 5-mg tablets. Multiples of 0.5-mg tablets should not be used as a substitute for other tablet strengths

Oral solution, sirolimus 1 mg/mL, net price 60 mL = £162.41. Counselling, administration

Counselling  Food may affect absorption (take at the same time with respect to food). Mix solution with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids

BNF 61

8.2.2 Corticosteroids and other immunosuppressants
**TACROLIMUS**

**Indications** prophylaxis of organ rejection in liver, kidney, and heart allograft recipients and allograft rejection resistant to conventional immunosuppressive regimens; see also notes above; moderate to severe atopic eczema (section 13.5.3)

**Cautions** monitor blood pressure, ECG (important: see Cardiomyopathy below), fasting blood-glucose concentration, haematological and neurological (including visual) parameters, electrolytes, hepatic and renal function; monitor whole blood-tacrolimus trough concentration especially during episodes of diarrhoea—consult local treatment protocol for details; QT-interval prolongation; neurotoxicity; increased risk of infections, malignancies, and lymphoproliferative disorders; avoid excessive exposure to UV light including sunlight; pregnancy (exclude before starting); interactions: Appendix 1 (tacrolimus);

**Driving** May affect performance of skilled tasks (e.g. driving)

**Contra-indications** hypersensitivity to macrolides; avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin); hepatic impairment dose reduction may be necessary in severe impairment

**Pregnancy** avoid unless potential benefit outweighs risk—risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia; toxicity in animal studies

**Breast-feeding** avoid—present in milk

**Side-effects** nausea, vomiting, diarrhoea, constipa-
tion, dyspepsia, flatulence, bloating, weight changes, anorexia, gastrointestinal inflammation, ulceration, and perforation, hepatic dysfunction, jaundice, cholestasis, ascites, bile-duct abnormalities, oedema, tachycardia, hypertension, haemorrhage, thromboembolic and ischaemic events, dyspnoea, pleural effusion, parenchymal lung disorders, sleep disturb-
tances, tremor, headache, peripheral neuropathy, mood changes, depression, confusion, anxiety, para-
chois, seizures, paraesthesia, dizziness, renal impair-
ment, renal failure, renal tubular necrosis, urinary abnormalities, hyperglycaemia, electrolyte distur-
bances (including hyperkalaemia, hypokalaemia, and hyperuricaemia), blood disorders (including anaemia, leucopenia, pancytopenia, and thrombocytopenia), arthralgia, muscle cramp, visual disturbances, photopho-
bia, tinnitus, impaired hearing, alopecia, sweating, acne; less commonly paralytic ileus, gastro-intestinal reflux disease, peritonitis, pancreatitis, heart failure, arrhythmia, cardiac arrest, cerebrovascular accident, cardiomyopathy (important: see Cardiomyopathy below), palpitation, respiratory failure, coma, speech disorder, amnesia, paralysis, influenza-like symptoms, encephalopathy, coagulation disorders, photosensitiv-
ity, cataract, hypoglycaemia, dysmenorrhoea, hypertonia, dermatitis; rarely pericardial effusion, respiratory distress syndrome, posterior reversible encephalopathy syndrome, dehydration, thrombotic thrombocytopenic purpura, blindness, toxic epider-
mal necrolysis, hirsutism; very rarely myasthenia, haemorrhagic cystitis, Stevens-Johnson syndrome

**Cardiomyopathy** Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur

**Dose**

- See under preparations

### Important

**Adopta**®, **Prograf**®, **Modigraf**®, and **Advagraf** (tacrolimus): serious medication errors

- It is important to note the correct use of these medicines:
  - **Adopta**® is an immediate-release formulation that is taken twice daily, once in the morning and once in the evening;
  - **Prograf**® is an immediate-release formulation that is taken twice daily, once in the morning and once in the evening;
  - **Modigraf** granules are used to prepare an immediate-release suspension which is taken twice daily, once in the morning and once in the evening;
  - **Advagraf** is a prolonged-release formulation that is taken once daily in the morning.

Switching between **Adopta**®, **Prograf**®, **Modigraf**®, and **Advagraf** requires careful therapeutic monitoring. Substitution should be made only under the close supervision of a transplant specialist.

#### Adopta® (Sandoz) ▼

- **Capsules**, tacrolimus (as monohydrate) 500 micro-

- Orams (white/yellow), net price 50-cap pack = £50.50; 1 mg (white/brown), 50-cap pack = £65.52, 100-cap pack = £131.02; 5 mg (white/orange), 50-cap pack = £242.05. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

Dose

- Liver transplantation, starting 12 hours after transplanta-

- Tion, by mouth, 100–200 micrograms/kg daily in 2 divided doses, **CHILD** 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 300–400 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction, starting within 5 days of transplantation, by mouth, 75 micrograms/kg daily in 2 divided doses, **CHILD** without antibody induction, 300 micro-

- Orams/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion); following antibody induction, 100–300 micrograms/kg daily in 2 divided doses

Maintenance treatment, dose adjusted according to response

Rejection therapy, seek specialist advice

- **Capsules**, tacrolimus (as monohydrate) 500 micro-

- Orams (yellow), net price 50-cap pack = £61.88; 1 mg (white), 50-cap pack = £80.28, 100-cap pack = £160.54; 5 mg (greyish-red), 50-cap pack = £296.58. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC
Rituximab should be used with caution in patients receiving cardiotoxic chemotherapy or with a history of cardiovascular disease because exacerbation of angina, arrhythmia, and heart failure have been reported. Transient hypotension occurs frequently during infusion and antihypertensives may need to be withheld for 12 hours before infusion. Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

Infusion-related side-effects (including cytokine release syndrome) are reported commonly with anti-lymphotoxin monoclonal antibodies and occur predominantly during the first infusion; they include fever and chills, nausea and vomiting, allergic reactions (such as rash, pruritus, angioedema, bronchospasm and dyspnoea), flushing and tumour pain. Patients should be given paracetamol and an antihistamine before each dose of anti-lymphotoxin monoclonal antibodies to reduce these effects. Premedication with a corticosteroid should also be considered. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphotoxin monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

8.2.3 Anti-lymphotoxin monoclonal antibodies

Rituximab causes lysis of B lymphocytes. It is licensed for the treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin’s lymphoma and, in combination with other chemotherapy, for previously untreated stage III–IV follicular lymphoma, and for previously untreated or relapsed chronic lymphocytic leukaemia (see NICE guidance below). Rituximab is also licensed for maintenance therapy in patients with relapsed or refractory follicular non-Hodgkin’s lymphoma (see NICE guidance below). It is also licensed for use in combination with other chemotherapy for the treatment of diffuse large B-cell non-Hodgkin’s lymphoma (see NICE guidance below). Full resuscitation facilities should be at hand and as with other cytotoxics, treatment should be undertaken under the close supervision of a specialist. See section 10.1.3 for the role of rituximab in rheumatoid arthritis.

BNF 61

8.2.3 Anti-lymphotoxin monoclonal antibodies

Concentrate for intravenous infusion, tacrolimus

5 mg/mL. To be diluted before use. Net price 1-mL amp = £58.46

Note: Tacrolimus is incompatible with PVC

Dose: intravenous infusion over 24 hours, 30–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy); CHILD by mouth, 300 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy); CHILD by mouth, 300 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 75–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Heart transplantation with antibody induction, starting within 5 days of transplantation, by mouth, 75 micrograms/kg daily in 2 divided doses or by intravenous infusion over 24 hours, 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy); CHILD, without antibody induction, initially by intravenous infusion over 24 hours, 30–50 micrograms/kg daily; then by mouth, 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion); following antibody induction, by mouth, 100–300 micrograms/kg daily in 2 divided doses

Maintenance treatment, dose adjusted according to response

Rejection therapy: seek specialist advice

8.2.3 Anti-lymphotoxin monoclonal antibodies

Rituximab causes lysis of B lymphocytes. It is licensed for the treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin’s lymphoma and, in combination with other chemotherapy, for previously untreated stage III–IV follicular lymphoma, and for previously untreated or relapsed chronic lymphocytic leukaemia (see NICE guidance below). Rituximab is also licensed for maintenance therapy in patients with relapsed or refractory follicular non-Hodgkin’s lymphoma (see NICE guidance below). It is also licensed for use in combination with other chemotherapy for the treatment of diffuse large B-cell non-Hodgkin’s lymphoma (see NICE guidance below). Full resuscitation facilities should be at hand and as with other cytotoxics, treatment should be undertaken under the close supervision of a specialist. See section 10.1.3 for the role of rituximab in rheumatoid arthritis.
8 Malignant disease and immunosuppression

**NICE guidance**

Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009)

Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.

Rituximab for aggressive non-Hodgkin’s lymphoma (September 2003)

Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV. The use of rituximab for localised (stage I) disease should be limited to clinical trials.

Ofatumumab causes lysis of B and C lymphocytes and is licensed for use in patients with chronic lymphocytic leukaemia for whom fludarabine treatment is not appropriate. In common with rituximab, it causes infusion-related side-effects including cytokine release syndrome (see above); premedication with an analgesic, an anti-histamine, and a corticosteroid is recommended.

Alemtuzumab causes lysis of B and C lymphocytes and is licensed for use in patients with chronic lymphocytic leukaemia for whom fludarabine treatment is not appropriate. In common with rituximab, it causes infusion-related side-effects including cytokine release syndrome (see above); premedication with an analgesic, an anti-histamine, and a corticosteroid is recommended.

The Scottish Medicines Consortium (p. 4) has advised (August 2008) that alemtuzumab is accepted for restricted use within NHS Scotland for the treatment of B-cell chronic lymphocytic leukaemia (B-CLL) when fludarabine combination chemotherapy is not appropriate. Alemtuzumab is restricted to use in patients with previously untreated B-CLL, with the cytogenetic abnormality 17p-deletion.

Ofatumumab causes lysis of B lymphocytes. It is licensed for treatment of chronic lymphocytic leukaemia in patients refractory to fludarabine and alemtuzumab. Infusion-related side-effects (including cytokine release syndrome—see above) have been reported with ofatumumab; premedication with an analgesic, an anti-histamine, and a corticosteroid is recommended.

**ALEMTUZUMAB**

**Indications** see notes above

**Cautions** see notes above—for full details consult product literature

**Contra-indications** for full details consult product literature

**Pregnancy** avoid unless potential benefit outweighs risk; use effective contraception during and for 12 months after treatment

**Breast-feeding** discontinue breast-feeding during and for 12 months after treatment—no information available

**Side-effects** see notes above—for full details (including monitoring and management of side-effects) consult product literature

MabThera® (Roche) Concentrate for intravenous infusion, rituximab 100 mg/5 mL, net price £182.00

**RITUXIMAB**

**Indications** see notes above; severe active rheumatoid arthritis (section 10.1.3)

**Cautions** see notes above—for full details consult product literature

**Pregnancy** avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus—effective contraception required during and for 12 months after treatment

**Breast-feeding** avoid breast-feeding during and for 12 months after treatment

**Side-effects** see notes above—but for full details (including monitoring and management of side-effects) consult product literature

MabThera® (Roche) Concentrate for intravenous infusion, rituximab 100 mg/5 mL, net price £182.00

**Interferon alfa**

Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours. Interferon alfa preparations are also used in the treatment of chronic hepatitis B, and chronic hepatitis C ideally in combination with ribavirin (section 5.3.3). Side-effects are dose-related, but commonly include anorexia, nausea, diarrhoea, influenza-like symptoms, and lethargy. Ocular side-effects and depression (including suicidal behaviour) have also been reported. Myelosuppression may occur, particularly affecting granulocyte counts. Cardiovascular problems (hypotension, hypertension, palpitation, and arrhythmias), nephrotoxicity and hepatotoxicity have been reported. Hypertriglyceridaemia, sometimes severe, has been observed; monitoring of lipid concentration is recommended. Other side-effects include hypersensitivity reactions, thyroid abnormalities, hyperglycaemia, alopecia, psoriasisiform rash,

fusión, coma y convulsiones (usualmente con altas dosis en el adulto).

Polietileno de glicol-conjugado (‘pegilado’) derivados de interferón alfa (peginterferon alfa-2a y peginterferon alfa-2b) están disponibles; pegilación aumenta la persistencia del interferón en la sangre. Los peginterferones están indicados para el tratamiento de hepatitis crónica C, idealmente en combinación con ribavirina (véase sección 5.3.3). Peginterferon alfa-2a también está indicado para el tratamiento de hepatitis crónica B.

**Dosis**

Véase notas anteriores y consulte el producto.

**Efectos secundarios**

Es poco probable que sean perjudiciales; se deben evitar a menos que el beneficio potencial supere el riesgo (toxicidad en animales).

**Renal insuficiencia**

**Hepatopatía**

Close monitoring in mild to moderate impairment; avoid if severe.

**Contraindicaciones**

Consulte el producto literatura; evite si tiene severa.

**Cautelar**

Consulte el producto literatura; véase apartado preparaciones.

**Indicaciones**

Tratamiento de hepatitis crónica B. 5.3.3). Peginterferon alfa-2a también está licenciado para el tratamiento de hepatitis crónica B.

**Introducción**

**Preparaciones**

**Interferon beta**

**Interferon beta** está licenciado para uso en pacientes con múltiple esclerosis remitiendo/recaída (caracterizado por al menos dos episodios de desenfocamiento neurológico persistente en el período previo 2 o 3 años, seguido de un proceso completo o incompleto de recuperación) que son capaces de caminar. No todos los pacientes responden a la mejora en la longitud de los brotes que se ha observado en el pasado. También se ha utilizado para pacientes con secundario progresivo múltiple esclerosis, pero su rol en este condición no ha sido establecido.

**Cautelar**

Se advierte a aquellos con enfermedad hepática o renal, o que han padecido en el pasado enfermedad cardíaca, trastornos depresivos (evitar a menos que se presente una depresión intensa).
**Malignant disease and immunosuppression**

reported rarely with interferon beta-1b. alopecia, hepatitis, and thyroid dysfunction have been changes, suicide attempts, confusion and convulsions; disorders, menstrual disorders, mood and personality reactions (including anaphylaxis and urticaria), blood decrease over time; nausea and vomiting occur occasionally. Other side-effects include hypersensitivity reactions (including anaphylaxis and urticaria), blood disorders, menstrual disorders, mood and personality changes, suicide attempts, confusion and convulsions; alopecia, hepatitis, and thyroid dysfunction have been reported rarely with interferon beta-1b.

**Contra-indications** Avoid treatment with interferon beta in patients with severe depressive illness or those with decompensated liver disease.

**Side-effects** Side-effects reported most frequently include irritation at injection site (including inflammation, hypersensitivity, necrosis) and influenza-like symptoms (fever, chills, myalgia, or malaise) but these decrease over time; nausea and vomiting occur occasionally. Other side-effects include hypersensitivity reactions (including anaphylaxis and urticaria), blood disorders, menstrual disorders, mood and personality changes, suicide attempts, confusion and convulsions; alopecia, hepatitis, and thyroid dysfunction have been reported rarely with interferon beta-1b.

Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

**Provision of disease-modifying therapies for multiple sclerosis**

The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk)

**INTERFERON BETA**

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Injection** for relapsing, remitting multiple sclerosis, consult product literature

**Interferon beta-1b**

*Betaferon*® (Bayer Schering) 

Injection, powder for reconstitution, interferon beta-1b, net price 300-microgram (9.6 million-unit) vial with diluent = £39.78

*Note* For subcutaneous injection

**Injection** An autoinjector device (Betaject® Light) is available from Bayer Schering

**Dose** for relapsing, remitting multiple sclerosis, for secondary progressive multiple sclerosis with active disease, or for a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

**Extavia®** (Novartis) 

Injection, powder for reconstitution, interferon beta-1b. Net price 300-microgram (9.6 million-unit) vial with diluent = £39.78

*Note* for subcutaneous injection

**Dose** for relapsing, remitting multiple sclerosis, for secondary progressive multiple sclerosis with active disease, or for a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature
Interferon gamma

Interferon gamma-1b is licensed to reduce the frequency of serious infection in chronic granulomatous disease and in severe malignant osteopetrosis.

INTERFERON GAMMA-1b (immune interferon)

Indications see notes above

Cautions seizure disorders (including seizures associated with fever); cardiac disease (including ischaemia, congestive heart failure, and arrhythmias); monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count); blood chemistry tests (including renal and liver function tests) and urinalysis; avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response); interactions: Appendix 1 (interferons)

Driving May impair ability to drive or operate machinery; effects may be enhanced by alcohol

Hepatic impairment manufacturer advises caution in severe impairment—risk of accumulation

Renal impairment manufacturer advises caution in severe impairment—risk of accumulation

Pregnancy manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment—consult product literature

Breast-feeding patients advised to discontinue breast-feeding

Dose

• See under preparation

Immukin® (Boehringer Ingelheim) Injection, recombinant human interferon gamma-1b 200 micrograms/mL, net price 0.5-ml vial = £66.67

Dose By subcutaneous injection, 50 micrograms/m² 3 times a week; patients with body surface area of 0.5 m² or less, 1.5 micrograms/kg 3 times a week; not yet recommended for children under 6 months with chronic granulomatous disease

Aldesleukin

Aldesleukin (recombinant interleukin-2) is licensed for metastatic renal cell carcinoma excluding patients in whom all three of the following prognostic factors are present: performance status of Eastern Cooperative Oncology Group of 1 or greater, more than one organ present: performance status of Eastern Co-operative Oncology Group of 1 or greater, more than one organ present; and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment. It is usually given by subcutaneous injection. It is now rarely given by intravenous infusion because of an increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension. Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival. Bone-marrow, hepatic, renal, thyroid, and CNS toxicity is common. It is for use in specialist units only.

ALDESLEUKIN

Indications see notes above

Cautions consult product literature; interactions: Appendix 1 (aldesleukin)

Contra-indications consult product literature

Pregnancy use only if potential benefit outweighs risk (toxicity in animal studies); ensure effective contraception during treatment in men and women; see also Reproductive Function, p. 520

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1, notes above, and consult product literature

Dose

• Consult product literature

Proleukin® (Novartis) Injection, powder for reconstitution, aldesleukin. Net price 18-milligram unit vial = £112.00. For subcutaneous injection or intravenous infusion (but see notes above)

BCG bladder instillation

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from Mycobacterium bovis. It is licensed as a bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection.

BACILLUS CALMETTE-GUÉRIN

Indications see notes above; BCG immunisation (section 14.4)

Cautions screen for active tuberculosis (contra-indicated if tuberculosis confirmed); traumatic catheterisation or urethral or bladder injury (delay administration until mucosal damage healed)

Contra-indications impaired immune response. HIV infection, urinary-tract infection, severe haematuria, tuberculosis, fever of unknown origin

Pregnancy avoid

Breast-feeding avoid

Side-effects cystitis, dysuria, urinary frequency, haematuria, malaise, fever, influenza-like syndrome; also systemic BCG infection (with fatalities)—consult product literature

Dose

• Consult product literature

ImmuCyst® (Alliance) Bladder instillation, freeze-dried powder containing attenuated Mycobacterium bovis prepared from the Connaught strain of bacillus of Calmette and Guérin, net price 81-milligram vial = £79.23

OncoTICE® (Organon) Bladder instillation, freeze-dried powder containing attenuated Mycobacterium bovis prepared from the TICE strain of bacillus of Calmette and Guérin, net price 12.5-milligram vial = £71.61

8.2.4 Other immunomodulating drugs 563

Malignant disease and immunosuppression
Canakinumab

Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndrome, including severe forms of familial cold auto-inflamatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological, cutaneous, articular syndrome), which are rare inherited auto-inflammatory disorders.

Glatteramer acetate

Glatteramer acetate is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndrome, including severe forms of familial cold auto-inflamatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological, cutaneous, articular syndrome), which are rare inherited auto-inflammatory disorders.

HISTAMINE DIHYDROCHLORIDE

Histamine

Histamine is licensed for maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission.

GLATIRAMER ACETATE

Provision of disease-modifying therapies for multiple sclerosis

See p. 562

NICE guidance (interferon beta and glatiramer for multiple sclerosis)

See p. 562

Indications see notes above

Cautions cardiac disorders

Renal impairment no information available—manufacturer advises caution

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises caution—no information available

Side-effects hypersensitivity reactions; flushing, chest pain, palpitation, tachycardia, and dyspnoea may occur within minutes of injection; nausea, constipation, dyspepsia; syncope, anxiety, asthenia, depression, headache, tremor, sweating; oedema, lymphadenopathy; hypotension, back pain, arthralgia, influenza-like symptoms; injection-site reactions, rash; rarely seizures

Dose

• By subcutaneous injection, ADULT over 18 years, 20 mg daily

Copaxone® (Teva)

Injection, glatiramer acetate 20 mg/mL, net price 1-mL prefilled syringe = £18.73

Histamine

Histamine is licensed for maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission.

HISTAMINE DIHYDROCHLORIDE

Indications see notes above

Cautions consult product literature; interactions:

Appendix 1 (histamine)

Contra-indications consult product literature

Hepatic impairment increased risk of tachycardia and hypotension in moderate to severe impairment

Renal impairment increased risk of hypotension in severe impairment

Pregnancy manufacturer advises avoid—no information available; ensure effective contraception during treatment in men and women

Breast-feeding manufacturer advises avoid—no information available

Side-effects consult product literature

Cepelone® (Meda)

Injection, histamine dihydrochloride 1 mg/mL, net price 0.5-mL vial = £84.38

Canakinumab

Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndrome, including severe forms of familial cold auto-inflamatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological, cutaneous, articular syndrome), which are rare inherited auto-inflammatory disorders.

Glatteramer acetate

Glatteramer acetate is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndrome, including severe forms of familial cold auto-inflamatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological, cutaneous, articular syndrome), which are rare inherited auto-inflammatory disorders.
Lenalidomide and thalidomide

Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties. It is licensed, in combination with dexamethasone, for the treatment of multiple myeloma in patients who have received at least one previous therapy. The most serious side-effects of lenalidomide are venous thromboembolism and severe neutropenia. Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

The Scottish Medicines Consortium (p. 4) has advised (April 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies.

NICE guidance

Lenalidomide for the treatment of multiple myeloma (June 2009)

Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles.

Thalidomide is used in combination with melphalan and prednisolone as first-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors). It has immunomodulatory and anti-inflammatory activity. Thalidomide can cause drowsiness, constipation, and on prolonged use peripheral neuropathy.

Pregnancy

For women of child-bearing potential, pregnancy must be excluded before starting treatment (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment (oral combined hormonal contraceptives and copper-releasing intrauterine devices not recommended) and men should use condoms during treatment and for at least 1 week after stopping if their partner is pregnant or is of child-bearing potential and not using effective contraception. Women must comply with a pregnancy prevention programme.

Lenalidomide

Indications see notes above

Cautions see notes above; monitor full blood count (including differential white cell count and platelet count) before treatment and every week for the first 8 weeks then every 4 weeks (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develops—consult product literature); concomitant drugs that increase the risk of thromboembolism; high tumour burden—risk of tumour lysis syndrome, see p. 520; monitor thyroid function; risk factors for myocardial infarction; interactions: Appendix 1 (lenalidomide)

Thromboembolism Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb

Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Renal impairment starting dose 10 mg once daily if creatinine clearance 30–50 mL/minute; starting dose 15 mg on alternate days if creatinine clearance less than 30 mL/minute

Pregnancy important: teratogenic risk; see also notes above

Breast-feeding discontinue breast-feeding—no information available

Side-effects myocardial infarction, hypotension, deep vein thrombosis; pneumonia, dyspnoea; tremor; hypoaesthesia, fatigue, asthenia; neutropenia, thrombocytopenia, anaemia, lymphopenia, leucopenia; muscle cramp; pruritus, rash; rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; interstitial pneumonitis and pancreatitis also reported

Dose

- ADULT over 18 years, 25 mg once daily for 21 consecutive days of a 28-day cycle; for doses of dexamethasone, consult product literature

Revlimid® (Celgene) ▼ (TA)

Capsules, lenalidomide, 5 mg (white), net price 21-cap pack = £3570.00; 10 mg (blue/yellow), 21-cap pack = £3780.00; 15 mg (blue/white), 21-cap pack = £3969.00; 25 mg (white), 21-cap pack = £4368.00.

Label: 25, counselling, symptoms of thromboembolism, neutropenia, or thrombocytopenia, patient information leaflet

Note Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form, which must be sent to Celgene.

Thalidomide

Indications see notes above

Cautions see notes above; high tumour burden—risk of tumour lysis syndrome, see p. 520; concomitant use of drugs which increase risk of peripheral neuropathy or thromboembolism

Thromboembolism Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors. Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb

Peripheral neuropathy Monitor patients for signs and symptoms of peripheral neuropathy; patients and their carers should be advised to seek medical advice if symptoms such as paraesthesia, abnormal coordination, or weakness develop. Dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature. Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk

Hepatic impairment caution in severe impairment—no information available

Renal impairment caution in severe impairment—no information available

Pregnancy important teratogenic risk; see also notes above

Breast-feeding avoid—present in milk in animal studies

Side-effects vomiting, dry mouth, dyspepsia, constipation; bradycardia, cardiac failure, deep vein
thrombosis; dyspnoea, interstitial lung disease, pulmonary embolism, peripheral oedema; asthenia, confusion, depression, dizziness, drowsiness, peripheral neuropathy, dysaesthesia, paraesthesia, syncope, tremor; pyrexia, pneumonia, anaemia, leucopenia, neutropenia, lymphopenia, thrombocytopenia; skin reactions including Stevens-Johnson syndrome; also reported toxic epidermal necrolysis, intestinal obstruction, gastrointestinal perforation, hypothyroidism, and sexual dysfunction.

**Dose**
- **ADULT** over 18 years, 200 mg once daily at bedtime for 6-week cycle; max. 12 cycles

**Capsules**
- Mifamurtide, thalidomide 50 mg, net price 28-cap pack = £298.48. Label: 2, counselling, symptoms of peripheral neuropathy and thromboembolism (see above)

**Note**
- Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

**Mifamurtide**

**Indications** see notes above

**Cautions**
- asthma and chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy; history of autoimmune, inflammatory, or collagen disease; monitor renal function, hepatic function and clotting parameters; monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature; interactions: Appendix 1 (mifamurtide)

**Hepatic impairment** use with caution—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** avoid; effective contraception required

**Breast-feeding** avoid—no information available

**Side-effects**
- gastro-intestinal disturbances (including anorexia, nausea, vomiting, diarrhoea, constipation, abdominal pain, dyspepsia); tachycardia, hypertension, palpitations, hypotension, phlebitis, flushing; oedema, respiratory disorders (including dyspnoea, epistaxis, cough, tachypnoea, haemoptysis, pleural effusion); confusion, depression, insomnia, headache, dizziness, paraesthesia, hypoesthesia, tremor, drowsiness, anxiety; hypokalaemia, anaemia, leucopenia, thrombocytopenia, granulocytopenia; haematuria, dysuria, pollakiuria; musculoskeletal pain; blurred vision; vertigo, tinnitus, hearing loss; sweating, alopecia, rash, dry skin

**Mepact®** (Takeda)▼

**Infusion** intravenous infusion, powder for reconstitution, mifamurtide encapsulated in liposomes, net price 4-mg vial = £2375.00

**Natalizumab**

**Natalizumab**

**Indications**
- rems in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

**NICE guidance**

Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)

Natalizumab is a monoclonal antibody that inhibits the migration of leukocytes into the central nervous system, hence reducing inflammation and demyelination. It is licensed for use in patients with highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or those with rapidly evolving severe relapsing-remitting multiple sclerosis. Treatment with natalizumab should be initiated and supervised by a specialist.

Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leukoencephalopathy (PML). The risk of developing PML increases after 2 years of therapy; the risk beyond 3 years treatment is not known. A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab, and annually thereafter. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Infusion-related side-effects include nausea, vomiting, flushing, headache, dizziness, fatigue, rigors, pyrexia, arthralgia, urticaria, and pruritus. Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion. Natalizumab should be discontinued permanently if hypersensitivity reaction occurs.

The Scottish Medicines Consortium (p. 4) has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

**Liver toxicity** Liver dysfunction reported; advise patients to monitor liver function (see below)

**Progressive multifocal leukoencephalopathy (PML)** Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years,
they should be given an alert card which includes information about the symptoms of PML (see also notes above). Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation)

**Contra-indications** progressive multifocal leucoencephalopathy; active infection (see notes above); concurrent use of interferon beta or glatiramer acetate; immunosuppression; active malignancies (except cutaneous basal cell carcinoma)

**Pregnancy** avoid unless essential—toxicity in animal studies

**Breast-feeding** present in milk—no adverse effects

**Side-effects** see notes above; also urinary-tract infection, nasopharyngitis, autoantibodies, and arthralgia; less commonly hypersensitivity reactions (see above); liver toxicity also reported

**Dose**
- By intravenous infusion, ADULT over 18 years, 300 mg once every 4 weeks; discontinue if no response after 6 months

**Tysabri** (Biogen) Concentrate for intravenous infusion
- **Adults** 20 mg/mL, net price 15-mL vial = £1130.00. Counselling, liver toxicity, progressive multifocal leucoencephalopathy, and hypersensitivity, patient alert card

---

**8.3 Sex hormones and hormone antagonists in malignant disease**

**8.3.1 Oestrogens**

**Diethylstilbestrol** (Stilboestrol) is sometimes used to treat prostate cancer, but it is not usually used first-line because of its side-effects. It is occasionally used in postmenopausal women with breast cancer. Toxicity is common and dose-related side-effects include nausea, fluid retention, and venous and arterial thrombosis. Impotence and gynaecomastia always occur in men, and withdrawal bleeding may be a problem in women. Hypercalcaemia and bone pain may also occur in breast cancer.

**Ethinylestradiol** is the most potent oestrogen available; unlike other oestrogens it is only slowly metabolised in the liver. Ethinylestradiol is licensed for the palliative treatment of prostate cancer.

**Hypersensitivity reactions** Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation)

**Contra-indications** progressive multifocal leucoencephalopathy; active infection (see notes above); concurrent use of interferon beta or glatiramer acetate; immunosuppression; active malignancies (except cutaneous basal cell carcinoma)

**Pregnancy** avoid unless essential—toxicity in animal studies

**Breast-feeding** present in milk—no adverse effects

**Side-effects** see notes above; also urinary-tract infection, nasopharyngitis, autoantibodies, and arthralgia; less commonly hypersensitivity reactions (see above); liver toxicity also reported

**Dose**
- Breast cancer, 10–20 mg daily
- Prostate cancer, 1–3 mg daily

**Diethylstilbestrol** (Non-proprietary)
- **Tablets**, diethylstilbestrol 1 mg, net price 28 = £53.34; 5 mg, 28 = £180.05

**8.3.2 Progestogens**

Progestogens have a role in the treatment of endometrial cancer; their use in breast cancer and renal cell cancer has declined. Progestogens are now rarely used to treat prostate cancer. **Medroxyprogesterone** or **megestrol** are usually chosen and can be given orally; high-dose or parenteral treatment cannot be recommended. Side-effects are mild but may include nausea, fluid retention, and weight gain.

---

**8.3.3 Androgens**

**Androsta-1,4-diene-3,17-dione** is also available for use in hormone replacement therapy and for the treatment of palliative conditions. Side-effects reported are similar to those of testosterone (see section 6.4.1.4).

**Androgens**

**Androsta-1,4-diene-3,17-dione** is also available for use in hormone replacement therapy and for the treatment of palliative conditions. Side-effects reported are similar to those of testosterone (see section 6.4.1.4).

**Cautions** see section 6.4.1.1; interactions: Appendix 1 (oestrogens)

**Contra-indications** see section 6.4.1.1

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives (section 7.3.1)

**Side-effects** see section 6.4.1.1

**Dose**
- Prostate cancer (palliative), 0.15–1.5 mg daily

---

**8.3.4 Hormone antagonists**

**Bisphenol A** is a commonly used industrial chemical. It is not metabolised in the body but is excreted in the urine. It has a weak oestrogenic effect and is thought to be carcinogenic.

**Other hormone antagonists** include **Tamoxifen**, **Fulvestrant**, and **Megestrol acetate**. These treatments are not curative, but may provide excellent palliation of symptoms in selected patients, sometimes for a period of years. Tumour response, and treatment toxicity should be carefully monitored and treatment changed if progression occurs or side-effects exceed benefit.
Malignant disease and immunosuppression

Dose
- See preparations below

Provera® (Pharmacia) Tablets
Medroxyprogesterone acetate 100 mg (scored), net price 60-tab pack = £29.98, 100-tab pack = £49.94; 200 mg (scored), 30-tab pack = £58.67
- Dose endometrial and renal cell cancer, 200–400 mg daily
- Breast cancer, 400–800 mg daily

MEGESTROL ACETATE
Indications
- Breast cancer, 160 mg once daily

NORETHISTERONE
Indications
- Breast cancer, 40 mg daily, increased to 60 mg daily if required

Preparations
- Section 6.4.1.2

8.3.3 Androgens

Testosterone esters (section 6.4.2) have largely been superseded by other drugs for breast cancer.

8.3.4 Hormone antagonists

8.3.4.1 Breast cancer

The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these.

For operable breast cancer, treatment before surgery (neoadjuvant therapy) reduces the size of the tumour and facilitates breast-conserving surgery; hormone antagonist therapy (e.g. letrozole) is chosen for steroid hormone-receptor-positive breast cancer and chemotherapy for steroid hormone-receptor-negative tumours or for younger women.

Early breast cancer
- All women should be considered for adjuvant therapy following surgical removal of the tumour. Adjuvant therapy is used to eradicate the micrometastases that cause relapses. Choice of adjuvant treatment is determined by the risk of recurrence, steroid hormone-receptor status of the primary tumour, and menopausal status.

Adjuvant therapy comprises cytotoxic chemotherapy and hormone-antagonist therapy. Women with steroid hormone-receptor-positive breast cancer are considered for hormone-antagonist therapy (preceded by cytotoxic chemotherapy if necessary) whilst women with steroid hormone-receptor-negative breast cancer should be considered for cytotoxic chemotherapy.

Aromatase inhibitors act predominantly by blocking the conversion of androgens to oestrogens in the peripheral tissues. They do not inhibit ovarian oestrogen synthesis and should not be used in premenopausal women.

Anastrozole and letrozole are non-steroidal aromatase inhibitors; exemestane is a steroidal aromatase inhibitor. Aromatase inhibitors are usually prescribed as initial adjuvant therapy in postmenopausal women with oestrogen-receptor-positive tumours; tamoxifen, an oestrogen-receptor antagonist, is used if an aromatase inhibitor is not appropriate. Adjuvant hormone antagonist therapy should generally be continued for 5 years following removal of the tumour. In postmenopausal women considered for extended adjuvant therapy, 5 years of tamoxifen is followed by letrozole for a further 2–3 years.

Trastuzumab (section 8.1.5) is licensed for use in early breast cancer which overexpresses human epidermal growth factor-2 (HER2) in women who have received surgery, chemotherapy and radiotherapy (as appropriate).

Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin (section 8.3.4.2) or ovarian ablation.

Advanced breast cancer
- Treatment of advanced breast cancer depends on the patient’s drug history and an assessment of disease severity. Aromatase inhibitors, such as anastrozole or letrozole, are the preferred...
treatment in postmenopausal women with oestrogen-receptor-positive advanced breast cancer, a long disease-free interval following treatment for early breast cancer, and disease limited to bone or soft tissues; tamoxifen can be used if aromatase inhibitors are not suitable. Progestogens, such as medroxyprogesterone acetate (section 8.3.2), may be used after aromatase inhibitors and tamoxifen in postmenopausal women.

Tamoxifen should be considered for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen. The gonadorelin analogue goserelin (section 8.3.4.2) is licensed for advanced breast cancer in pre- and perimenopausal women for hormone manipulation.

Cytotoxic chemotherapy is indicated for advanced steroid hormone-receptor-negative tumours and for aggressive disease, particularly when metastases involve visceral sites (e.g. the liver) or if the disease-free interval following treatment for early breast cancer is short.

**Cytotoxic drugs used in breast cancer** An anthracycline combined with fluorouracil (section 8.1.3) and cyclophosphamide (section 8.1.1), and sometimes also with methotrexate (section 8.1.3) is effective. Cyclophosphamide, methotrexate, and fluorouracil can be useful if an anthracycline is inappropriate (e.g. in cardiac disease).

**Metastatic disease** The choice of chemotherapy regimen will be influenced by whether the patient has previously received adjuvant treatment and the presence of any co-morbidity.

For women who have not previously received chemotherapy, an anthracycline (such as doxorubicin or epirubicin) alone or in combination with another cytotoxic drug is the standard initial therapy for metastatic breast disease.

Patients with anthracycline-refractory or resistant disease should be considered for treatment with a taxane (section 8.1.5) either alone or in combination with trastuzumab if they have tumours that overexpress HER2. Other cytotoxic drugs with activity against breast cancer include capcitabine (section 8.1.3), mitoxantrone, mitomycin (both section 8.1.2), and vinorelbine (section 8.1.4). Trastuzumab alone (section 8.1.5) is an option for chemotherapy-resistant cancers that overexpress HER2.

**Other drugs used in breast cancer** Trilastone (section 8.7.3) is licensed for postmenopausal breast cancer. It is quite well tolerated but abdominal discomfort may be a problem. Trilastone causes adrenal hypofunction and corticosteroid replacement therapy is needed.

The use of bisphosphonates (section 6.6.2) in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.

**ANASTROZOLE**

**Indications** adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women; adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmeno-

8.3.4 Hormone antagonists

**ANASTROZOLE**

Indications adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women; adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen.

Cautions laboratory test for menopause if doubt; susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals).

Contra-indications not for premenopausal women.

Hepatic impairment avoid in moderate to severe impairment.

Renal impairment avoid if creatinine clearance less than 20 mL/minute.

Pregnancy avoid.

Breast-feeding avoid.

Side-effects hot flushes, vaginal dryness, vaginal bleeding, hair thinning, anorexia, nausea, vomiting, diarrhea, headache, arthralgia, bone fractures, rash (including Stevens-Johnson syndrome); asthenia and drowsiness—may initially affect ability to drive or operate machinery; slight increases in total cholesterol levels reported; very rarely allergic reactions including angioedema and anaphylaxis.

Dose

- 1 mg daily.

**Arimidex® (AstraZeneca)**

Tablets, f/c, anastrozole 1 mg. Net price 28-tab pack = £88.56.

The Scottish Medicines Consortium (p. 4) has advised (August 2005 and October 2006) that anastrozole (Arimidex®) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

**EXEMESTANE**

**Indications** adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed.

Cautions interactions: Appendix 1 ( exemestane).

Contra-indications not indicated for premenopausal women.

Hepatic impairment manufacturer advises caution.

Renal impairment manufacturer advises caution.

Pregnancy avoid.

Breast-feeding avoid.

Side-effects nausea, vomiting, abdominal pain, dyspepsia, constipation, anorexia; dizziness, fatigue, headache, depression, insomnia; hot flushes, sweating; alopecia, rash; less commonly drowsiness, asthenia, and peripheral oedema; rarely thrombocytopenia, leucopenia.

Dose

- 25 mg daily.

**Aromasin® (Pharmacia)**

Tablets, s/c, exemestane 25 mg, net price 30-tab pack = £88.80, 90-tab pack = £266.40. Label: 21.

The Scottish Medicines Consortium (p. 4) has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.
Fulvestrant

**Indications** treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available

**Breast-feeding** manufacturer advises avoid—increased incidence of fetal abnormalities and death in animal studies

**Pregnancy** manufacturer advises avoid—in present milk in animal studies

**Side-effects** nausea, vomiting, diarrhoea; venous thromboembolism; anorexia, headache, asthenia; urinary-tract infections; hot flushes; back pain; rash, injection-site reactions, hypersensitivity reactions; less commonly vaginal haemorrhage, vaginal candidiasis, and leucorrhoea

**Dose** by deep intramuscular injection into buttock, 500 mg every 2 weeks for the first 3 doses, then 500 mg every month

**Note** 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock

**Faslodex** (AstraZeneca) (BNF 61)

**Injection** (oily), fulvestrant 50 mg/mL, net price 1 × 5-mL (250-mg) prefilled syringe = £348.27, 2 × 5-mL (250-mg) prefilled syringe = £522.41

**Letrozole**

**Indications** adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women; advanced breast cancer in postmenopausal women (including those in whom other anti-oestrogen therapy has failed); early invasive breast cancer in postmenopausal women after standard adjuvant tamoxifen therapy; pre-operative treatment in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy; early invasive breast cancer in women (including those in whom other anti-oestrogens have failed); early invasive breast cancer in women; advanced breast cancer in postmenopausal women (including those in whom other anti-oestrogen therapy has failed); early invasive breast cancer in postmenopausal women who have received tamoxifen. Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly

**Contra-indications** treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

**Pregnancy** avoid—possible effects on fetal development; effective contraception must be used during treatment and for 2 months after stopping

**Breast-feeding** suppress lactation; avoid unless potential benefit outweighs risk

**Side-effects** hot flushes, vaginal bleeding and vaginal discharge (important: see also Endometrial Changes under Cautions), suppression of menstruation in some premenopausal women, pruritus vulvae, gastrointestinal disturbances, headache, light-headedness, tumour flare, decreased platelet counts; occasionally oedema, rarely hypercalcaemia if bony metastases, alopecia, rashes, uterine fibroids; also visual disturbances (including corneal changes, cataracts, retinopathy); leucopenia (sometimes with anaemia and thrombocytopenia), rarely neutropenia; hypertriglyceridaemia reported rarely (sometimes with pancreatitis); thromboembolic events reported (see below); liver enzyme changes (rarely fatty liver, cholestasis, hepatitis); rarely interstitial pneumonitis, hypersensitivity reactions including angioedema, Stevens-Johnson syndrome, bullous pemphigoid; see also notes above

**Risk of thromboembolism** Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures). Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg

**Dose**

- Breast cancer; 20 mg daily
- Anovulatory infertility; 20 mg daily on days 2, 3, 4 and 5 of cycle; if necessary the daily dose may be

---

**TAMOXIFEN**

**Indications** see under Dose and notes above; mastalgia [unlicensed indication] (section 6.7.2)

**Cautions** occasional cystic ovarian swellings in premenopausal women; increased risk of thromboembolic events, especially when used with cytoxotics (see also below); endometrial changes (important: see below); porphyria, interactions: Appendix 1 (tamoxifen)

**Endometrial changes** Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported, prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen. Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly

**Contra-indications** treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

**Pregnancy** avoid—possible effects on fetal development; effective contraception must be used during treatment and for 2 months after stopping

**Breast-feeding** suppress lactation; avoid unless potential benefit outweighs risk

**Side-effects** hot flushes, vaginal bleeding and vaginal discharge (important: see also Endometrial Changes under Cautions), suppression of menstruation in some premenopausal women, pruritus vulvae, gastrointestinal disturbances, headache, light-headedness, tumour flare, decreased platelet counts; occasionally oedema, rarely hypercalcaemia if bony metastases, alopecia, rashes, uterine fibroids; also visual disturbances (including corneal changes, cataracts, retinopathy); leucopenia (sometimes with anaemia and thrombocytopenia), rarely neutropenia; hypertriglyceridaemia reported rarely (sometimes with pancreatitis); thromboembolic events reported (see below); liver enzyme changes (rarely fatty liver, cholestasis, hepatitis); rarely interstitial pneumonitis, hypersensitivity reactions including angioedema, Stevens-Johnson syndrome, bullous pemphigoid; see also notes above

**Risk of thromboembolism** Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures). Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg

**Dose**

- Breast cancer: 20 mg daily
- Anovulatory infertility: 20 mg daily on days 2, 3, 4 and 5 of cycle; if necessary the daily dose may be
increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs.

Tamoxifen (Non-proprietary) 

Tablets, tamoxifen (as citrate) 10 mg, net price 30-tab pack = £3.08; 20 mg, 30-tab pack = £2.09; 40 mg, 30-tab pack = £1.12.

Oral solution, tamoxifen (as citrate) 10 mg/5 mL, net price 150 mL = £29.61.

Brands include: Sofihorm®

Toremifene

Indications hormone-dependent metastatic breast cancer in postmenopausal women.

Cautions hypercalcaemia may occur (especially if bone metastases and usually at beginning of treatment); avoid in acute porphyria (but see section 9.8.2); history of severe thromboembolic disease; interac-
tions: Appendix 1 (toremifene).

Endometrial changes Increased endometrial changes, including hyperplasia, polyps and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated.

Contra-indications endometrial hyperplasia, QT prolongation (avoid concomitant administration of drugs that prolong QT interval), electrolyte disturbances (particularly uncorrected hypokalaemia), bradycardia, heart failure with reduced left-ventricular ejection fraction, history of arrhythmias.

Hepatic impairment elimination decreased in hepatic impairment—avoid if severe.

Pregnancy avoid.

Breast-feeding avoid.

Side-effects nausea, vomiting; oedema; depression, dizziness, fatigue; sweating, hot flushes, vaginal bleeding or discharge (important: see Cautions); rash; less common anorexia, constipation, increased weight, thromboembolic events, dyspnoea, insomnia, headache, endometrial hypertrophy; very rarely jaundice, transient corneal opacity, and alopecia.

Dose

• 60 mg daily.

Fareston® (Orion) 

Tablets, toremifene (as citrate) 60 mg. Net price 30-tab pack = £29.08.

8.3.4 Hormone antagonists 571

Gonadorelin analogues

Gonadorelin analogues are as effective as orchidectomy or diethylstibestrol (section 8.3.1) but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of luteinising hormone release by the pituitary. During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide (see below) are recommended; anti-androgen treatment should be started before the gonadorelin analogue. Gonadorelin analogues are also used in women for breast cancer (section 8.3.4.1) and other indications (section 6.7.2).

The Scottish Medicines Consortium (p. 4) has advised (June 2009) that histrelin (Vantas®) is accepted for restricted use within NHS Scotland for the palliative treatment of advanced prostate cancer in patients with an anticipated life expectancy of at least one year in whom annual administration will offer advantages.

Cautions Men at risk of tumour ‘flare’ (see above) should be monitored closely during the first month of therapy. Caution is required in patients with metabolic bone disease because reduced bone mineral density can occur. The injection site should be rotated.

Side-effects The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men and include hot flushes and sweating, sexual dysfunction, vaginal dryness or bleeding, and gynaecomastia or changes in breast size. Signs and symptoms of prostate or breast cancer may worsen initially (managed in prostate cancer with anti-androgen(s), see above). Other side-effects include hypersensitivity reactions (rashes, pruritus, asthma, and rarely anaphylaxis), injection site reactions (see Cautions), headache (rarely migraine), visual disturbances, dizzi-
ness, arthralgia and possibly myalgia, hair loss, periph-
eral oedema, gastro-intestinal disturbances, weight changes, sleep disorders, and mood changes.

Buserelin

Indications advanced prostate cancer; other indica-
tions (section 6.7.2).

Cautions diabetes, hypertension, depression; see also notes above.

Side-effects see notes above; worsening hyper-
tension, palpitation, glucose intolerance, altered blood lipids, thrombocytopenia, leucopenia, nervousness, fatigue, memory and concentration disturbances, anxiety, increased thirst, hearing disorders, quinacrine-
skull pain; nasal irritation, nose bleeds and altered sense of taste and smell (spray formulation only).

Dose

• By subcutaneous injection. 500 micrograms every 8 hours for 7 days, then intranasally, 1 spray into each nostril 6 times daily (see also notes above).

Counselling Avoid use of nasal decongestants before and for at least 30 minutes after treatment.

Suprefact® (Sanofi-Aventis) 

Injection buserelin (as acetate) 1 mg/mL. Net price 2 × 5.5-mL vial = £23.69.
Hormone antagonists

**GOSERELIN**

**Indications** locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; advanced breast cancer; oestrogen-receptor-positive early breast cancer (section 8.3.4.1); endometriosis, endometrial thinning, uterine fibroids, assisted reproduction (section 6.7.2)

**Cautions** see notes above; diabetes; risk of ureteric obstruction and spinal cord compression in men

**Contra-indications** undiagnosed vaginal bleeding

**Pregnancy** see Goserelin, section 6.7.2

**Breast-feeding** see Goserelin, section 6.7.2

**Side-effects** see notes above; also transient changes in blood pressure; paraesthesia; rarely hypercalcaemia (in patients with metastatic breast cancer)

**Dose**
- See under preparations below

**Novogs® (Genus)**

**Implant** goserelin (as acetate) 3.6 mg in prefilled syringe, net price = £58.50

**Dose** advanced prostate cancer by subcutaneous injection into anterior abdominal wall, 3.6 mg every 28 days

**Zoladex® (AstraZeneca)**

**Implant** goserelin (as acetate) 3.6 mg in SafeSystem® syringe applicator, net price each = £65.00

**Dose** breast cancer and prostate cancer (see indications above) by subcutaneous injection into anterior abdominal wall, 3.6 mg every 28 days

**Zoladex® LA (AstraZeneca)**

**Implant** goserelin (as acetate) 10.8 mg in SafeSystem® syringe applicator, net price each = £235.00

**Dose** prostate cancer (see indications above), by subcutaneous injection into anterior abdominal wall, 10.8 mg every 12 weeks

**HISTRELIN**

**Indications** advanced prostate cancer

**Cautions** see notes above; risk of ureteric obstruction and spinal cord compression

**Side-effects** see notes above; also hepatic disorder, dyspnoea, depression, asthma, elevated blood glucose-concentration, increased urinary frequency, hypertrichosis; less commonly hypercholesterolaemia, palpitation, ventricular extrasystole, haemato ma, tremor, anaemia, renal failure, nephrolithiasis, hypercalcaemia

**Dose**
- By subcutaneous implantation into upper arm, 1 implant (50 mg) every 12 months; remove after 12 months of treatment

**Counselling** Avoid wetting arm containing implant for 24 hours and avoid lifting heavy objects or strenuous physical activity for 7 days after implantation

**LEUPRORELIN ACETATE**

**Indications** locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; endometriosis, endometrial thinning, uterine fibroids (section 6.7.2)

**Cautions** see notes above and section 6.7.2; risk of ureteric obstruction and spinal cord compression in men

**Side-effects** see notes above and section 6.7.2; also fatigue, muscle weakness, paraesthesia, hypertension, palpitation, alteration of glucose tolerance and of blood lipids; hypotension, jaundice, thrombocytopenia and leucopenia reported

**Dose**
- See under preparations below

**Prostap® SR (Takeda)**

**Injection** (microsphere powder for reconstitution), leuprorelin acetate, net price 3.75-mg vial with 1-mL vehicle-filled syringe = £75.24

**Dose** prostate cancer (see indications), by subcutaneous or by intramuscular injection, 3.75 mg every 4 weeks

**Prostap® 3 (Takeda)**

**Injection** (microsphere powder for reconstitution), leuprorelin acetate, net price 11.25-mg vial with 2-mL vehicle-filled syringe = £225.72

**Dose** prostate cancer (see indications), by subcutaneous injection, 11.25 mg every 3 months

**TRIPTORELIN**

**Indications** prostate cancer; endometriosis, precocious puberty, reduction in size of uterine fibroids (section 6.7.2)

**Cautions** see notes above; risk of ureteric obstruction and spinal cord compression in men

**Side-effects** see notes above; also dry mouth, transient hypertension, paraesthesia, and increased dysuria

**Dose**
- See under preparations below

**Decapeptyl® SR (Ipsen)**

**Injection** (powder for suspension), m/r, triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00

**Dose** locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, by intramuscular injection, 3 mg every 4 weeks

**Note** Each vial includes an overage to allow accurate administration of a 3-mg dose

**Injection** (powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

**Dose** locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, by intramuscular injection, 11.25 mg every 3 months (see also notes above)

**Note** Each vial includes an overage to allow accurate administration of an 11.25-mg dose
to the clinical circumstances. either alone or as an adjunct to other therapy. Bicalutamide is used for prostate cancer which may occur after commencing gonadorelin analogue administration. Cyproterone acetate and flutamide are also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy. Bicalutamide is used for prostate cancer either alone or as an adjunct to other therapy, according to the clinical circumstances.

### BICALUTAMIDE

**Indications** locally advanced prostate cancer at high risk of disease progression, either alone or as adjuvant treatment to prostatectomy or radiotherapy; locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate; advanced prostate cancer in combination with gonadorelin analogue or surgical castration.

**Cautions** consider periodic liver function tests; interactions: Appendix 1 (bicalutamide)

**Hepatic impairment** increased accumulation possible in moderate to severe impairment.

**Side-effects** nausea, diarrhoea, cholestasis, jaundice; asthenia, weight gain; gynaecomastia, breast tenderness; hot flushes, impotence, decreased libido; anaemia; alopecia, dry skin, hirsutism, pruritus; less commonly vomiting, abdominal pain, dyspepsia, interstitial lung disease, pulmonary fibrosis, depression, haematuria, thrombocytopenia, hypersensitivity reactions including angioneurotic oedema and urticaria; rarely cardiovascular disorders (including angina, heart failure, and arrhythmias), and hepatic failure.

**Dose**
- Locally advanced prostate cancer at high risk of disease progression, 150 mg once daily
- Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate, 150 mg once daily
- Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration, 50 mg once daily (started at the same time as surgical castration or at least 3 days before gonadorelin therapy, see also notes above)

**Bicalutamide** (Non-proprietary)

- Tablets, bicalutamide 50 mg, net price 28-tab pack = £8.62; 150 mg, 28-tab pack = £12.21
- Casodex® (AstraZeneca)

- Tablets, 1/2, bicalutamide 50 mg, net price 28-tab pack = £128.00; 150 mg, 28-tab pack = £240.00

### CYPROTERONE ACETATE

**Indications** prostate cancer, see under Dose and also notes above; other indications, see section 6.4.2

**Cautions** in prostate cancer, blood counts initially and throughout treatment; monitor hepatic function (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; risk of recurrence of thromboembolic disease; diabetes mellitus, sickle-cell anaemia, severe depression (in other indications some of these are contra-indicated, see section 6.4.2)

**Driving** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

**Contra-indications** patients with meningioma or history of meningioma; for contra-indications relating to other indications see section 6.4.2

**Hepatic impairment** dose-related toxicity; see also under cautions (above) and side-effects (below)

**Side-effects** see section 6.4.2

**Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (usually after several months) in patients treated with cyproterone acetate 200–300 mg daily. Liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur—if confirmed cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk)

**Dose**
- Prevention of flare with initial gonadorelin analogue therapy. 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; max. 300 mg daily
- Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred, 200–300 mg daily in 2–3 divided doses
- Hot flushes with gonadorelin analogue therapy or after orchidectomy, initially 50 mg daily, adjusted according to response to 50–150 mg daily in 1–3 divided doses

**Cyproterone Acetate** (Non-proprietary)

- Tablets, cyproterone acetate 50 mg, net price 56-tab pack = £31.54; 100 mg, 84-tab pack = £85.72.
- Label: 21, counselling, driving

**Cyprostat®** (Bayer Schering)

- Tablets, scored, cyproterone acetate 50 mg, net price 168-tab pack = £73.23; 100 mg, 84-tab pack = £73.23.
- Label: 21, counselling, driving

### FLUTAMIDE

**Indications** advanced prostate cancer, see also notes above

**Cautions** cardiac disease (oedema reported); also liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anorexia, jaundice, abdominal pain, unexplained influenza-like symptoms); avoid excessive alcohol consumption; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (flutamide)

**Hepatic impairment** use with caution (hepatotoxic)

**Side-effects** gynaecomastia (sometimes with galactorrhoea); nausea, vomiting, diarrhoea, increased appetite, insomnia, tiredness; other side-effects reported include decreased libido, reduced sperm count, gastric and chest pain, hypertension, headache, dizziness, oedema, blurred vision, thirst,
rash, pruritus, haemolytic anaemia, systemic lupus erythematosus-like syndrome, and lymphohaedema; hepatic injury (with transaminase abnormalities, cholestatic jaundice, hepatic necrosis, hepatic encephalopathy and occasional fatalality) reported

**Dose**
- 250 mg 3 times daily (see also notes above)

**Flutamide** (Non-proprietary) [\textregistered]

**Tablets**, flutamide 250 mg. Net price 84-tab pack = £22.24

---

**8.3.4 Hormone antagonists**

**Gonadotrophin-releasing hormone antagonists**

**Degarelix** is a gonadotrophin-releasing hormone antagonist used to treat advanced hormone-dependent prostate cancer. It does not induce a testosterone surge or tumour ‘flare’, therefore anti-androgen therapy is not required.

**DEGARELIX**

**Indications** see notes above

**Cautions** susceptibility to QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval); monitor bone density; diabetes

**Hepatic impairment** manufacturer advises caution in severe impairment—no information available

**Renal impairment** manufacturer advises caution in severe impairment—no information available

**Side-effects** nausea; dizziness, headache, drowsiness, insomnia, ashenia; influenza-like symptoms; hot flushes, sweating (including night sweats), weight gain; injection-site reactions; less commonly diarrhoea, vomiting, abdominal discomfort, dry mouth, constipation, anorexia; atrio-ventricular block, QT-interval prolongation, fainting, hypertension, hypersensitivity reactions, depression, anxiety, oedema, gynaecomastia, micturition urgency, renal impairment, sexual dysfunction, pelvic pain, prostatitis, testicular pain, anaemia, musculoskeletal pain, tinnitus, urticaria, alopecia, and rash

**Dose**
- By subcutaneous injection into the abdominal region, **ADULT** over 18 years, initially 240 mg (administered as 2 injections of 120 mg), then 80 mg every 28 days

**Firmagon** [\textregistered] (Ferring) [\textregistered]

**Injection**, powder for reconstitution, degarelix (as acetate), net price 80-mg vial (with diluent) = £129.37; 2 × 120-mg vials (with diluent) = £260.00

---

**8.3.4.3 Somatostatin analogues**

**Lanreotide** and **octreotide** are analogues of the hypothalamic release-inhibiting hormone somatostatin. They are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery; octreotide may also be valuable in reducing vomiting in palliative care (see p. 23) and in stopping variceal bleeding [unlicensed indication]—see also vasopressin and terlipressin (section 6.5.2).

**Cautions** Growth hormone-secreting pituitary tumours can expand causing serious complications; during treatment with somatostatin analogues patients should be monitored for signs of tumour expansion (e.g. visual field defects). Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment (avoid abrupt withdrawal of short-acting octreotide—see Side-effects below). In insulinoma an increase in the depth and duration of hypoglycaemia may occur (observe patients when initiating treatment and changing doses); in diabetes mellitus, insulin or oral antidiabetic requirements may be reduced.

**Side-effects** Gastro-intestinal disturbances including anorexia, nausea, vomiting, abdominal pain and bloating, flatulence, diarrhoea, and steatorrhoea may occur (administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects). Postprandial glucose tolerance may be impaired and rarely persistent hyperglycaemia occurs with chronic administration; hypoglycaemia has also been reported. Gallstones have been reported after long-term treatment (abrupt withdrawal of subcutaneous octreotide is associated with biliary colic and pancreatitis). Pain and irritation may occur at the injection site and sites should be rotated. Rarely, pancreatitis has been reported shortly after administration.

**Lanreotide**

**Indications** see notes above

**Cautions** see notes above; **interactions**: Appendix 1 (lanreotide)

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** see notes above; also reported asthenia, fatigue, raised bilirubin; less commonly skin nodule, hot flushes, leg pain, malaise, headache, tenesmus, decreased libido, drowsiness, pruritus, increased sweating; rarely hypothyroidism (monitor as necessary)

**Dose**
- See under preparations

**Somatuline** [\textregistered] **LA** (**Ipsen**) [\textregistered]

**Injection** (copolymer microparticles for aqueous suspension), lanreotide (as acetate) 30-mg vial (with vehicle) = £323.00

**Dose** by intramuscular injection, acromegaly and neuroendocrine (particularly carcinoid) tumours, initially 30 mg every 14 days, frequency increased to every 7–10 days according to response

Thyroid tumours, 30 mg every 14 days, frequency increased to every 10 days according to response

**Somatuline Autogel** (**Ipsen**) [\textregistered]

**Injection**, prefilled syringe, lanreotide (as acetate) 60 mg = £551.00; 90 mg = £736.00; 120 mg = £937.00

**Dose** by deep subcutaneous injection into the gluteal region, acromegaly (if somatostatin analogue not given previously), initially 60 mg every 28 days, adjusted according to response, for patients treated previously with somatostatin analogue, consult product literature for initial dose

Neuroendocrine (particularly carcinoid) tumours, initially 60–120 mg every 28 days, adjusted according to response
OCTREOTIDE

Indications  
see under Dose

Cautions  
see notes above; monitor thyroid function on long-term therapy; interactions: Appendix 1 (octreotide)

Hepatic impairment  
adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis

Pregnancy  
possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk and effective contraception required during treatment

Breast-feeding  
manufacturer advises avoid unless essential—present in milk in animal studies

Side-effects  
see notes above; also bradycardia, dyspnoea, headache, dizziness, alopecia, rash; hepatitis also reported

Dose  
- Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas, by subcutaneous injection, initially 50 micrograms once or twice daily, gradually increased according to response to 200 micrograms 3 times daily (higher doses required exceptionally); maintenance doses variable; in carcinoid tumours discontinue after 1 week if no effect; if rapid response required, initial dose by intravenous injection (with ECG monitoring and after dilution to a concentration of 10–50% with sodium chloride 0.9% injection)
- Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective by subcutaneous injection, 100–200 micrograms 3 times daily; discontinue if no improvement within 3 months
- Prevention of complications following pancreatic surgery, consult product literature

Octreotide (Non-proprietary)  
Injection, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £3.72; 100 micrograms/mL, 1-mL amp = £6.53; 200 micrograms/mL, 5-mL vial = £69.66; 500 micrograms/mL, 1-mL amp = £33.87

Sandostatin  
Injection, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £2.98; 100 micrograms/mL, 1-mL amp = £5.60; 200 micrograms/mL, 5-mL vial = £69.66; 500 micrograms/mL, 1-mL amp = £27.10

Depot preparation  
Sandostatin Lar  
Injection (microsphere powder for aqueous suspension), octreotide (as acetate) 10-mg vial = £637.50; 20-mg vial = £850.00; 30-mg vial = £1062.50 (all supplied with 2.5-mL diluent-filled syringe)

Dose  
acromegaly (test dose by subcutaneous injection 50–100 micrograms if subcutaneous octreotide not previously given), neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide, by deep intramuscular injection into gluteal muscle, initially 20 mg every 4 weeks for 3 months then adjusted according to response; max. 30 mg every 4 weeks

For acromegaly, start depot octreotide 1 day after the last dose of subcutaneous octreotide (for pituitary surgery give last dose of depot octreotide at least 3 weeks before surgery), for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

9.8.2 Acute porphyrias

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

9.1.1.1 Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route. Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of
preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulphate, 200 mg (≈ 65 mg elemental iron) three times daily; for prophylaxis of iron-deficiency anaemia, a dose of ferrous sulphate 200 mg once or twice daily may be effective. For treatment of iron-deficiency anaemia in children and for prophylaxis of iron-deficiency anaemia in babies of low birth weight, see BNF for Children.

Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the reference range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

Side-effects Gastro-intestinal irritation can occur with iron salts. Nausea and epigastric pain are dose-related, but the relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease. Iron preparations taken orally can be constipating, particularly in older patients and occasionally lead to faecal impaction.

If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulphate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron. Iron preparations taken orally can be constipating, particularly in older patients and occasionally lead to faecal impaction.

Iron preparations are a common cause of accidental overdose in children. For the treatment of iron overdose, see Emergency Treatment of Poisoning, p. 38.

Counselling Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects; they may discolour stools.

Compound preparations Preparations containing iron and folic acid are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy (see p. 580).

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain ascorbic acid to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins (except folic acid for pregnant women, see notes above and on p. 580).

Modified-release preparations Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

**FERROUS SULPHATE**

**Indications** iron-deficiency anaemia

**Cautions interactions:** Appendix 1 (iron)

**Side-effects** see notes above

**Dose**

- See under preparations below and notes above

**Ferrous Sulphate (Non-proprietary)**

- **Tablets**, coated, dried ferrous sulphate 200 mg (65 mg iron), net price 28-tab pack = £1.15
- **Dose** prophylactic, 1 tablet daily; therapeutic, 1 tablet 2–3 times daily; **CHILD**, see BNF for Children

**Ironorm** Drops (Wallace Mfg)

- **Oral drops**, ferrous sulphate 125 mg (25 mg iron)/mL, net price 15-mL = £4.95
- **Dose** ADULT and **CHILD** over 6 years, prophylactic, 0.6 mL daily; **CHILD** under 6 years, see BNF for Children

**Modified-release preparations**

- **Feospan** (Intrapharm)
- **Spansule** (= capsules m/r), clear/red, enclosing green and brown pellets, dried ferrous sulphate 150 mg (47 mg iron), net price 30-cap pack = £2.11. Label: 25
- **Dose** 1–2 capsules daily; **CHILD** over 1 year, 1 capsule daily; can be opened and sprinkled on food

- **Ferrograd** (Teofarma)
- **Tablets**, f/c, m/r, red, dried ferrous sulphate 325 mg (105 mg iron), net price 30-tab pack = £1.84. Label: 25
- **Dose** ADULT and **CHILD** over 12 years, prophylactic and therapeutic, 1 tablet daily before food

**With folic acid**

For prescribing information on folic acid, see section 9.1.2

**Fefol** (Intrapharm)

- **Spansule** (= capsules m/r), clear/green, enclosing brown, yellow, and white pellets, dried ferrous sulphate 150 mg (47 mg iron), folic acid 500 micrograms, net price 30-cap pack = £1.69. Label: 25
- **Dose** 1 capsule daily
9.1.1 Iron-deficiency anaemias

Ferrograd Folic® (Teofarma)
Tablets, f/c, red/yellow, dried ferrous sulphate 325 mg (105 mg iron) for sustained release, folic acid 350 micrograms, net price 30-tab pack = £1.89.
Label: 25
Dose ADULT and CHILD over 12 years, 1 tablet daily before food.

With ascorbic acid
For prescribing information on ascorbic acid, see section 9.6.3

Ferrograd C® (Teofarma)
Tablets, f/c, red, dried ferrous sulphate 325 mg (105 mg iron) for sustained release, ascorbic acid 500 mg (as sodium salt), net price 30-tab pack = £1.85.
Label: 25
Dose ADULT and CHILD over 12 years, 1 tablet daily before food.

FERROUS FUMARATE
Indications iron-deficiency anaemia
Cautions interactions: Appendix 1 (iron)
Side-effects see notes above
Dose
See under preparations below and notes above

Fersaday® (Goldshield)
Tablets, brown, f/c, ferrous fumarate 322 mg (100 mg iron), net price 28-tab pack = 79p
Dose prophylactic, 1 tablet daily; therapeutic, 1 tablet twice daily

Fersanal® (Goldshield)
Tablets, brown, ferrous fumarate 210 mg (68 mg iron), net price 100 = £1.44
Dose prophylactic, 1 tablet 1–2 times daily; therapeutic, 1 tablet 2–3 times daily

Syrup, brown, ferrous fumarate approx. 140 mg (45 mg iron)/5 mL, net price 200 = £3.11
Dose prophylactic, 5 mL twice daily; therapeutic, 10 mL twice daily; CHILD see BNF for Children

Galfer® (Thorton & Ross)
Capsules, red/green, ferrous fumarate 305 mg (100 mg iron), net price 100 = £2.00
Dose ADULT and CHILD over 12 years, prophylactic, 1 capsule daily; therapeutic, 1 capsule twice daily

Syrop, brown, sugar-free ferrous fumarate 140 mg (45 mg iron)/5 mL, net price 200 = £3.11
Dose prophylactic, 5 mL twice daily; therapeutic, 10 mL twice daily; CHILD see BNF for Children

Galfer FA® (Thorton & Ross)
Capsules, red/yellow, ferrous fumarate 305 mg (100 mg iron), folic acid 350 micrograms, net price 100 = £2.17
Dose 1 capsule daily before food

Pregaday® (UCB Pharma)
Tablets, brown, f/c, ferrous fumarate equivalent to 100 mg iron, folic acid 350 micrograms, net price 28-tab pack = £1.20
Dose 1 tablet daily

FERROUS GLUCONATE
Indications iron-deficiency anaemia
Cautions interactions: Appendix 1 (iron)
Side-effects see notes above
Dose
See under preparation below and notes above

Ferrous Glucenate (Non-proprietary)
Tablets, red, coated, ferrous glucenate 300 mg (35 mg iron), net price 28 = £2.95
Dose prophylactic, 2 tablets daily before food; therapeutic, 4–6 tablets daily in divided doses before food; CHILD 6–12 years, prophylactic and therapeutic, 1–3 tablets daily

POLYSACCHARIDE–IRON COMPLEX
Indications iron-deficiency anaemia
Cautions interactions: Appendix 1 (iron)
Side-effects see notes above
Dose
See under preparation below and notes above

Niferex® (Tillomed)
Elixir, brown, sugar-free, polysaccharide–iron complex equivalent to 100 mg of iron/5 mL, net price 240-mL pack = £6.06; 30-mL dropper bottle for paediatric use = £2.16. Counselling, use of dropper
Dose prophylactic, 2.5 mL daily; therapeutic, 5 mL 1–2 times daily (once daily if required during second and third trimester of pregnancy); PRETERM NEONATE, NEONATE, and INFANT (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily; CHILD 2–6 years 2.5 mL daily, 6–12 years 5 mL daily

SODIUM FEREDATE
(Sodium ironedetate)
Indications iron-deficiency anaemia
Cautions interactions: Appendix 1 (iron)
Side-effects see notes above
Dose
See under preparation below and notes above

Sytron® (Archimedes)
Elixir, sugar-free, sodium feredetate 190 mg equivalent to 27.5 mg of iron/5 mL, net price 100 mL = £1.07
Dose therapeutic, 5 mL increasing gradually to 10 mL 3 times daily; CHILD under 1 year, see BNF for Children; CHILD 1–5 years, therapeutic, 2.5 mL 3 times daily, 6–12 years, therapeutic, 5 mL 3 times daily

9.1.1.2 Parenteral iron
Iron can be administered parenterally as iron dextran, iron sucrose, ferric carboxymaltose or iron isomaltoside 1000. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance, p. 583).
Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis (see also Erythropoietins, section 9.1.3).

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately.

Anaphylactic reactions can occur with parenteral administration of iron complexes. Depending on the preparation, patients may be required to have a small test dose initially, see preparations for details; facilities for cardiopulmonary resuscitation must be available.

**FERRIC CARBOXYMALTOSE**
A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available; oral iron should not be given concomitantly; allergic disorders including asthma and eczema; infection (discontinue if ongoing bacteremia); interactions: Appendix 1 (iron)

**Hepatic impairment** use with caution; avoid in conditions where iron overload increases risk of impairment

**Pregnancy** avoid in first trimester; crosses the placenta in animal studies; may influence skeletal development

**Side-effects** gastro-intestinal disturbances; headache, dizziness; rash; injection-site reactions; hepatitis can occur with parenteral iron infusion (see Anaphylaxis above), numbness, cramps, blurred vision, pruritus, and rash; rarely diarrhoea, chest pain, hypotension, angioedema, arthralgias, tachycardia, dizziness, restlessness, fatigue, seizures, tremor, impaired consciousness, myalgia, arthralgia, sweating, and injection-site reactions; very rarely hypertension, palpitation, headache, paraesthesia, haemolysis, and transient deafness

**Dose**
- By slow intravenous injection into the gluteal muscle or by slow intravenous injection or by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature

**Cosmofer® (Vitaline)**

**Injection**, iron (as iron dextran) 50 mg/mL, net price 2-mL amp = £7.97, 10-mL amp = £39.85

**IRON ISOMALTOSIDE 1000**
A complex of ferric iron and isomaltosides containing 10% (100 mg/mL) of iron

**Indications** iron deficiency anaemia, see notes above

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available—risk of allergic reactions increased in immune or inflammatory conditions; oral iron therapy should not be given until 5 days after last injection; infection (discontinue if ongoing bacteremia)

**Contra-indications** history of allergic disorders including asthma, and eczema; active rheumatoid arthritis

**Hepatic impairment** avoid in severe impairment

**Renal impairment** avoid in acute renal failure

**Pregnancy** avoid in first trimester

**Side-effects** less commonly nausea, vomiting, abdominal pain, flushing, dyspnoea, anaphylactic reactions (see Anaphylaxis above), numbness, cramps, blurred vision, pruritus, and rash; rarely diarrhoea, chest pain, hypotension, angioedema, arthralgias, tachycardia, dizziness, restlessness, fatigue, seizures, tremor, impaired consciousness, myalgia, arthralgia, sweating, and injection-site reactions; very rarely hypertension, palpitation, headache, paraesthesia, haemolysis, and transient deafness

**Dose**
- By deep intramuscular injection into the gluteal muscle or by slow intravenous injection or by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature

**Monofer® (Vitaline)**

**Injection**, iron (as iron isomaltoside 1000) 100 mg/mL, net price 1-mL vial = £16.95, 5-mL vial = £84.75, 10-mL vial = £169.50

**IRON DEXTRAN**
A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** oral iron not to be given until 5 days after last injection; interactions: Appendix 1 (iron)

Anaphylaxis Anaphylactic reactions can occur with parenteral iron and a test dose is recommended before each dose; the patient should be carefully observed for 60 minutes after the first test dose and for 15 minutes after subsequent test doses (subsequent test doses not necessary for intramuscular administration). Facilities for cardiopulmonary resuscitation must be available; risk of allergic reactions increased in immune or inflammatory conditions
In megaloblastic anemias, most result from a lack of either vitamin B12 or folate, and it is essential to establish the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while results are available. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anemia in the UK is pernicious anemia in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B12. Vitamin B12 is also needed in the treatment of megaloblastic caused by prolonged nitrous oxide anesthesia, which inactivates the vitamin, and in the rare syndrome of congenital transcobalamin II deficiency.

Vitamin B12 should be given prophylactically after total gastrectomy or total ileal resection (or after partial gastrectomy if a vitamin B12 absorption test shows vitamin B12 malabsorption). Apart from dietary deficiency, all other causes of vitamin B12 deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B12 orally and none for vitamin B12 intrinsic factor complexes given by mouth. Vitamin B12 in larger oral doses of 1–2 mg daily [unlicensed] may be effective.

Hydroxocobalamin has completely replaced cyanocobalamin as the form of vitamin B12 of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B12 neuropathy.

Folic acid has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anemia unless vitamin B12 is administered concurrently otherwise neuropathy may be precipitated (see above).

In folate-deficient megaloblastic anemia (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in chronic haemolytic states, malabsorption, or in renal dialysis, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

For prophylaxis in pregnancy, see Prevention of Neural Tube Defects below.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn’s disease (see section 1.5.3, p. 65), rheumatic disease (see section 10.1.3, p. 645), and severe psoriasis (see section 13.5.3, p. 721).

Folic acid is also effective in the treatment of folate-deficient megaloblastic anemia but it is generally used in association with cytotoxic drugs (see section 8.1); it is given as calcium folinate.

Prevention of neural tube defects Folic acid supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement at a dose of 400 micrograms daily before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.
- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if they...
woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines (see also section 4.8.1).

Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid 5 mg daily and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid 5 mg daily (or to increase the dose to 5 mg daily) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

HYDROXOCOBALAMIN

Indications see under dose below; cyanide poisoning (see Emergency Treatment of Poisoning, p. 39)

Cautions should not be given before diagnosis fully established but see also notes above; interactions: Appendix 1 (hydroxocobalamin)

Breast-feeding present in milk but not known to be harmful

Side-effects nausea, headache, dizziness; fever, hypersensitivity reactions (including rash and pruritus); injection-site reactions; hypokalaemia and thrombocytosis during initial treatment; chromaturia

Dose

- By intramuscular injection, pernicious anaemia and other macrocytic anaemias without neurological involvement, initially 1 mg 3 times a week for 2 weeks then 1 mg every 3 months
- Pernicious anaemia and other macrocytic anaemias with neurological involvement, initially 1 mg on alternate days until no further improvement, then 1 mg every 2 months
- Prophylaxis of macrocytic anaemias associated with vitamin B₁₂ deficiency, 1 mg every 2–3 months
- Tobacco amblyopia and Leber's optic atrophy, initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, thereafter 1 mg every 1–3 months

CHILD see BNF for Children

Hydroxocobalamin (Non-proprietary)

Injection, hydroxocobalamin 1 mg/mL. Net price 1 mL amp = £1.67

Note The BP directs that when vitamin B₁₂ injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

Brands include Cobalamin-I², Neo-Cytamen®

FOLIC ACID

Indications see notes above and under dose

Cautions should never be given alone for pernicious anaemia and other vitamin B₁₂ deficiency states (may precipitate subacute combined degeneration of the spinal cord); interactions: Appendix 1 (folates)

Side-effects rarely gastro-intestinal disturbances

Dose

- Folate-deficient megaloblastic anaemia, by mouth, ADULT over 1 year, 5 mg daily for 4 months (until term in pregnant women); up to 15 mg daily may be required in malabsorption states; CHILD under 1 year, 500 micrograms/kg daily (max. 5 mg) for up to 4 months; up to 10 mg daily may be required in malabsorption states
- Prevention of neural tube defects, by mouth, see notes above
- Prevention of methotrexate-induced side-effects in severe Crohn's disease [unlicensed], by mouth, see section 1.5.3
- Prevention of methotrexate-induced side-effects in rheumatic disease [unlicensed], by mouth, ADULT over 18 years 5 mg once weekly; CHILD 2–18 years see BNF for Children
- Prevention of methotrexate-induced side-effects in severe psoriasis [unlicensed], by mouth, see section 13.5.3
- Prophylaxis in chronic haemolytic states, by mouth, ADULT 5 mg every 1–7 days depending on underlying disease
- Prophylaxis of folate deficiency in dialysis, by mouth, ADULT 5 mg every 1–7 days; CHILD 1–12 years 250 micrograms/kg (max. 10 mg) once daily, CHILD 12–18 years 5–10 mg once daily

1 Folic Acid (Non-proprietary)

Tablets, folic acid 400 micrograms, net price 90-tab pack = £2.37; 5 mg, 28-tab pack = £1.00

Injection, folic acid 15 mg, net price 1-mL amp = £1.34

Available from 'special-order' manufacturers or specialist importing companies, see p. 988

2. Can be sold to the public provided daily doses do not exceed 500 micrograms
9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids (section 6.4.3), pyridoxine, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired aplastic anaemia; the response rate may be increased when ciclosporin is given as well. Severe reactions are common in the first 2 days and profound immunosuppression may occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from ‘special order’ manufacturers or specialist importing companies, see p. 988) can be used in aplastic anaemia at a dose of 1–5 mg/kg daily for 3 to 6 months. It is unlikely that dietary deprivation of pyridoxine (section 9.6.2) produces clinically relevant haematological effects. However, certain forms of sideroblastic anaemia respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine is indicated in both idiopathic acquired and hereditary sideroblastic anaemias. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high, up to 400 mg daily. Reversible sideroblastic anaemias respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid treatment, pyridoxine is also indicated.

Corticosteroids (see section 6.3) have an important place in the management of a wide variety of haematological disorders. They include conditions with an immune basis such as autoimmune haemolytic anaemia, immune thrombocytopenias and neutropenias, and major transfusion reactions. They are also used in chemotherapy schedules for many types of lymphoma, lymphoid leukaemias, and paraproteinaemias, including multiple myeloma.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat symptomatic anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy. Epoetin beta is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol (see Excipients, p. 2).

Darbeopoin is a hyperglycosylated derivative of epoetin; it has a longer half-life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients. Aluminium toxicity, concurrent infection, or other inflammatory disease can impair the response to erythropoietin.

MHRA/CHM advice (December 2007) Erythropoietins—haemoglobin concentration

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present;
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL;
- haemoglobin concentrations higher than 12 g/100 mL should be avoided;
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range).

See also MHRA/CHM advice below.

MHRA/CHM advice (December 2007 and July 2008) Erythropoietins—tumour progression and survival in patients with cancer

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of symptomatic anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy;
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis.

See also MHRA/CHM advice above.

Pure red cell aplasia

There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.
NICE guidance
Epoetin alfa, beta and darbepoetin alfa for cancer treatment-induced anaemia (May 2008)

Erythropoietin analogues are not recommended for routine use in the management of cancer treatment-induced anaemia, but may be considered, in combination with intravenous iron, for:

- women receiving platinum-based chemotherapy for ovarian cancer who have symptomatic anaemia with a haemoglobin concentration of 8 g/100 mL or lower (the use of erythropoietin analogues does not preclude the use of existing approaches to the management of anaemia, including blood transfusion when necessary);
- patients who cannot be given blood transfusions and who have profound cancer treatment-related anaemia that is likely to have an impact on survival.

Patients currently treated with erythropoietin analogues for the management of cancer treatment-related anaemia who do not fulfil the criteria outlined above can continue therapy until they and their specialists consider it appropriate to stop.

DARBEPOETIN ALFA

Indications see under Dose below
Cautions see Epoetin
Contra-indications see Epoetin

Hepatic impairment manufacturer advises caution
Pregnancy no evidence of harm in animal studies—manufacturer advises caution
Breast-feeding manufacturer advises avoid—no information available
Side-effects see Epoetin; also, oedema, injection-site pain; isolated reports of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue therapy)—see also notes above

Dose

- Symptomatic anaemia associated with chronic renal failure in patients on dialysis (see also MHRA/CHM advice, p. 582), ADULT and CHILD over 11 years, by subcutaneous or intravenous injection, initially 450 nanograms/kg once weekly, adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given once weekly or once every 2 weeks
- Symptomatic anaemia associated with chronic renal failure in patients not on dialysis (see also MHRA/CHM advice, p. 582), ADULT and CHILD over 11 years, by subcutaneous or intravenous injection, initially 450 nanograms/kg once weekly or by subcutaneous injection, initially 750 nanograms/kg once every 2 weeks; adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given subcutaneously or intravenously once weekly or subcutaneously once every 2 weeks or subcutaneously once every month

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. When changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements. Adjust doses not more frequently than every 2 weeks during maintenance treatment.

- Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 582), by subcutaneous injection, initially 6.75 micrograms/kg once every 3 weeks or 2.25 micrograms/kg once weekly (if response inadequate after 9 weeks further treatment may not be effective); if adequate response obtained, reduce dose by 25–50%

Note Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

Aranesp® (Amgen) (Recombinant human erythropoietins)

Injection, prefilled syringe, darbepoetin alfa, 25 micrograms/mL, net price 0.4 mL (10 micrograms) = £14.68; 40 micrograms/mL, 0.375 mL (15 micrograms) = £22.03, 0.5 mL (20 micrograms) = £29.37; 100 micrograms/mL, 0.3 mL (30 micrograms) = £44.05, 0.4 mL (40 micrograms) = £58.73, 0.5 mL (50 micrograms) = £73.41; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81, 0.65 mL (130 micrograms) = £190.66; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

Injection (Aranesp® SureClick), prefilled disposable injection device, darbepoetin alfa, 40 micrograms/mL, net price 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, 0.4 mL (40 micrograms) = £58.72; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

EPOETIN ALFA, BETA, THETA, and ZETA

(Recombinant human erythropoietins)

Note The prescriber must specify which epoetin is required, see also Biosimilar medicines, p. 1

Indications see under preparations, below
Cautions see notes above; also inadequately treated or poorly controlled blood pressure (monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes), interrupt treatment if blood pressure uncontrolled; sudden stabbing migraine-like pain is warning of a hypertensive crisis; sickle-cell disease (lower target haemoglobin concentration may be appropriate); ischaemic vascular disease; thrombocytosis (monitor platelet count for first 8 weeks); epilepsy; malignant disease; increase in unfractionated or low molecular weight heparin dose may be needed during dialysis; risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy; risk of thrombosis may be increased...
when used for anaemia before orthopaedic surgery— 
avoid in cardiovascular disease including recent 
myocardial infarction or cerebrovascular accident

Contra-indications pure red cell aplasia following 
erythropoietin therapy (see also notes above); 
uncontrolled hypertension; patients unable to receive 
thromboprophylaxis; avoid injections containing 
benzyl alcohol in neonates (see under preparations, below)

Hepatic impairment manufacturers advise caution in 
chronic hepatic failure

Pregnancy no evidence of harm; benefits probably 
outweigh risk of anaemia and of transfusion in 
pregnancy

Breast-feeding unlikely to be present in milk; minimal 
effect on infant

Side-effects diarrhoea, nausea, vomiting; dose- 
dependent increase in blood pressure or aggravation 
of hypertension; in isolated patients with normal or 
low blood pressure, hypertensive crisis with 
cephalopathy-like symptoms and generalised tonic- 
clonic seizures requiring immediate medical attention;

headache; dose-dependent increase in platelet count 
(but thrombocytopenia rare) regressing during treat- 
ment; influenza-like symptoms (may be reduced if 
intrafuse injection given over 5 minutes); cardio- 
vascular events; shunt thrombosis especially if ten- 
dency to hypotension or arteriovenous shunt com- 
plications; very rarely sudden loss of efficacy because of 
pure red cell aplasia, particularly following subcu- 
taneous administration in patients with chronic renal failure 
(discontinue erythropoietin therapy)—see also notes above, hyperkalaemia, hypertension; in isolated patients with 
haemoglobin concentration decreases and then restart at a dose 
continues to rise, despite dose reduction, suspend treatment until 
haemoglobin concentration decreases and then restart at a dose 
approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy 
(see also MHRA/CHM advice, p. 582), by subcutaneous injection 
(max. 1 mL per injection site), initially 150 units/kg 3 times weekly 
(or 450 units/kg once weekly), increased if appropriate rise in 
haemoglobin (or reticulocyte count) not achieved after 4 weeks to 
300 units/kg 3 times weekly; discontinue if inadequate response 
after 4 weeks at higher dose.

Reduce dose by approximately 25–50% if rise in haemoglobin 
concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin 
concentration increases 12 g/100 mL, if haemoglobin concentration 
continues to rise, despite dose reduction, suspend treatment until 
haemoglobin concentration decreases and then restart at a dose 
approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving major surgery, 
by intravenous injection over 1–5 minutes, 600 units/kg twice weekly for 3 weeks before surgery; consult product literature for details and advice on 
ensuring high iron stores

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) 
before elective orthopaedic surgery in adults with expected 
moderate blood loss to reduce exposure to allogeneic blood 
transfusion or if autologous transfusion unavailable, by subcuta- 
neous injection (max. 1 mL per injection site), 600 units/kg every 
week for 3 weeks before surgery and on day of surgery or 
300 units/kg daily for 15 days before starting 10 days before surgery; 
consult product literature for details

Eperep (Janssen-Cilag) 
Injection, prefilled syringe, epoetin alfa, net price 
1000 units = £5.53; 2000 units = £11.07; 3000 units = 
£16.60; 4000 units = £22.13; 5000 units = £27.66; 
6000 units = £33.19; 8000 units = £44.25; 10 000 units = 
£55.31; 20 000 units = £110.62; 30 000 units = 
£199.11; 40 000 units = £265.48. An auto-injector 
device is available for use with prefilled syringes

Dose symptomatic anaemia associated with chronic renal failure in 
patients on haemodialysis (see also MHRA/CHM advice, p. 582), by intravenous injection over 1–5 minutes 
or by subcutaneous injection (max. 1 mL per injection site), initially 50 units/ 
kg 3 times weekly adjusted according to response in steps of 
25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually a total of 75–300 units/kg weekly (as a 
single dose or in divided doses). CHILD by intravenous injection 
initially as for adults; maintenance dose, body-weight under 10 kg 
usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg 
usually 60–150 units/kg 3 times weekly, body-weight over 30 kg 
usually 30–100 units/kg 3 times weekly

Symptomatic anaemia associated with chronic renal failure in 
adults on peritoneal dialysis (see also MHRA/CHM advice, p. 582), by intravenous injection over 1–5 minutes or by subcu- 
taneous injection (max. 1 mL, per injection site), initially 50 units/ 
kg twice weekly; maintenance dose 25–50 units/kg twice weekly

Severe symptomatic anaemia of renal origin in adults with renal 
insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 582), by intravenous injection over 1–5 minutes or by subcu- 
taneous injection (max. 1 mL, per injection site), initially 50 units/ 
kg 3 times weekly increased according to response in steps of 
25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 17–33 units/kg 3 times weekly; max. 
200 units/kg 3 times weekly

Note Intravenous route preferred; reduce dose by approximately 
25% if rise in haemoglobin concentration exceeds 2 g/100 mL, over 4 weeks or if haemoglobin concentration increases 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduc- 
tion, suspend treatment until haemoglobin concentration decreases and 
then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy 
(see also MHRA/CHM advice, p. 582), by subcutaneous injection 
(max. 1 mL, per injection site), initially 150 units/kg 3 times weekly 
(or 450 units/kg once weekly), increased if appropriate rise in 
haemoglobin (or reticulocyte count) not achieved after 4 weeks to 
300 units/kg 3 times weekly; discontinue if inadequate response 
after 4 weeks at higher dose.

Note Reduce dose by approximately 25–50% if rise in haemoglobin 
concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentratio
mg/dL after 4 weeks, increased according to response at intervals of 4 weeks in steps of 25% of the previous dose; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 12 weeks; total weekly maintenance dose may be given as a single dose or in 3–7 divided doses; maximum 7200 units/kg weekly.

Note Discontinue route of administration should be used

Dosage

- **Subcutaneous route** preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/dL. Maintenance dose, increased according to response at intervals of 4 weeks in steps of 25% of the previous dose; maximum 7200 units/kg weekly.

- **Note Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/dL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/dL in 4 weeks, increased according to response at intervals of 4 weeks in steps of 25% of the previous dose; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3–7 divided doses; maximum 7200 units/kg weekly.

Note
Avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 582), by subcutaneous injection, initially 20,000 units once weekly, increased if necessary after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved) to 40,000 units once weekly, with further increase if needed after 4 weeks to max. 60,000 units once weekly
Note
Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 12 weeks of therapy (response unlikely). Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

Epoetin zeta
Retacrit® (Hospira) ▼ (Full)
Injection, prefilled syringe, epoetin zeta, net price 1000 units = £5.66; 2000 units = £11.31; 3000 units = £16.97; 4000 units = £22.63; 5000 units = £28.28; 6000 units = £33.94; 8000 units = £45.25; 10,000 units = £56.57; 20,000 units = £103.64; 30,000 units = £150.74; 40,000 units = £179.47
Excipients include phenylalanine up to 500 micrograms/syringe (section 4.1.4)
Note
Biological medicine, p. 1
Dose
Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 582), by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg or 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly. CHILD by intravenous injection initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 30–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–180 units/kg 3 times weekly. Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 582), by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 2 times weekly; maintenance dose 25–50 units/kg 2 times weekly. Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 582), by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly; max. 200 units/kg 3 times weekly
Note
Avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks
Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 582), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly, discontinue if inadequate response after 4 weeks at higher dose
Note
Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
Discontinue approximately 4 weeks after ending chemotherapy
To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly, discontinue if inadequate response after 4 weeks at higher dose
Sickle-cell disease
Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation,
intravenous fluids, analgesia (section 4.7), and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine (section 14.4), haemophilus influenzae type b vaccine (section 14.4), an annual influenza vaccine (section 14.4) and prophylactic penicillin (Table 2, section 5.1) reduce the risk of infection. Hepatitis B vaccine (section 14.4) should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary (section 9.1.2).

**Hydroxyurea** can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease; it should be considered in consultation with a specialist centre. The beneficial effects of hydroxyurea may not become evident for several months. Myelosuppression and skin reactions are the most common side-effects.

### Hydroxyurea (Hydroxycarbamide)

**Indications** sickle-cell disease (see notes above); chronic myeloid leukaemia, cancer of the cervix (section 8.1.5).

**Cautions** see section 8.1 and notes above; also monitor renal and hepatic function before and during treatment; monitor full blood count before treatment, then every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on max. dose); leg ulcers (review treatment if cutaneous vasculitic ulcerations develop); **interactions:** Appendices 1 (hydroxyurea).

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**Renal impairment** reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

**Pregnancy** section 8.1.5

**Breast-feeding** section 8.1.5

**Side-effects** see section 8.1 and notes above; also headache, less commonly dizziness and rash; rarely reduced sperm count and activity; fever, ameorohea, skin cancers (in elderly patients); bleeding and hypomagnesaemia also reported.

**Dose**
- By mouth, initially 15 mg/kg daily, increased every 12 weeks in steps of 5 mg/kg daily according to response; usual dose 15–30 mg/kg daily (max. 35 mg/kg daily); **CHILD** under 18 years, see BNf for Children

**Siklos** (Nordic) Tablets, scored, f/c, hydroxyurea 1 g, net price 30-tab pack = £500.00

**Iron overload**

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis. Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound [desferrioxamine mesilate](#) is useful. Subcutaneous infusions of desferrioxamine are given over 8–12 hours, 3–7 times a week. The dose should reflect the degree of iron overload. For children starting therapy (and who have low iron overload) the dose should not exceed 30 mg/kg. For established overload the dose is usually between 20 and 50 mg/kg daily. Desferrioxamine (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine is not added to the blood and is not given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine is enhanced by administration of ascorbic acid (vitamin C, section 9.6.3) 200 mg daily by mouth (100 mg in infants); it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

Desferrioxamine infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

**Deferasirox**, an oral iron chelator, is licensed for the treatment of chronic iron overload in adults and children over 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells). It is also licensed for chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells), in patients with other anaemias, and in children aged 2 to 5 years.

The Scottish Medicines Consortium (p. 4) has advised that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

**Deferiprone**, an oral iron chelator, is licensed for the treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate. Blood dyscrasias, particularly agranulocytosis, have been reported with deferiprone.
interruption if unexplained cytopenia occurs; not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes); history of liver cirrhosis; test liver function before treatment, then every 2 weeks during the first month, and then monthly; measure baseline serum creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter; test for proteinuria monthly; interactions: Appendix 1 (deferisirox)

**Hepatic impairment** manufacturer advises caution—no information available; avoid in severe impairment

**Renal impairment** reduce dose by 10 mg/kg if eGFR 60–90 mL/minute/1.73 m² and if serum creatinine increased by more than 35% of baseline measurement on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction; avoid if eGFR less than 60 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** gastro-intestinal disturbances (including ulceration and fatal haemorrhage); headache; proteinuria; pruritus, rash; less commonly hepatitis, cholelithiasis, oedema, fatigue, anxiety, sleep disorder, dizziness, pyrexia, pharyngitis, glucosuria, renal tubulopathy, disturbances of hearing and vision (including lens opacity and maculopathy), and skin pigmentation; hepatic failure, acute renal failure, blood disorders (including agranulocytosis, neutropenia, pancytopenia, and thrombocytopenia); hyper-sensitivity reactions (including anaphylaxis and angioedema), alopecia also reported

**Dose**

- **ADULT** and **CHILD** over 6 years initially 10–30 mg/kg once daily according to serum-ferritin concentration and amount of transfused blood (consult product literature); maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration; usual max. 30 mg/kg daily, but may be increased to max. 40 mg/kg daily and reduced in steps of 5–10 mg/kg once control achieved

**Exjade** (Novartis) ▼ (SW)

**Dispensable tablets**, deferasirox 125 mg, net price 28-tab pack = £117.60; 250 mg, 28-tab pack = £235.20; 500 mg, 28-tab pack = £470.40. Label: 13, 22, counselling, administration

**Counselling** Tablets should be dispersed in water, orange juice, or apple juice, if necessary, resuspend residue

**DEFERIPRONE**

**Indications** see notes above

**Cautions** monitor neutrophil count weekly and discontinue treatment if neutrophenia develops; monitor plasma-zinc concentration

**Blood disorders** Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop

**Contra-indications** history of agranulocytosis or recurrent neutropenia

**Hepatic impairment** manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises avoid before intended conception and during pregnancy—teratogenic and embryotoxic in animal studies; contraception advised in women of child-bearing potential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance), increased appetite; headache; red-brown urine discoloration; neutropenia, agranulocytosis; zinc deficiency; arthropathy

**Dose**

- **ADULT** and **CHILD** over 6 years 25 mg/kg 3 times daily (max. 100 mg/kg daily)

**Ferriprox** (Swedish Orphan) ▼ (SW)

**Tablets**, f/c, scored, deferiprone 500 mg, net price 100-tab pack = £152.39. Label: 14, counselling, blood disorders

**Oral solution**, red, deferiprone 100 mg/mL, net price 500 mL = £152.39. Label: 14, counselling, blood disorders

**DESFERRIOXAMINE MESILATE**

(Deferoxamine Mesilate)

**Indications** see notes above; iron poisoning, see Emergency Treatment of Poisoning, p. 38

**Cautions** eye and ear examinations before treatment and at 3-month intervals during treatment; monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses; aluminium-related encephalopathy (may exacerbate neurological dysfunction); interactions: Appendix 1 (deferoxamine)

**Renal impairment** use with caution

**Pregnancy** teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** nausea, vomiting, abdominal pain; headache; pyrexia; growth retardation and bone disorders (see Cautions); arthralgia, myalgia; hearing disturbances; injection-site reactions; rarely diarrhoea, hepatic impairment, hypotension (especially when given too rapidly by intravenous injection), anaphylaxis, Yersinia and mucormycosis infections, blood dyscrasias (including thrombocytopenia and leucopenia), leg cramps, bone pain, visual disturbances (including lens opacity and retinopathy), rash; very rarely acute respiratory distress, neurological disturbances (including dizziness, neuropathy, convulsions, and paraesthesia), renal impairment; muscle spasms also reported

**Dose**

- **See notes above**; iron poisoning, see Emergency Treatment of Poisoning, p. 38

**Note** For full details and warnings relating to administration, consult product literature

**Desferrioxamine mesilate** (Non-proprietary) ▼ (SW)

**Injection**, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.26; 2-g vial = £17.05

**DEFERIPRONE**

**Indications** see notes above

**Cautions** monitor neutrophil count weekly and discontinue treatment if neutrophenia develops; monitor plasma-zinc concentration

**Blood disorders** Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop

**Contra-indications** history of agranulocytosis or recurrent neutropenia

**Hepatic impairment** manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase

Paroxysmal nocturnal haemoglobinuria

Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis. It is used to reduce haemolysis in paroxysmal nocturnal haemoglobinuria, a severe and disabling form of haemolytic anaemia.

Eculizumab

**Indications** paroxysmal nocturnal haemoglobinuria, in those with a history of blood transfusions (specialist use only)

**Cautions** active systemic infection; monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) for at least 8 weeks after discontinuation

**Meningococcal infection** Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date (section 14.1)

**Contra-indications** unresolved *Neisseria meningitidis* infection; patients unvaccinated against *Neisseria meningitidis* (see Cautions above); known or suspected hereditary complement deficiencies

**Pregnancy** no information available—use only if potential benefit outweighs risk; human IgG antibodies known to cross placenta; manufacturer advises effective contraception during and for 5 months after treatment

**Breast-feeding** no information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment

**Side-effects** gastro-intestinal disturbances; oedema; cough, nasopharyngitis; headache, dizziness, fatigue, dysgeusia, paraesthesia; infection (including meningococcal infection); spontaneous erection, dysuria, arthralgia, myalgia; blood disorders (including thrombocytopenia); alopecia, pruritus, rash; influenza-like symptoms; infusion-related reactions; less commonly anorexia, gingival pain, jaundice, palpitation, haematoma, hypotension, chest pain, syncope, hot flushing, epistaxis, anxiety, depression, mood changes, sleep disturbances, Graves’ disease, menstrual disorders, renal impairment, malignant melanoma, muscle spasms, myelodysplastic syndrome, visual disturbances, tinnitus, hyperhidrosis, petechiae, and skin depigmentation

**Dose**

- By intravenous infusion, **ADULT** over 18 years, initially 600 mg once a week for 4 weeks, then 900 mg on week 5; maintenance, 900 mg once every 12–16 days

**Soliris** (Alexion) (Novartis) 

**Injection**, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.67, 2-g vial = £18.66

**ECULIZUMAB**

**Electrolytes** Na+ 5 mmol/vial

**Concentrate for intravenous infusion**, eculizumab 10 mg/mL, net price 30-mL vial = £3150.00. Counselling, meningococcal infection, patient information card

**Early warning signs** pyrexia, hypotension, rash, dyspnoea, and confusion

**Adverse reactions**

Adverse reactions can be severe and include:

- Gastro-intestinal disturbances: nausea, vomiting, abdominal pain, anorexia, constipation, diarrhoea

- Cardio-vascular disturbances: peripheral oedema, dyspnoea, tachycardia, hypotension

- Haematological disturbances: anaemia, leucopenia, thrombocytopenia

- Neurological disturbances: headache, seizures, convulsions, psychiatric disturbances

- Renal disturbances: proteinuria, haematuria, pyuria, dysuria

- Urogenital disturbances: dysuria, pyuria, and oliguria

- Endocrine disturbances: diabetes mellitus, hyperglycaemia

- Haemorrhage

**Precautions** acute, severe haemorrhage associated with severe anaemia or thrombocytopenia is an absolute contraindication to therapy. Consideration should be given to the use of corticosteroids or other immunosuppressants in cases of severe anaemia, e.g. prednisolone 1 mg/kg daily, gradually reducing the dose over several weeks. Plasmapheresis is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

**Idiopathic thrombocytopenic purpura**

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a corticosteroid, e.g. prednisolone 1 mg/kg daily, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

**Immunoglobulin** preparations (section 14.5.1), are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid.

**Anti-D (Rh0) immunoglobulin** (section 14.5.3) is effective in raising the platelet count in about 80% of unsplenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine (section 8.2.1), cyclophosphamide (section 8.1.1), vincristine (section 8.1.4), ciclosporin (section 8.2.2), and danazol (section 6.7.2). Rituximab (section 8.2.3) may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid (section 2.11) may be given to reduce the severity of haemorrhage.

**Eltrombopag** and romiplostim are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance below). Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

The **Scottish Medicines Consortium** (p. 4) has advised (July 2010) that **eltrombopag (Revolade®)** is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.

**NICE guidance**

Eltrombopag for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (October 2010)

Eltrombopag is not recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in splenectomised adults refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised adults when surgery is contra-indicated.

The **Scottish Medicines Consortium** (p. 4) has advised (September 2009) that romiplostim (Nplate®) is
accepted for restricted use within NHS Scotland for patients with severe symptomatic idiopathic thrombocytopoietic purpura or those at high risk of bleeding.

**ELTROMBOPEG**

**Indications** see notes above

**Cautions** patients of East Asian origin (see under Dose); risk factors for thromboembolism; monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50 \times 10^9/litre or more for at least 4 weeks), then monthly thereafter; monitor liver function before and during treatment, every two weeks when adjusting the dose, and monthly thereafter; regular ophthalmological examinations for cataract formation recommended; **interactions:** Appendix 1 (eltrombopag)

**Hepatic impairment** use with caution; avoid in moderate to severe impairment unless potential benefit outweighs risk; reduce initial dose to 25 mg once daily

**Renal impairment** use with caution

**Pregnancy** avoid—toxicity in animal studies; ensure effective contraception during treatment

**Breast-feeding** manufacturer advises avoid

**Side-effects** gastro-intestinal disturbances including nausea, diarrhoea, abdominal pain, and constipation; peripheral oedema; headache, insomnia, paraesthesia, fatigue; arthralgia, bone pain, myalgia; cataract, dry eye; pruritus, rash, alopecia; less commonly dry mouth, gingival bleeding, haemorrhoids, taste disturbances, cholestasis, hepatitis, anorexia, changes in appetite, weight gain, flushing, palpitation, QT-interval prolongation, hypertension, tachycardia, thromboembolic events (including deep vein thrombosis, pulmonary embolism, and acute myocardial infarction); cough, sleep disorders, mood changes, depression, anxiety, dizziness, migraine, hemiparesis, tremor, peripheral neuropathy, respiratory and urinary tract infections, renal failure, nocturia, rectosigmoid cancer, blood disorders (including anaemia, and thrombocytopenia), gout, eye disorders, vertigo, epistaxis, skin reactions including ecchymosis, and sweating

**Dose**

- **ADULT** over 18 years, initially 50 mg once daily (patients of EAST ASIAN origin such as Chinese, Japanese, Taiwanese, or Korean, initially 25 mg once daily), adjusted to achieve a platelet count of 50 \times 10^9/litre or more (consult product literature for dose adjustments); max. 75 mg once daily; discontinue if inadequate response after 4 weeks at maximum dose

**Counselling** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption

**Revolade** (GSK) Tablets, f/c. eltrombopag (as olamine) 25 mg (white), net price 28-tab pack = £770.00; 50 mg (brown), 28-tab pack = £1540.00. Counselling, see above

**ANAGRELIDE**

**Indications** see notes above

**Cautions** cardiovascular disease—assess cardiac function before and during treatment; concomitant aspirin in patients at risk of haemorrhage; monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established), liver function, serum creatinine and urea; **interactions:** Appendix 1 (anagrelide)

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises use only if essential—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances; flushing, oedema; dizziness, migraine, insomnia, fatigue, asthenia, paraesthesia; influenza-like symptoms; arthralgia, myalgia, bone pain, muscle spasm; increased bone marrow reticulin; ecchymosis, rash; injection-site reactions

**Dose**

- By subcutaneous injection. **ADULT** over 18 years, initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg at weekly intervals until a stable platelet count of 50 \times 10^9/litre or more is reached (consult product literature for dose adjustments); max. 10 micrograms/kg once weekly; discontinue if inadequate response after 4 weeks at maximum dose

**Nplate** (Amgen) \( \downarrow \) Injection, powder for reconstitution, romiplostim, net price 250-microgram vial (available with or without solvent) = £462.00

---

**ROMIPLOSTIM**

**Indications** see notes above

**Cautions** monitor full blood count and peripheral blood smears for morphological abnormalities before and during treatment; monitor platelet count weekly until 50 \times 10^9/litre or more for at least 4 weeks without dose adjustment, then monthly thereafter

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises avoid (toxicity in animal studies)

**Breast-feeding** manufacturer advises avoid—no information available
Side-effects  gastro-intestinal disturbances; palpitation, tachycardia, fluid retention; headache, dizziness, fatigue; anaemia; rash; *less commonly* pancreatitis, gastro-intestinal haemorrhage, congestive heart failure, hypertension, arrhythmias, syncope, chest pain, dyspnoea, sleep disturbances, paraesthesia, hypoaesthesia, should be considered, confusion, amnesia, fever, weight changes, impotence, blood disorders, myalgia, arthralgia, epistaxis, dry mouth, alopecia, skin discoloration, and pruritus; *rarely* gastroenteritis, colitis, postural hypotension, angina, myocardial infarction, vasodilatation, pulmonary hypotension, pulmonary infiltrates, migraine, drowsiness, impaired coordination, dysarthria, asthma, tinnitus, renal failure, nocturia, visual disturbances, and gingival bleeding; allergic alveolitis and hepatitis also reported

Dose

- Initially 500 micrograms twice daily adjusted according to response in steps of 500 micrograms at weekly intervals to max. 10 mg daily (max. single dose 2.5 mg); usual dose range 1–3 mg daily in divided doses

Xagrid® (Shire) ▼ [TA]
Capsules, anagrelide (as hydrochloride), 500 micrograms, net price 100-cap pack = £337.14. Counselling, driving, see above

9.1.5 G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they eat fava beans (*Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6FD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6FD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6FD deficiency is common.

A very few G6FD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

### Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methyleneblue (higher doses for dermatitis herpetiformis more likely to cause problems)

### Drugs with possible risk of haemolysis in some G6PD-deficient individuals

- Quinine (acceptable in acute malaria and malarias not currently on the market)
- Chloroquine (acceptable in acute malaria)
- Hydroxychloroquine (acceptable in acute malaria)
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people, see section 5.4.1)
- Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6FD-deficient individuals)

Note: Methyleneblue in mothballs also causes haemolysis in individuals with G6PD deficiency

### Drugs used in neutropenia

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim (unglycosylated rhG-CSF) and lenograstim (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy. Pegfilgrastim is a polyethylene glycol-conjugated (‘pegylated’) derivative of filgrastim; pegylation increases the duration of filgrastim activity. Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.
Cautions  Granulocyte-colony stimulating factors should be used with caution in patients with pre-malignant or malignant myeloid conditions. Full blood counts including differential white cell and platelet counts should be monitored. Treatment should be withdrawn in patients who develop signs of pulmonary infiltration. There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a history of pulmonary infiltrates or pneumonia may be at higher risk. Granulocyte-colony stimulating factors should be used with caution in patients with sickle-cell disease. Spleen size should be monitored during treatment because there is a risk of splenomegaly and rupture.

Pregnancy  There have been reports of toxicity in animal studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

Breast-feeding  There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

Side-effects  Side-effects of granulocyte-colony stimulating factors include gastro-intestinal disturbances, anorexia, headache, asthenia, fever, musculoskeletal pain, bone pain, rash, alopecia, injection-site reactions, thrombocytopenia, and leucocytosis. Less commonly, chest pain can occur. Pulmonary side-effects, particularly interstitial pneumonia (see Cautions above), cutaneous vasculitis and acute febrile neutrophilic dermatosis have rarely been reported.

Dose  
- Cytotoxic-induced neutropenia, preferably by subcutaneous injection or by intravenous infusion over 30 minutes, ADULT and CHILD, 500 000 units/kg daily started at least 24 hours after cytotoxic chemotherapy, continued until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia)
- Myeloablative therapy followed by bone-marrow transplantation, by intravenous infusion over 24 hours, or by subcutaneous infusion over 24 hours, 1 million units/kg daily, started at least 24 hours following cytotoxic chemotherapy (and within 24 hours of bone-marrow infusion), then adjusted according to neutrophil count (consult product literature)
- Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone, by subcutaneous injection or by subcutaneous infusion over 24 hours, 1 million units/kg daily for 5–7 days; used following adjunctive myelosuppressive chemotherapy (to improve yield), by subcutaneous injection, 500 000 units/kg daily, started the day after completing chemotherapy and continued until neutrophil count in normal range; for timing of leucopheresis consult product literature
- Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion, by subcutaneous injection, ADULT under 60 years and CHILD over 16 years, 1 million units/kg daily for 4–5 days; for timing of leucopheresis consult product literature
- Severe chronic neutropenia, by subcutaneous injection, ADULT and CHILD, in severe congenital neutropenia, initially 1.2 million units/kg daily in single or divided doses (initially 500 000 units/kg daily in idiopathic or cyclic neutropenia), adjusted according to response (consult product literature)
- Persistent neutropenia in HIV infection, by subcutaneous injection, initially 500 000 units/kg daily, increased as necessary until neutrophil count in normal range (usual max. 400 000 units/kg daily), then adjusted to maintain neutrophil count in normal range (consult product literature)

FILGRASTIM  (Recombinant human granulocyte-colony stimulating factor, G-CSF)

Indications  (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes); reduction in duration of neutropenia (and associated sequelae) in myeloblastic therapy followed by bone-marrow transplantation; mobilisation of peripheral blood progenitor cells for harvesting and subsequent autologous or allogeneic infusion; severe congenital neutropenia, cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders, consult product literature); persistent neutropenia in advanced HIV infection

Cautions  see notes above; also regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia); secondary acute myeloid leukaemia; osteoporotic bone disease (monitor bone density if given for more than 6 months); Interactions: Appendix 1 (filgrastim)

Contra-indications  severe congenital neutropenia (Kostmann’s syndrome) with abnormal cytogenetics

Pregnancy  see notes above

Breast-feeding  see notes above

Side-effects  see notes above; also mucositis, splenic enlargement, hepatomegaly, transient hypotension, epistaxis, urinary abnormalities (including dysuria, proteinuria, and haematuria), osteoporosis, exacerbation of rheumatoid arthritis, anaemia, transient decrease in blood glucose, pseudogout, and raised uric acid; very rarely splenic rupture

Appendix 1 (filgrastim)
LENOGRASTIM
(Recombinant human granulocyte-colony stimulating factor, HuG-CSF)

**Indications** (specialist use only) reduction in the duration of neutropenia and associated complications following peripheral stem cells or bone-marrow transplantation for non-myeloid malignancy, or following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia; mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also very rarely splenic rupture

**Dose**

- Following bone-marrow transplantation, by intravenous infusion or subcutaneous injection, ADULT and CHILD over 2 years 19.2 million units/m² daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days)

- Following peripheral stem cells transplantation, by intravenous infusion or subcutaneous injection, ADULT 19.2 million units/m² daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days); CHILD see BNF for Children

- Cytotoxic-induced neutropenia, by subcutaneous injection, ADULT 19.2 million units/m² daily started the day after completion of chemotherapy, continued until neutrophil count stable in acceptable range (max. 28 days); CHILD see BNF for Children

- Mobilisation of peripheral blood progenitor cells, used alone, by subcutaneous injection, ADULT 1.28 million units/kg daily for 4–6 days (5–6 days in healthy donors); used following adjunctive myelosuppressive chemotherapy (to improve yield), by subcutaneous injection, 19.2 million units/m² daily, started 1–5 days after completion of chemotherapy and continued until neutrophil count in acceptable range; for timing of leucapheresis consult product literature; CHILD see BNF for Children

**Granocyte®** (Chugai) (BNF 61 9.1.7 Drugs used to mobilise stem cells)

**Injection**, powder for reconstitution, leugranostim, net price 13.4 million-unit (105-microgram) vial = £40.11; 33.6 million-unit (263-microgram) vial = £62.54 (both with 1-mL prefilled syringe water for injections)

**Ratiograstim®** (Ratiopharm UK) (BNF 61 9.1.7 Drugs used to mobilise stem cells)

**Injection**, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £62.26; 48 million-units (480 micrograms)/0.8 mL = £99.29

**Note** Biosimilar medicine, p. 1

**Tevaragristim®** (TEVA UK) (BNF 61 9.1.7 Drugs used to mobilise stem cells)

**Injection**, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £59.00; 48 million-units (480 micrograms)/0.5 mL = £94.00

**Note** Biosimilar medicine, p. 1

**Zarzio®** (Sandoz) (BNF 61 9.1.7 Drugs used to mobilise stem cells)

**Injection**, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £59.00; 48 million-units (480 micrograms)/0.5 mL = £94.00

**Note** Biosimilar medicine, p. 1

**PEGFILGRASTIM**
(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

**Indications** (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

**Cautions** see notes above; also acute leukaemia and myelosuppressive chemotherapy; **interactions:** Appendix 1 (filgrastim)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also acute leukaemia and myelosuppressive chemotherapy

**Dose**

- By subcutaneous injection, ADULT over 18 years, 6 mg (0.6 mL) for each chemotherapy cycle, starting 24 hours after chemotherapy

**Neulasta®** (Amgen) (BNF 61 9.1.7 Drugs used to mobilise stem cells)

**Injection**, pegfilgrastim (expressed as filgrastim) 10 mg/mL, net price 0.6-mL (6-mg) prefilled syringe = £686.38

**9.1.7 Drugs used to mobilise stem cells**

Plerixafor is a chemokine receptor antagonist licensed to mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma. Plerixafor should be given under specialist supervision following 4 days treatment with a granulocyte-colony stimulating factor (section 9.1.6)

**PLERIXAFOR**

**Indications** see notes above

**Cautions** monitor platelet and white blood cell count

**Renal impairment** reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute; no information available if creatinine clearance less than 20 mL/minute

**Pregnancy** manufacturer advises avoid unless essential and use effective contraception during treatment—teratogenic in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances, dry mouth, oral hypoesthesia; dizziness, headache, insomnia, fatigue; arthralgia, musculoskeletal pain; erythema, sweating; injection-site reactions; less commonly hypersensitivity reactions including dyspnoea and periorbital swelling

**Dose**

- By subcutaneous injection, ADULT over 18 years, 240 micrograms/kg daily 6–11 hours before initiation of apheresis; usual duration 2–4 days (max. 7 days)

**Mozobil®** (Genzyme) (BNF 61 9.1.7 Drugs used to mobilise stem cells)

**Injection**, plerixafor 20 mg/mL, net price 1.2 mL-vial = £4882.77

**Electrolytes Na+ < 0.5 mmol/mL**
in this section. Oral preparations for removing excess potassium and preparations for oral rehydration therapy are also included here. Oral bicarbonate, for metabolic acidosis, is also described in this section. For reference to calcium, magnesium, and phosphate, see section 9.5.

**Compensation for potassium loss** is especially necessary:
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see below for warning on renal insufficiency). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are *seldom required* with the small doses of diuretics given to treat hypertension; *potassium-sparing diuretics* (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide or the thiazides when these are given to eliminate oedema.

**Dosage** If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride 2 to 4 g (approx. 25 to 50 mmol) daily (in divided doses) by mouth are suitable in patients taking a normal diet. *Smaller doses must be used if there is renal insufficiency* (common in the elderly) to reduce the risk of hyperkalaemia. Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable (see also above). Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements. When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

**Administration** Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hyperchloraemic states, section 9.2.1.3). Silt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt® and Ruthmol®). These should not be used by patients with renal failure as potassium intoxication may result.
Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/L or in the presence of ECG changes) calls for urgent treatment with 10–20 mL of calcium gluconate 10% by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% given over 5–15 minutes, reduces serum-potassium concentration; it is repeated if necessary or a continuous infusion instituted. Salbutamol [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate infusion (section 9.2.2) should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Management of hyperkalaemia

Ion-exchange resins may be used to remove excess potassium in mild hyperkalaemia or in moderate hyperkalaemia when there are no ECG changes.

POTASSIUM CHLORIDE

**Indications** potassium depletion (see notes above)

**Cautions** see notes above; cardiac disease; elderly; with modified-release preparations, intestinal stricture, history of peptic ulcer, hiatus hernia; interactions: Appendix 1 (potassium salts)

**Contra-indications** plasma-potassium concentration above 5 mmol/litre

**Renal impairment** close monitoring required—risk of hyperkalaemia; avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, flatulence; with modified-release preparations, gastrointestinal obstruction, ulceration and bleeding also reported

**Dose**

- See notes above

**Note** Do not confuse Effervescent Potassium Tablets BPC 1968 (section 9.2.1) with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states (section 9.2.1.3).

**Kay-Cee-L** (Geistlich)

**Syrup**, sugar-free, red, potassium chloride 7.5% (1 mmol/mL each of K⁺ and Cl⁻), net price 500 mL = £4.07. Label: 21

**Sando-K** (HK Pharma)

**Tablets**, effervescent, potassium bicarbonate and chloride equivalent to potassium 470 mg (12 mmol of K⁺) and chloride 285 mg (8 mmol of Cl⁻). Net price 20 = £1.53. Label: 13, 21

**Modified-release preparations**

Avoid unless effervescent tablets or liquid preparations inappropriate

**Slow-K** (Alliance)

**Tablets**, m/t, orange, s/c, potassium chloride 600 mg (8 mmol each of K⁺ and Cl⁻), net price 100 = £2.14. Label: 25, 27, counselling, swallow whole with fluid during meals while sitting or standing

**POLYSTYRENE SULPHONATE RESINS**

**Indications** hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

**Cautions** children (impaction of resin with excessive dosage or inadequate dilution); monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre); sodium-containing resin in congestive heart failure, hypertension, and oedema; interactions: Appendix 1 (polystyrene sulphonate resins)

**Contra-indications** obstructive bowel disease; neoplasms with reduced gut motility; calcium-containing resin in hyperparathyroidism, multiple myeloma, sarcoidosis, or metastatic carcinoma

**Renal impairment** use sodium-containing resin with caution

**Pregnancy** manufacturers advise use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturers advise use only if potential benefit outweighs risk—no information available

**Side-effects** faecal impaction following rectal administration, gastro-intestinal concretions following oral administration, intestinal necrosis reported with concomitant use of sorbitol, gastric irritation, anorexia, nausea, vomiting, constipation (discontinue treatment—avoid magnesium-containing laxatives), diarrhoea, hypomagnesaemia; gastro-intestinal obstruction, ulceration, necrosis, and ischaemic colitis also reported; with calcium-containing resin, hyperkalaemia (including in dialysed patients and occasionally in those with renal impairment); with sodium-containing resin, sodium retention, hypocaulaemia

**Dose**

- **By mouth**, 15 g 3–4 times daily in water (not fruit squash which has a high potassium content) or as a paste; **CHILD** 0.5–1 g/kg daily in divided doses

- **By rectum**, as an enema, 30 g in methylcellulose solution, retained for 9 hours followed by irrigation to remove resin from colon; **NEONATE** and **CHILD**, 0.5–1 g/kg daily

**Calcium Resonium®** (Sanofi-Aventis)

**Powder**, buff, calcium polystyrene sulphonate. Net price 300 g = £68.47. Label: 13

**Resonium A** (Sanofi-Aventis)

**Powder**, buff, sodium polystyrene sulphonate. Net price 454 g = £67.50. Label: 13

**9.2.1.2 Oral sodium and water**

Sodium chloride is indicated in states of sodium depletion and usually needs to be given intravenously (section 9.2.2). In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate (section 9.2.1.3), according to the acid-base status of the patient, may be sufficient.
SODIUM CHLORIDE

Indications  sodium depletion—see also 9.2.2.1; nebuliser diluent (section 3.1.5); eye (section 11.8.1); oral hygiene (section 13.11.1)

Slow Sodium® (HK Pharma)
Tablets, m/tablet, sodium chloride 600 mg (approx. 10 mmol each of Na\(^+\) and Cl\(^-\)). Net price 100-tab pack = £0.05. Label: 25

Dose  prophylaxis of sodium chloride deficiency 4–8 tablets daily with water (in severe depletion up to max. 20 tablets daily)

Oral rehydration solutions used in the UK are lower in sodium, potassium, and glucose or another carbohydrate such as starch.

Oral rehydration solutions should:
- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;  
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss. Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

For intravenous rehydration see section 9.2.2.

ORAL REHYDRATION SALTS (ORS)

Indications  fluid and electrolyte loss in diarrhoea, see notes above

Dose  According to fluid loss, usually 200–400 mL solution after every loose motion; INFANT 1–1½ times usual feed volume; CHILD 200 mL after every loose motion

UK formulations  After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours

Dioralyte® (Sanofi-Aventis)

Oral powder, sodium chloride 470 mg, potassium chloride 300 mg, disodium hydrogen citrate 550 mg, glucose 3.56 g sachet, net price 6-sachet pack = £2.25, 20-sachet pack (black currant- or citrus-flavoured or natural) = £6.72
Note  Reconstitute 1 sachet with 200 mL of water (frequently boiled and cooled for infants). 5 sachets reconstituted with 1 litre of water provide Na\(^+\) 60 mmol, K\(^+\) 20 mmol, Cl\(^-\) 60 mmol, citrate 10 mmol, and glucose 90 mmol

Dioralyte® Relief (Sanofi-Aventis)

Oral powder, sodium chloride 350 mg, potassium chloride 300 mg, sodium citrate 580 mg, cooked rice powder 6 g/sachet, net price 6-sachet pack (apricot-, black currant- or raspberry-flavoured) = £2.50, 20-sachet pack (apricot-flavoured) = £7.13
Note  Reconstitute 1 sachet with 200 mL of water (frequently boiled and cooled for infants). 5 sachets reconstituted with 1 litre of water provide Na\(^+\) 60 mmol, K\(^+\) 20 mmol, Cl\(^-\) 60 mmol and citrate 10 mmol, contains aspartame (section 9.4.1)

Electrolade® (Actavis)

Oral powder, sodium chloride 236 mg, potassium chloride 300 mg, sodium bicarbonate 500 mg, anhydrous glucose 4 g/sachet (banana-, black currant-, lemon and lime-, or orange-flavoured). Net price 6-sachet pack (plain or multiflavoured) pack = £1.33, 20-sachet pack (single- or multiflavoured) pack = £4.99
Note  Reconstitute 1 sachet with 200 mL of water (frequently boiled and cooled for infants). 5 sachets reconstituted with 1 litre of water provide Na\(^+\) 90 mmol, K\(^+\) 20 mmol, Cl\(^-\) 40 mmol, HCO\(_3\)\(^-\) 30 mmol, and glucose 111 mmol

WHO formulation  Oral Rehydration Salts (Non-proprietary)

Oral powder, sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. To be dissolved in sufficient water to produce 1 litre (providing Na\(^+\) 75 mmol, K\(^+\) 20 mmol, Cl\(^-\) 65 mmol, citrate 10 mmol, glucose 75 mmol/litre)
Note  Recommended by the WHO and the United Nations Children’s Fund but not commonly used in the UK

9.2.1.3 Oral bicarbonate

Sodium bicarbonate is given by mouth for chronic acidicotic states such as ureamic acidosis of renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed; sodium bicarbonate 4.8 g daily (57 mmol each of Na\(^+\) and HCO\(_3\)\(^-\)) or more may be required. For severe metabolic acidosis, sodium bicarbonate can be given intravenously (section 9.2.2).

Sodium bicarbonate may also be used to increase the pH of the urine (see section 7.4.3); for use in dyspepsia see section 1.1.1.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where hyperchloraemic acidosis is associated with potassium deficiency, as in some renal tubular and gastro-intestinal disorders it may be appropriate to give oral potassium bicarbonate, although acute or severe deficiency should be managed by intravenous therapy.
**SODIUM BICARBONATE**

**Indications**  
see notes above

**Cautions**  
see notes above; avoid in respiratory acidosis; interactions: Appendix 1 (antacids)

**Hepatic Impairment**  
section 1.1.1

**Dose**

- See notes above

**Sodium Bicarbonate** (Non-proprietary)

**Capsules**, sodium bicarbonate 500 mg (approx. 6 mmol each of Na⁺ and HCO₃⁻), net price 56-cap pack = £5.16

**Tablets**, sodium bicarbonate 600 mg, net price 100 = £2.48

**Important** Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies, see p. 988; the strength of sodium bicarbonate should be stated on the prescription

**POTASSIUM BICARBONATE**

**Indications**  
see notes above

**Cautions**  
elderly; cardiac disease; interactions: Appendix 1 (potassium salts)

**Contra-indications**  
hypochloraemia; plasma-potassium concentration above 5 mmol/litre

**Renal impairment**  
close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

**Side-effects**  
nausea, vomiting, abdominal pain, diarrhoea, and flatulence

**Dose**

- See notes above

**Potassium Tablets, Effervescent** (Non-proprietary)

**Effervescent tablets**, potassium bicarbonate 500 mg, potassium acid tartrate 300 mg, each tablet providing 6.5 mmol of K⁺. To be dissolved in water before administration. Net price 56-cap pack = £33.38. Label: 13, 21

*Note* These tablets do not contain chloride; for effervescent tablets containing potassium and chloride, see under Potassium Chloride, section 9.2.1.1

9.2.2 Parenteral preparations for fluid and electrolyte imbalance

9.2.2.1 Electrolytes and water

9.2.2.2 Plasma and plasma substitutes

**9.2.2.1 Electrolytes and water**

Solutions of electrolytes are given intravenously to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% or glucose 5%) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance; for reference to the use of magnesium and phosphates, see section 9.5.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

**Intravenous sodium**

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in sodium depletion, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate. Excessive administration should be avoided; the jugular venous pressure should be assessed; the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

Compound sodium lactate (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloraemic acidosis.

Sodium chloride and glucose solutions are indicated when there is combined water and sodium depletion. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular. Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance. Illness or injury increase the secretion of antidiuretic hormone should ideally be secreted; it may reduce the risk of osmotic demyelination syndrome arising from inappropriate secretion of antidiuretic hormone and therefore the ability to excrete excess water may be impaired. Injudicious use of hypotonic solutions such as sodium chloride 0.18% and glucose 4% may also cause dilutional hyponatraemia especially in children and the elderly; if necessary, guidance should be sought from a clinician experienced in the management of fluid and electrolytes.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

**SODIUM CHLORIDE**

**Indications**  
electrolyte imbalance—see also section 9.2.1.2; nebuliser diluent (section 3.1.5); eye (section 11.8.1); oral hygiene (section 12.3.4); wound irrigation (section 13.11.1)
Cautions restrict intake in impaired renal function, cardiac failure, hypertension, peripheral and pulmonary oedema, toxemia of pregnancy

Side-effects administration of large doses may give rise to sodium accumulation, oedema, and hyperchloraeic acidosis

Dose

- See notes above

Sodium Chloride Intravenous Infusion (Non-proprietary)$$$\text{Intravenous infusion, usual strength sodium chloride 0.9\% (9 g, 150 mmol Na}^+\text{ and Cl}^–\text{/litre), this strength being supplied when normal saline for injection is requested. Net price 2-mL amp = £3.26; 5-mL amp = £3.86; 10-mL amp = £5.26; 20-mL amp = £8.26.}

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Note: The term ‘normal saline’ should not be used to describe sodium chloride intravenous infusion 0.9%; the term ‘physiological saline’ is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

With other ingredients

Sodium Chloride and Glucose Intravenous Infusion (Non-proprietary)$$$\text{Intravenous infusion, sodium chloride 0.18\% (Na}^+\text{ and Cl}^–\text{each 30 mmol/litre), glucose 4\%. In hospitals, usually 500-mL packs and sometimes other sizes are available.}

Intravenous infusion, sodium chloride 0.45\% (Na}^+\text{ and Cl}^–\text{each 75 mmol/litre), glucose 2.5\%. In hospitals, usually 500-mL packs and sometimes other sizes are available.}

Intravenous infusion, sodium chloride 0.45\% (Na}^+\text{ and Cl}^–\text{each 75 mmol/litre), glucose 5\%. In hospitals, usually 500-mL packs and sometimes other sizes are available.}

Intravenous infusion, sodium chloride 0.9\% (Na}^+\text{ and Cl}^–\text{each 150 mmol/litre), glucose 5\%. In hospitals, usually 500-mL packs and sometimes other sizes are available.}

Note: See above for warning on hyponatraemia especially in children and elderly

Ringer’s Solution for Injection $$$\text{Calcium chloride (dihydrate) 322 micrograms, potassium chloride 30 micrograms, sodium chloride 8.6 mg/mL, providing the following ions (in mmol/litre), Ca}^{2+}\text{ 2.2, K}^+\text{ 4, Na}^+\text{ 147, Cl}^–\text{ 156. In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available.}

Sodium Lactate Intravenous Infusion, Compound (Non-proprietary) $$$\text{(Hartmann’s Solution for Injection; Ringer-Lactate Solution for Injection) Intravenous infusion, sodium chloride 0.6\%, sodium lactate 0.32\%, potassium chloride 0.04\%, calcium chloride 0.027\% (containing Na}^+\text{ 131 mmol, K}^+\text{ 5 mmol, Ca}^{2+}\text{ 2 mmol, HCO}_3^–\text{ (as lactate) 29 mmol, Cl}^–\text{ 111 mmol/litre). In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available.}

Intravenous glucose

Glucose solutions (5\%) are used mainly to replace water deficit and should not be given alone except when there is no significant loss of electrolytes; prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition (section 9.3).

Glucose solutions are given in regimens with calcium and insulin for the emergency management of hyperkalaemia (see p. 595). They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

GLUCOSE (Dextrose Monohydrate)

Note: Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose

Indications fluid replacement (see notes above), provision of energy (section 9.3); hypoglycaemia (section 6.1.4)

Side-effects glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis

Dose

- Water replacement, see notes above; energy source, 1–3 litres daily of 20–50\% solution

Glucose Intravenous Infusion (Non-proprietary) $$$\text{Intravenous infusion, glucose or anhydrous glucose (potency expressed in terms of anhydrous glucose), usual strength 5\% (50 mg/mL), 10\% (100 mg/mL), and 20\% (200 mg/mL); 20\% solution, net price 20-mL amp = £2.04; 50\% solution, 20-mL amp = £9.50; 50-mL vial = £2.13. In hospitals, 500- and 1000-mL packs, and sometimes other sizes and strengths, are available; also available as Minipor\textsuperscript{®} Glucose, 50\% in 50-mL disposable syringes.}

1. \text{restriction does not apply where administration is for saving life in emergency}

Intravenous potassium

Potassium chloride and sodium chloride intravenous infusion is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth. Ready-mixed infusion solutions should be used when possible; alternatively, potassium chloride concentrate, as ampoules containing 1.5 g
Potassium Chloride Concentrate, Sterile (Non-proprietary) 
Sterile concentrate, potassium chloride 15% (150 mg, approximately 2 mmol each of K⁺ and Cl⁻ /mL). Net price 10-mL amp = 48p
Important Must be diluted with not less than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and mixed well
Solutions containing 10 and 20% of potassium chloride are also available in both 5- and 10-mL ampoules

Bicarbonate and lactate

Sodium bicarbonate is used to control severe metabolic acidosis (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock (section 2.7.1), for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously; plasma-pH and electrolytes should be monitored.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function. For chronic acidotic states, sodium bicarbonate can be given by mouth (section 9.2.1.3).
Water

Water for Injections

Net price 1-mL amp = £0.18; 2-mL amp = £0.20; 5-mL amp = £0.38; 10-mL amp = £0.78; 50-mL amp = £1.19; 100-mL vial = £2.01

9.2.2.2 Plasma and plasma substitutes

Plasma and plasma substitutes (‘colloids’) contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose (‘crystalloids’), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solutions, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma coagulation factors; they may be given without regard to the recipient’s blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solutions in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solutions (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solutions may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

ALBUMIN SOLUTION

(Human Albumin Solution)

A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

Indications see under preparations, and also notes above

Cautions history of cardiac or circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function); increased capillary permeability; correct dehydration when administering concentrated solution

Contra-indications cardiac failure; severe anaemia

Side-effects hypersensitivity reactions (including anaphylaxis) with nausea, vomiting, increased salivation, fever, tachycardia, hypotension and chills reported

Isotonic solutions

Indications: acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery; plasma exchange

Available as: Human Albumin Solution 4.5% (50-, 100-, 250- and 400-mL bottles—Baxter); Human Albumin Solution 5% (250- and 500-mL bottles—Baxter); Albunorm® 5% (100-, 250-, and 500-mL bottles—Octapharm); Octalbin® 5% (100- and 250-mL bottles—Octapharm); Zenalb® 4.5% (50-, 100-, 250-, and 500-mL bottles—BPL)

Concentrated solutions (20%)

Indications: severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required; adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn; paracentesis of large volume ascites associated with portal hypertension

Available as: Human Albumin Solution 20% (50- and 100-mL vials—Baxter); Albunorm® 20% (50- and 100-mL bottles—Octapharm); Flexalbin® 20% (50- and 100-mL bags—Baxter); Octalbin® 20% (50- and 100-mL bottles—Octapharm); Zenalb® 20% (50- and 100-mL bottles—BPL)

Plasma substitutes

Dextran, gelatin, and the etherified starches (hetastarch, pentastarch, and tetrastarch) are macromolecular substances which are metabolised slowly; they may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicemia. Plasma substitutes may be used as an immediate short-term measure to treat haemorrhage until blood is available. They are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also section 2.7.1 for the management of shock.

Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of some plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Dextran 70 by intravenous infusion is used for volume expansion. Dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

Cautions Plasma substitutes should be used with caution in patients with cardiac disease, liver disease, or renal impairment; urine output should be monitored. Care should be taken to avoid haematocrit concentra-
tion from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.

**Side-effects**  Hypersensitivity reactions may occur including, rarely, severe anaphylactic reactions. Transient increase in bleeding time may occur.

### DEXTRAN 70
Dextran of weight average molecular weight about “70 000”

**Indications** short-term blood volume expansion

**Cautions** see notes above; can interfere with some laboratory tests (see also above); where possible, monitor central venous pressure

**Pregnancy** avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death

**Side-effects** see notes above

**Dose**
- See under preparations below

### Hypertonic solution
**RescueFlow** (Vitaline)\(^{(Y)}\)

**Intravenous infusion**, dextran 70 intravenous infusion 6% in sodium chloride intravenous infusion 7.5%. Net price 250-mL bag = £28.50

**Cautions** see notes above; severe hyperglycaemia and hyperosmolality

**Dose** initial treatment of hypovolaemia with hypotension induced by traumatic injury, *by intravenous infusion* over 2–5 minutes, 250 mL, followed immediately by administration of isotonic fluids

### GELATIN
**Note** The gelatin is partially degraded

**Indications** low blood volume (but see notes above)

**Cautions** see notes above

**Pregnancy** manufacturer of Geloplasma\(^{(Y)}\) advises avoid at the end of pregnancy

**Side-effects** see notes above

**Dose**
- *By intravenous infusion*, initially 500–1000 mL of a 3.5–4% solution (see notes above)

**Gelofusine** (Braun)\(^{(Y)}\)

**Intravenous infusion**, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na\(^+\) 154 mmol, Cl\(^-\) 125 mmol/litre, net price 500-mL bag = £4.70, 1-litre bag = £9.09

**Isoplex** (Beacon)\(^{(Y)}\)

**Intravenous infusion**, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na\(^+\) 154 mmol, Cl\(^-\) 125 mmol/litre, net price 500-mL bag = £4.70, 1-litre bag = £9.09

**Volplex** (Beacon)\(^{(Y)}\)

**Intravenous infusion**, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na\(^+\) 154 mmol, Cl\(^-\) 125 mmol/litre, net price 500-mL bag = £4.70, 1-litre bag = £9.09

### Etherified Starch
A starch composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the terms tetrasacth, pentastarch, and hetastarch reflect the degree of etherification

**Indications** low blood volume

**Cautions** see notes above; children

**Renal impairment** use with caution in mild to moderate impairment; avoid in severe impairment

**Side-effects** see notes above; also pruritus, raised serum amyrase

**Dose**
- *See under preparations below*

### Hetastarch
**Hetastarch** (Non-proprietary)\(^{(Y)}\)

**Intravenous infusion**, hetastarch (weight average molecular weight 450 000) 6% in sodium chloride intravenous infusion 0.9%, net price 500-mL bag = £8.00

**Dose** *by intravenous infusion*, 500–1000 mL; usual daily max. 1500 mL (see notes above)

### Pentastarch
**Pentastarch** (Non-proprietary)\(^{(Y)}\)

**Intravenous infusion**, pentastarch (weight average molecular weight 200 000) 10% in sodium chloride intravenous infusion 0.9%, net price 500 mL = £16.50

**Dose** *by intravenous infusion*, up to 1500 mL daily (see notes above)

### HAES-steril
**HAES-steril** (Fresenius Kabi)\(^{(Y)}\)

**Intravenous infusion**, pentastarch (weight average molecular weight 200 000) 10% in sodium chloride intravenous infusion 0.9%, net price 500 mL = £16.50

**Dose** *by intravenous infusion*, up to 1500 mL daily (see notes above)

### Hemohes
**Hemohes** (Braun)\(^{(Y)}\)

**Intravenous infusion**, pentastarch (weight average molecular weight 200 000), net price (both in sodium chloride intravenous infusion 0.9%) 6%, 500 mL = £12.50; 10%, 500 mL = £16.50

**Cautions** see notes above

**Dose** *by intravenous infusion*, pentastarch 6%, up to 2500 mL daily; pentastarch 10 %, up to 1500 mL daily (see notes above)

### Tetrasacth
**Tetrasacth** (Braun)\(^{(B)}\)

**Intravenous infusion**, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride 0.625%, containing Na\(^+\) 140 mmol, K\(^+\) 1 mmol, Mg\(^2\+) 1 mmol, Cl\(^-\) 118 mmol, Ca\(^2\+) 2.5 mmol, acetate 24 mmol, malate 5 mmol/litre, net price 500–1000 mL = £13.50

**Dose** *by intravenous infusion*, up to 50 mL/kg daily (see notes above)

### Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 10% in sodium chloride 0.625%, containing Na\(^+\) 140 mmol, K\(^+\) 4 mmol, Mg\(^2\+) 1 mmol, Cl\(^-\) 118 mmol, Ca\(^2\+) 2.5 mmol, acetate 24 mmol, malate 5 mmol/litre, net price 500–1000 mL = £17.50

**Dose** *by intravenous infusion*, up to 30 mL/kg daily (see notes above)

### Venofundin
**Venofundin** (Braun)\(^{(Y)}\)

**Intravenous infusion**, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride 0.625%, containing Na\(^+\) 140 mmol, K\(^+\) 4 mmol, Mg\(^2\+) 1 mmol, Cl\(^-\) 118 mmol, Ca\(^2\+) 2.5 mmol, acetate 24 mmol, malate 5 mmol/litre, net price 500–1000 mL = £17.50

**Dose** *by intravenous infusion*, up to 30 mL/kg daily (see notes above)
9 Nutrition and blood

The use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes (see also section 9.2.2). Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes. Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcal) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 20–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphenation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives should not be mixed with fat emulsions unless compatibility is known.

Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases product literature and other specialist literature should be consulted.

---

9.3 Intravenous nutrition

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Indications for this method include preparation of undereemboured patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure.

The composition of proprietary preparations available is given in the table Proprietary Infusion Fluids for Parenteral Feeding, p. 603.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁₂, as hydroxocobalamin, is given by intramuscular injection; regular vitamin B₁₂ injections are not usually required unless total parenteral nutrition continues for many months. Folic acid is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include

9.4 Oral nutrition

9.4.1 Foods for special diets

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS)—see Appendix 7.

Phenylketonuria
Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Sapropterin, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

Coeliac disease
Intolerance to gluten in coeliac disease is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription—see Appendix 7, p. 925.

Sapropterin dihydrochloride
Note: Sapropterin is a synthetic form of tetrahydrobiopterin

Indications see under Dose below

Cautions monitor blood-phenylalanine concentration before and after first week of treatment—if this is indicated in the BNF against the preparation; the patient should be informed of this.
unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month; monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment; history of convulsions

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises caution—consider only if strict dietary management inadequate

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** diarrhoea, vomiting, abdominal pain; nasal congestion, cough, pharyngolaryngeal pain; headache

**Dose**
- Phenylketonuria (specialist use only), by mouth, **ADULT** and **CHILD** over 4 years, initially 10 mg/kg once daily, preferably in the morning, adjusted according to response; usual dose 5–20 mg/kg daily
- Tetrahydrobiopterin deficiency (specialist use only), by mouth, **ADULT** and **CHILD** initially 2–5 mg/kg once daily, preferably in the morning, adjusted according to response; max. 20 mg/kg daily; total daily dose may alternatively be given in 2–3 divided doses

**Kuvan®** (Merck Serono)▼ ▼ ▼ ▼

**Dispersible tablets**, sapropterin dihydrochloride 100 mg, net price 30-tab pack = £597.22, 120-tab pack = £3388.88. Label: 13, 21

**Counselling** Tablets should be dissolved in water and taken within 20 minutes

### 9.4.2 Enteral nutrition

The body’s reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds (preparations, see Appendix 7).

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows’ milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed. Feeds containing vitamin K may affect the INR in patients receiving warfarin—see interactions: Appendix 1 (vitamins).

**Children** Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought; see also BNF for Children, section 9.4.2

**Preparations**

See Borderline Substances, Appendix 7.

### 9.5 Minerals

- **Calcium and magnesium**
  - **Calcium supplements**
  - **Hypercalcaemia and hypercalciuria**
  - **Magnesium**

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate, see also Osteoporosis, p. 469 and Vitamin D, p. 617.

In severe acute hypercalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of 10–20 mL of calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. For infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Calcium chloride injection is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia (see also section 9.6.4). Concurrent

BNF 61

9.4.2 Enteral nutrition
hypomagnesaemia should be corrected with magnesium sulphate (section 9.5.1.3).

For the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia, see p. 595.

**CALCIUM SALTS**

**Indications** see notes above; calcium deficiency

**Cautions** sarcoidosis; history of nephrolithiasis; avoid calcium chloride in respiratory acidosis or respiratory failure; **interactions:** Appendix 1 (antacids, calcium salts)

**Contra-indications** conditions associated with hypercalcaemia and hypercalciuria (e.g. some forms of malignant disease)

**Renal impairment** use with caution (but see also Calcium Gluconate injection, below)

**Side-effects** gastro-intestinal disturbances; bradycardia, arrhythmias; with injection, peripheral vasodilatation, fall in blood pressure, injection-site reactions, severe tissue damage with extravasation

**Dose**
- **By mouth,** daily in divided doses, see notes above
- **By slow intravenous injection,** acute hypocalcaemia, calcium gluconate 1–2 g (Ca\(^2\)+ 2.25–4.5 mmol); **CHILD** see BNF for Children
- **By continuous intravenous infusion,** acute hypocalcaemia, see notes above

**Oral preparations**

**Calcium Gluconate** *(Non-proprietary)*

- **Effervescent tablets,** calcium gluconate 1 g (calcium 89 mg or Ca\(^2\)+ 2.23 mmol), net price 28-tab pack = £14.83. **Note** Each tablet usually contains 4.46 mmol Na\(^+\)

**Calcium Lactate** *(Non-proprietary)*

- **Tablets,** calcium lactate 300 mg (calcium 39 mg or Ca\(^2\)+ 1 mmol), net price 84 = £2.92

**Adcal\(^\text{®}\)** *(ProStrakan)*

- **Chewable tablets,** fruit flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca\(^2\)+ 15 mmol), net price 100-tab pack = £7.25. **Label:** 24

**Cacit** *(Warner Chilcott)*

- **Tablets,** effervescent, pink, calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca\(^2\)+ 12.5 mmol), net price 76-tab pack = £11.81. **Label:** 13

**Calcichew\(^\text{®}\)** *(Shire)*

- **Tablets** (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca\(^2\)+ 12.5 mmol), net price 100-tab pack = £9.33. **Label:** 24

- **Forte tablets** (chewable), orange flavour, scored, calcium carbonate 2.5 g (calcium 1 g or Ca\(^2\)+ 25 mmol), net price 60-tab pack = £13.16. **Label:** 24

**Calcium-500** *(Martindale)*

- **Tablets,** pink, f/c, calcium carbonate 1.25 g (calcium 500 mg or Ca\(^2\)+ 12.5 mmol), net price 100-tab pack = £9.46. **Label:** 25

**Calcium-Sandoz\(^\text{®}\)** *(Alliance)*

- **Syrup,** orange flavour, calcium gluconate 1.09 g, calcium lactobionate 727 mg (calcium 108.3 mg or Ca\(^2\)+ 2.7 mmol)/5 mL, net price 300 mL = £4.07

**Parenteral preparations**

**Calcium Gluconate** *(Non-proprietary)* *(Full)*

**Injection,** calcium gluconate 10% (calcium 8.4 mg or Ca\(^2\)+ 226 micromol/mL), net price 10-mL amp = 60p

**Note** The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended

**Calcium Chloride** *(Non-proprietary)* *(Full)*

**Injection,** calcium chloride dihydrate 10% (calcium 27.3 mg or Ca\(^2\)+ 680 micromol/mL), net price 10-mL disposable syringe = £5.10

**Brands include Minigel® Calcium Chloride 10%**

**Injection,** calcium chloride dihydrate 13.4% (calcium 36 mg or Ca\(^2\)+ 910 micromol/mL), net price 10-mL amp = £14.94

**With vitamin D**

Section 9.6.4

**With disodium etidronate**

Section 6.6.2

**With risedronate sodium and colecalciferol**

Section 6.6.2

**9.5.1.2 Hypercalcaemia and hypercalciuria**

**Severe hypercalcaemia** Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9%. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If severe hypercalcaemia persists drugs which inhibit mobilisation of calcium from the skeleton may be required. The bisphosphonates are useful and disodium pamidronate (section 6.6.2) is probably the most effective.

**Corticosteroids** (section 6.3) are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

**Calcitonin** (section 6.6.1) is relatively non-toxic but its effect can wear off after a few days despite continued use; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. Further treatment is
Nutrition and blood

9

Governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcemia should be avoided; oral administration of a bisphosphonate may be useful.

Hyperparathyroidism Cinacalcet is licensed for the treatment of secondary hyperparathyroidism in dialysis patients with end-stage renal disease (but see NICE guidance below), for primary hyperparathyroidism in patients where parathyroidectomy is inappropriate, and for the treatment of hypercalcemia in parathyroid carcinoma. Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

Paricalcitol (section 9.6.4) is also licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure. Parathyroidectomy may be indicated for hyperparathyroidism.

NICE guidance

Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007)

Cinacalcet is not recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy.

Cinacalcet is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) only in those:

- who have ‘very uncontrolled’ plasma concentration of intact parathyroid hormone (defined as greater than 85 picomol/litre) refractory to standard therapy, and a normal or high adjusted serum calcium concentration, and

- in whom surgical parathyroidectomy is contraindicated, in that the risks of surgery outweigh the benefits.

Response to treatment should be monitored regularly and treatment should be continued only if a reduction in the plasma concentration of intact parathyroid hormone of 30% or greater is seen within 4 months of treatment.

Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide in a dose of 2.5 mg daily (a higher dose is not usually necessary). Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

CINACALCET

Indications see under Dose and notes above

Cautions measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma; treatment should not be initiated in patients with hypocalcaemia; in secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months; dose adjustment may be necessary if smoking started or stopped during treatment; interactions: Appendix 1 (cinacalcet)

Hepatic impairment manufacturer advises caution in moderate to severe impairment—monitor closely especially when increasing dose

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects nausea, vomiting, anorexia; dizziness, paraesthesia, arthria; reduced testosterone concentrations; myalgia; rash; less commonly dyspepsia, diarrhoea, and seizures; hypotension, heart failure, and allergic reactions (including angioedema) also reported

Dose

- Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis (but see notes above), ADULT over 18 years, initially 30 mg once daily, adjusted every 2–4 weeks to max. 180 mg daily
- Hyperparathyroidism or parathyroid carcinoma, ADULT over 18 years, initially 30 mg twice daily, adjusted every 2–4 weeks according to response up to max. 90 mg 4 times daily

Mimpara® (Amgen) 30 mg, green, f/c, cinacalcet (as hydrochloride) tablets, green, f/c, cinacalcet (as hydrochloride) 30 mg, net price 28-tab pack = £121.36; 60 mg, 28-tab pack = £223.87; 90 mg, 28-tab pack = £335.81.

Label: 21

9.5.1.3 Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton. Magnesium salts are not well absorbed from the gastrointestinal systems, particularly those involved in energy generation. Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypomagnesaemia (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia Since magnesium is secreted in large amounts in the gastro-intestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia. Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg²⁺ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulphate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion.
and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in a dose of 24 mmol Mg²⁺ daily in divided doses; suitable preparations are magnesium glycerophosphate tablets or liquid [unlicensed], available from ‘special-order’ manufacturers or specialist importing companies, see p. 988. For maintenance (e.g. in intravenous nutrition), parenteral doses of magnesium are of the order of 10–20 mmol Mg²⁺ daily (often about 12 mmol Mg²⁺ daily).

Arrhythmias Magnesium sulphate has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes (see also section 2.3.1). The usual dose of magnesium sulphate by intravenous injection is 2 g (8 mmol Mg²⁺) over 10–15 minutes (repeated once if necessary).

Myocardial infarction Limited evidence that magnesium sulphate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulphate for this purpose is not recommended. For the management of myocardial infarction, see section 2.10.1.

Eclampsia and pre-eclampsia Magnesium sulphate is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with eclampsia. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Mycardial infarction Magnesium sulphate also of benefit in women with pre-eclampsia in whom there is concern about developing eclampsia. The patient should be monitored carefully (see under Magnesium Sulphate).

Magnesium Sulphate

**Indications**
- Hypomagnesaemia, see notes above
- Arrhythmias, see notes above
- Prevention of seizures in pre-eclampsia [unlicensed indication], initially by intravenous injection over 5–15 minutes, 4 g followed by intravenous infusion, 1 g/hour for 24 hours; if seizure occurs, additional dose by intravenous injection, 2 g
- Treatment of seizures and prevention of seizure recurrence in eclampsia, initially by intravenous injection over 5–15 minutes, 4 g, followed by intravenous infusion, 1 g/hour for 24 hours after seizure or delivery, whichever is later; if seizure recurs, increase the infusion rate to 1.5–2 g/hour or give an additional dose by intravenous injection, 2 g
- Intrapartum administration For intravenous injection concentration of magnesium sulphate should not exceed 20% (dilute 1 part of magnesium sulphate injection 50% with at least 1.5 parts of water for injection)

**Note** Magnesium sulphate (as heptahydrate) 1 g equivalent to Mg²⁺ approx. 4 mmol

**Magnesium Sulphate (Non-proprietary)**
- **Injection**, magnesium sulphate (as heptahydrate) 20% (Mg²⁺ approx. 0.8 mmol/mL), net price 20-mL (4-g) amp = £2.75; 50% (Mg²⁺ approx. 2 mmol/mL), 2-mL (1-g) amp = £2.39, 4-mL (2-g) prefilled syringe = £7.39, 5-mL (2.5-g) amp = £3.00, 10-mL (5-g) amp = 69p, 10-mL (5-g) prefilled syringe = £4.95

**Brands include**
- **Minigel® Magnesium Sulphate 50%**

**Phosphorus**

**Phosphate supplements**

**Phosphate-binding agents**

**Oral phosphate supplements** may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets. Diarrhoea is a common side-effect and should prompt a reduction in dosage.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. For established hypophosphataemia, monobasic potassium phosphate may be infused at a rate of 9 mmol every 12 hours. In critically ill patients, the dose of phosphate can be increased up to 500 micromol/kg (approx. 30 mmol in adults, max. 50 mmol), infused over 6–12 hours, according to severity. Excessive doses of phosphates may cause hypocalcaemia and metastatic calcification; it is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes.

For phosphate requirements in total parenteral nutrition regimens, see section 9.3.

**Phosphates**

**Intravenous infusion**, phosphates (providing PO₄³⁻ 100 mmol, K⁺ 19 mmol, and Na⁺ 162 mmol/litre), net price 500 mL (Polyfuor®) = £3.75.

For the treatment of moderate to severe hypophosphataemia
Phosphate-Sandoz® (HK Pharma)

**Tablets**, effervescent, anhydrous sodium acid phosphate 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na⁺ 20.4 mmol), potassium 123 mg (K⁺ 3.1 mmol). Net price 20 = £3.29. Label: 13

**Dose** vitamin D-resistant hypophosphataemic osteomalacia, 4–6 tablets daily. *CHILD* under 5 years 2–3 tablets daily

### 9.5.2.2 Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

**Sevelamer hydrochloride** and sevelamer carbonate are both licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/L or more.

**Lanthanum** is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/L or more.

**Lanthanum** is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

### Phosphate-binding agents

#### ALUMINIUM HYDROXIDE

**Indications** hyperphosphataemia; dyspepsia (section 1.1)

**Cautions** see notes above; **interactions**: Appendix 1 (antacids)

**Side-effects** constipation; hyperaluminaemia

**Alu-Cap®** (Meda)

**Capsules**, green/red, dried aluminium hydroxide 475 mg (low Na⁺), net price 120-cap pack = £3.75

**Dose** phosphate-binding agent in renal failure, 4–20 capsules daily in divided doses with meals

#### CALCIUM SALTS

**Indications** hyperphosphataemia

**Cautions** interactions: Appendix 1 (antacids, calcium salts)

**Contra-indications** hypercalcaemia, hypercalciuria

**Side-effects** hypercalcaemia

**Adcal**® section 9.5.1.1

**Calcichew**® section 9.5.1.1

**Calcium-500** section 9.5.1.1

**Phosex**® (Vitaline)

**Tablets**, yellow, scored, calcium acetate 1 g (calcium 250 mg or Ca²⁺ 6.2 mmol), net price 180-tab pack = £19.79. Counselling, do not chew, with meals

**Dose** initially 1 tablet 3 times daily with meals, adjusted according to serum-phosphate concentration (usual dose 1–4 tablets daily (1 or 2 tablets with each meal)); max. 12 tablets daily

**PhosLo**® (Fresenius Medical Care)

**Capsules**, calcium acetate (anhydrous) 667 mg (calcium 169 mg or Ca²⁺ 4.2 mmol), net price 200-cap pack = £14.40. Counselling, with meals

**Excipients** include propylene glycol (see Excipients, p. 2)

**Dose** initially 2 capsules with each meal, adjusted according to serum-phosphate concentration (usual dose 3 or 4 capsules with each meal)

#### With magnesium carbonate

**Osvaren**® (Fresenius Medical Care)

**Tablets**, f/c, scored, calcium acetate 435 mg (calcium 110 mg or Ca²⁺ 2.7 mmol), heavy magnesium carbonate 235 mg (magnesium 60 mg), net price 180-tab pack = £24.00. Counselling, do not crush or chew, with meals, avoid other drugs at same time (see below)

**Contra-indications** hypercalcaemia, hypermagnesaemia; third-degree AV block; myasthenia gravis

**Dose** **ADULT** over 18 years, initially 1 tablet 3 times daily with meals, adjusted according to serum-phosphate concentration (usual dose 3–10 tablets daily); max. 12 tablets daily

**Counselling** Manufacturers advise that other drugs should be taken at least 2 hours before or 3 hours after *Osvaren*® to reduce possible interference with absorption of other drugs

#### LANTHANUM

**Indications** see notes above

**Cautions** acute peptic ulcer; ulcerative colitis; Crohn’s disease; bowel obstruction; monitor liver function; **interactions**: Appendix 1 (lanthanum)

**Hepatic impairment** use with caution

**Pregnancy** manufacturer advises avoid—toxicity in animal studies

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** gastro-intestinal disturbances; hypocalcaemia; less commonly anorexia, increased appetite, taste disturbances, dry mouth, thirst, stomatitis, chest pain, peripheral oedema, headache, dizziness, vertigo, asthenia, fatigue, malaise, hyperglycaemia, hyperparathyroidism, hypercalcaemia, hypophosphataemia, eosinophilia, arthralgia, myalgia, osteoporosis, sweating, alopecia, pruritus, and erythematous rash; accumulation of lanthanum in bone, and transient changes in QT interval also reported

**Dose**

- **ADULT** over 18 years, initially 750 mg daily in divided doses chewed with or immediately after meals, adjusted according to serum-phosphate concentration every 2–3 weeks (usual dose range 1.5–3 g daily in divided doses)

**Fosrenol**® (Shire)

**Tablets** (chewable), lanthanum (as carbonate hydrate) 500 mg, net price 90-tab pack = £114.13; 750 mg, 90-tab pack = £152.17; 1 g, 90-tab pack = £161.33. Label: 21, counselling, to be chewed
SEVELAMER HYDROCHLORIDE

Indications hyperphosphataemia in patients on haemodialysis or peritoneal dialysis
Cautions gastrointestinal disorders; interactions: Appendix 1 (sevelamer)
Contra-indications bowel obstruction
Pregnancy manufacturer advises use only if potential benefit outweighs risk
Breast-feeding manufacturer advises use only if potential benefit outweighs risk
Side-effects nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; very rarely intestinal obstruction; also reported intestinal perforation, ileus, diverticulitis, pruritus, rash
Dose
• ADULT over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration (usual dose range 2.4–12 g daily in 3 divided doses)

Renagel® (Genzyme) tablets, f/c, sevelamer hydrochloride 800 mg, net price 180-tab pack = £117.97. Label: 25, counselling, with meals
Excipients include propylene glycol (see Excipients, p. 2)

SEVELAMER CARBONATE

Indications hyperphosphataemia in patients on haemodialysis or peritoneal dialysis, and patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/L or more
Cautions gastrointestinal disorders; interactions: Appendix 1 (sevelamer)
Contra-indications bowel obstruction
Pregnancy manufacturer advises use only if potential benefit outweighs risk
Breast-feeding unlikely to be present in milk (however, manufacturer advises avoid)
Side-effects nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; also reported intestinal obstruction and perforation, ileus, pruritus, rash
Dose
• ADULT over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration every 2–4 weeks (usual dose range 6 g daily in 3 divided doses)

Renvela® (Genzyme) tablets, f/c, sevelamer carbonate 800 mg, net price 180-tab pack = £117.97. Label: 25, counselling, with meals
Excipients include propylene glycol (see Excipients, p. 2)

Pregnancy

Breast-feeding

Side-effects

Dose

Contra-indications

Cautions

Interactions

Appendix 1 (sevelamer)

FLUORIDES

Note Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion

Indications prophylaxis of dental caries—see notes above
Contra-indications not for areas where drinking water is fluoridated
Side-effects occasional white flecks on teeth with recommended doses; rarely yellowish-brown discoloration if recommended doses are exceeded

Dose

Note Dose expressed as fluoride ion (\(\text{F}^-\))

• Water content less than \(\text{F}^-\) 300 micrograms/litre (0.3 parts per million), CHILD up to 6 months none; 6 months–3 years F\(^-\) 250 micrograms daily, 3–6 years F\(^-\) 500 micrograms daily, over 6 years F\(^-\) 1 mg daily

• Water content between F\(^-\) 300 and 700 micrograms/litre (0.3–0.7 parts per million), CHILD up to 3 years none, 3–6 years F\(^-\) 250 micrograms daily, over 6 years F\(^-\) 500 micrograms daily

• Water content above F\(^-\) 700 micrograms/litre (0.7 parts per million), supplements not advised

Note These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (Br Dent J 1997; 182: 6–7)

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride. Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales; for details see preparations, p. 614). There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.
Fluoride supplements not considered necessary below 6 months of age (see notes above)

Fluoride Tablets

- **En-De-Kay** (Manx)
  - **Flutabs 3–6 years**, orange-flavoured, scored, sodium fluoride 1.1 mg (F⁻ 500 micrograms), net price 200-tab pack = £2.38
  - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets
  - **Flutabs 6+ years**, orange-flavoured, scored, sodium fluoride 2.2 mg (F⁻ 1 mg), net price 200-tab pack = £2.38
  - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

- **Fluor-a-day** (Dental Health)
  - **Tablets**, buff, sodium fluoride 1.1 mg (F⁻ 500 micrograms), net price 200-tab pack = £2.54
  - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

- **FluorGard** (Colgate-Palmolive)
  - **Tablets 0.5**, purple, grape-flavoured, scored, sodium fluoride 1.1 mg (F⁻ 500 micrograms), net price 200-tab pack = £1.91
  - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets
  - **Tablets 1.0**, orange, orange-flavoured, scored, sodium fluoride 2.2 mg (F⁻ 1 mg), net price 200-tab pack = £1.91
  - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Oral drops**

- Note Fluoride supplements not considered necessary below 6 months of age (see notes above)

**En-De-Kay** (Manx)

- **Fluorodrops** (≡ paediatric drops), sugar-free, sodium fluoride 550 micrograms (F⁻ 250 micrograms)/0.15 mL. Net price 60 mL = £2.38
- **Dental prescribing on NHS** Corresponds to Sodium Fluoride Oral Drops DPF 0.37% equivalent to sodium fluoride 80 micrograms (F⁻ 36 micrograms)/drop

**Mouthwashes**

- Rinse mouth for 1 minute and spit out
- **Counselling** Avoid eating, drinking, or rinsing mouth for at least 30 minutes after use

**Duraphat** (Colgate-Palmolive)

- **Weekly dental rinse** (≡ mouthwash), blue, sodium fluoride 0.2%. Net price 150 mL = £2.13. Counselling, see above
- **Dose** CHILD 6 years and over, for weekly use, rinse with 10 mL
- **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.2%

**En-De-Kay** (Manx)

- **Daily fluoride mouthrinse** (≡ mouthwash), blue, sodium fluoride 0.05%. Net price 250 mL = £1.51
- **Dose** CHILD 6 years and over, for daily use, rinse with 10 mL
- **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

**Fluorinse** (≡ mouthwash), red, sodium fluoride 2%. Net price 100 mL = £4.97. Counselling, see above
- **Dose** CHILD 8 years and over, for daily use, dilute 5 drops to 10 mL of water; for weekly use, dilute 20 drops to 10 mL
- **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 2%

---

**Fluoride tablets**

- **Fluoride Oral Drops** (Colgate-Palmolive)
  - **Dose** CHILD 6 years and over, for daily use, rinse with 10 mL
  - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

- **Fluoride Mouthwash 2%** (Duraphat, = mouthwash), blue, sodium fluoride 0.05%. Net price 500 mL = £2.61. Counselling, see above

- **Fluoride Tablets**
  - **Fluor-a-day** (Dental Health)
    - **Tablets**, buff, sodium fluoride 1.1 mg (F⁻ 500 micrograms), net price 200-tab pack = £2.54
    - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets
  - **FluorGard** (Colgate-Palmolive)
    - **Tablets 0.5**, purple, grape-flavoured, scored, sodium fluoride 1.1 mg (F⁻ 500 micrograms), net price 200-tab pack = £1.91
    - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets
    - **Tablets 1.0**, orange, orange-flavoured, scored, sodium fluoride 2.2 mg (F⁻ 1 mg), net price 200-tab pack = £1.91
    - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

---

9.5.4 Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoprothrominaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease (section 9.8.1), or in zinc-losing states.

Parenteral nutrition regimens usually include trace amounts of zinc (section 9.3). If necessary, further zinc can be added to intravenous feeding regimens. A suggested dose for intravenous nutrition is elemental zinc 6.5 mg (Zn⁺² 100 micromol) daily.

**FluoriGard** (Colgate-Palmolive)

- **Daily dental rinse** (= mouthwash), blue, sodium fluoride 0.05%. Net price 500 mL = £2.61. Counselling, see above
- **Dose** CHILD 6 years and over, for daily use, rinse with 10 mL
- **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

**Gels**

- **FluoriGard** (Colgate-Palmolive)
  - **Gel-Kam** (= gel), stannous fluoride 0.4% in glycerol basis. Net price 100 mL = £2.63. Counselling, see below
  - **Dose** ADULT and CHILD 3 years and over, for daily use, using a toothbrush, apply onto all tooth surfaces
  - **Counselling** Swish between teeth for 1 minute before spitting out
  - **Avoid** eating, drinking, or rinsing mouth for at least 30 minutes after use

**Toothpastes**

- **Duraphat** (Colgate-Palmolive) (≡ mouthwash), blue, sodium fluoride 0.619%. Net price 75 mL = £3.26, dual pack (2 × 75 mL) = £5.54. Counselling, see below
  - **Dose** ADULT and CHILD over 10 years, apply 1 cm twice daily using a toothbrush
  - **Counselling** Brush teeth for 1 minute before spitting out
  - **Avoid** drinking or rinsing mouth for 30 minutes after use
  - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Toothpaste 0.619%
  - **Duraphat** *5000 ppm* toothpaste, sodium fluoride 1.1%. Net price 51 g = £6.50. Counselling, see below
  - **Dose** ADULT and ADOLESCENT over 16 years, apply 2 cm 3 times daily after meals using a toothbrush
  - **Counselling** Brush teeth for 3 minutes before spitting out
  - **Dental prescribing on NHS** May be prescribed as Sodium Fluoride Toothpaste 1.1%

---

9.5.4 Zinc

**Indications** zinc deficiency or supplementation in zinc-losing conditions

**Cautions** interactions: Appendix 1 (zinc)

**Renal impairment** accumulation may occur in acute renal failure

**Pregnancy** crosses placenta; risk theoretically minimal, but no information available

**Breast-feeding** present in milk; risk theoretically minimal, but no information available
Side-effects  abdominal pain, dyspepsia, nausea, vomiting, diarrhoea, gastric irritation; irritability, headache, lethargy

Dose  ● See preparation below and notes above

Zinc Sulphate  (Non-proprietary)
Injection, zinc sulphate 14.6 mg/mL (zinc 50 micro-mol/mL), net price 10 mL vial = £2.50

Solvazinc® (Galen)
Effervescent tablets, zinc sulphate monohydrate 125 mg (45 mg zinc), net price 30 = £4.32. Label: 13, 21
Dose  ADULT and CHILD over 30 kg, 1 tablet in water 1–3 times daily after food; CHILD under 10 kg, ½ tablet daily; 10–30 kg, ½ tablet 1–3 times daily

9.5.5 Selenium

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

SELENIUM

Indications selenium deficiency
Cautions interactions: Appendix 1 (selenium)
Dose  ● By mouth or by intramuscular injection or by intravenous injection, 100–500 micrograms daily

Selenase® (Oxford Nutrition)
Oral solution, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL amp = £1.03, 10-mL bottle = £4.05
Injection, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL amp = £1.50, 10-mL vial = £4.25

9.6 Vitamins

9.6.1 Vitamin A

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption). Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

Pregnancy  In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish-liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.

VITAMIN A  (Retinol)

Indications see notes above
Cautions see notes above; interactions: Appendix 1 (vitamins)
Pregnancy  excessive doses may be teratogenic; see also notes above
Breast-feeding  theoretical risk of toxicity in infants of mothers taking large doses
Side-effects see notes above
Dose  ● See notes above and under preparations

>Vitamins A and D

Halibut-liver Oil  (Non-proprietary)
Capsules, vitamin A 4000 units [also contains vitamin D], net price 100-cap pack = £1.05

Vitamins A and D  (Non-proprietary)
Capsules, vitamin A 4000 units, vitamin D 400 units, net price 84-cap pack = £3.44
Note  May be difficult to obtain

>Vitamins A, C and D

Healthy Start Children’s Vitamin Drops  (Non-proprietary)
Oral drops, vitamin A 5000 units, vitamin D 2000 units, ascorbic acid 150 mg/mL
Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to

Dietary reference values for vitamins are available in the Department of Health publication:

Dental patients  It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment. Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.
9 Nutrition and blood

9.6.2 Vitamin B group

Deficiency of the B vitamins, other than vitamin B12 (section 9.1.2), is rare in the UK and is usually treated by preparations containing thiamine (B1), riboflavin (B2), and nicotinamide, which is used in preference to nicotinic acid, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol, and pantothenic acid or pyridoxine may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke’s encephalopathy and Korsakoff’s psychosis, especially as seen in chronic alcoholism (section 4.10.1), are best treated initially by parenteral administration of vitamin B (see MHRA/CHM advice, below). Followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with thiamine followed by oral administration of alcoholism (section 4.10.1), are best treated initially by

Note Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information on where to obtain supplies.

Breast-feeding severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk

Indications

see notes above

Cautions

anaphylaxis may occasionally follow injection (see MHRA/CHM advice below)

MHRA/CHM advice (September 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

1. This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;

2. Intravenous administration should be by infusion over 30 minutes;

3. Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

RIBOFLAVIN

(Riboflavin, vitamin B2)

Indications

see notes above

Preparations

Injections of vitamins B and C, see under Thiamine

Oral vitamin B complex preparations

See p. 617

Oral vitamin B complex preparations

See p. 617

Note

Pabrinex® doses in BNF may differ from those in product literature
PYRIDOXINE HYDROCHLORIDE
(Vitamin B₆)

**Indications**  see under Dose

**Cautions**  interactions: Appendix 1 (vitamins)

**Side-effects**  sensory neuropathy reported with high doses given for extended periods

**Dose**
- Deficiency states, 20–50 mg up to 3 times daily
- Isoniazid-induced neuropathy, prophylaxis 10 mg daily (or 20 mg daily if suitable product not available); treatment, 50 mg three times daily; CHILD under 18 years see BNF for Children
- Idiopathic sideroblastic anaemia, 100–400 mg daily in divided doses
- Penicillamine-induced neuropathy, prophylaxis in Wilson’s disease [unlicensed use] (see also notes above), 20 mg daily; CHILD under 18 years see BNF for Children
- Premenstrual syndrome [unlicensed use], 50–100 mg daily (see notes above)

Prolonged use of pyridoxine in a dose of 10 mg daily is considered safe but the long-term use of pyridoxine in a dose of 200 mg or more daily has been associated with neuropathy. The safety of long-term pyridoxine supplementation with doses above 10 mg daily has not been established.

**Pyridoxine (Non-proprietary)**
- Tablets, pyridoxine hydrochloride 10 mg, net price 500 = £8.53; 20 mg, 500 = £8.53; 50 mg, 28 = £1.52

**Injections of vitamins B and C**
See under Thiamine

NICOTINAMIDE

**Indications**  see notes above; acne vulgaris, see section 13.6.1

**Injections of vitamins B and C**
See under Thiamine

Oral vitamin B complex preparations

Note  Other multivitamin preparations are in section 9.6.7.

**Vitamin B Tablets, Compound**
- Tablets, nicotinamide 15 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, net price 28 = £1.00
- Dose  prophylactic, 1–2 tablets daily

**Vitamin B Tablets, Compound, Strong**
- Tablets, brown, f/c or s/c, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, riboflavin 2 mg, thiamine hydrochloride 5 mg. Net price 28 tablets pack = £2.30
- Dose  treatment of vitamin-B deficiency, 1–2 tablets 3 times daily

**Vigranon B** (Wallace Mfg)
- Syrup, thiamine hydrochloride 5 mg, riboflavin 2 mg, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, panthenol 3 mg/5 mL. Net price 150 mL = £2.41

Other compounds

Potassium aminobenzoate has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma but its therapeutic value is doubtful.

**Potaba®** (Glenwood)
- Capsules, potassium aminobenzoate 500 mg, net price 240 = £35.80. Label: 21
- Envules® (= powder in sachets), potassium aminobenzoate 3 g, net price 40 sachets = £27.45. Label: 13, 21
- Dose  Peyronie’s disease, scleroderma, 12 g daily in divided doses after food

9.6.3 Vitamin C  
(Ascorbic acid)

Vitamin C therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly. It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

**Ascorbic Acid**

**Indications**  prevention and treatment of scurvy

**Cautions**  interactions: Appendix 1 (vitamins)

**Dose**
- Prophylactic, 25–75 mg daily; therapeutic, not less than 250 mg daily in divided doses

**Ascorbic Acid (Non-proprietary)**
- Tablets, ascorbic acid 50 mg, net price 28 = £1.79; 100 mg, 28 = £1.42; 200 mg, 28 = £1.42; 500 mg (label: 24), 28 = £2.34
- Brands include Redoxon®
- Injection, ascorbic acid 100 mg/mL. Net price 5-mL amp = £4.39

Available from UCB Pharma

9.6.4 Vitamin D

**Note**  The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol (calciferol, vitamin D₂), colecalciferol (vitamin D₃), dihydrotachysterol, alfalcidol (1α-hydroxycholecalciferol), and calcitriol (1,25-dihydroxycholecalciferol).

Simple vitamin D deficiency can be prevented by taking an oral supplement of only 10 micrograms (400 units) of ergocalciferol (calciferol, vitamin D₂) or colecalciferol (vitamin D₃) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these
individuals, ergocalciferol or colecalciferol in a dose of 20 micrograms (800 units) daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for severe deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing calcium with colecalfilerol are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency (see also Osteoporosis, p. 469 and Calcium Supplements, p. 608).

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses, such as ergocalciferol tablets up to 1 mg (40 000 units) daily; the hypocalcaemia of hypoparathyroidism often requires doses of up to 2.5 mg (100 000 units) daily in order to achieve normocalcaemia.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfacalcidol or calcitriol should be prescribed if patients with severe renal impairment require vitamin D therapy. Calcitriol is also licensed for the management of post-menopausal osteoporosis.

Paricalcitol, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure (section 9.5.1.2).

Important. All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

### Ergocalciferol

(Calciferol, Vitamin D₂)

**Indications** see notes above

**Cautions** take care to ensure correct dose in infants; monitor plasma-calcium concentration in patients receiving high doses and in renal impairment (see notes above); interactions: Appendix 1 (vitamins)

**Contra-indications** hyperparathyroidism; metastatic calcification

**Pregnancy** high systemic doses teratogenic in animals but therapeutic doses unlikely to be harmful

**Breast-feeding** caution with high systemic doses; may cause hyperparathyroidism in infant—monitor serum-calcium concentration

**Side-effects** symptoms of overdosage include anorexia, listlessness, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine

**Dose**

- See notes above

**Daily supplements**

Note There is no plain vitamin D tablet available for treating simple deficiency (see notes above). Alternatives include vitamin capsules (section 9.6.7), preparations of vitamins A and D (section 9.6.8), and calcium and ergocalciferol tablets (see below).

For prescribing information on calcium, see section 9.5.1.1

### Calcium and Ergocalciferol

(Non-proprietary)

**Calcium and Vitamin D**

**Tablets**, calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca²⁺ 2.4 mmol), ergocalciferol 10 micrograms (400 units). Net price 28-tab pack = £7.10. Counselling, crush before administration or may be chewed

#### Pharmacological strengths

Note The BP directs that when calciferol is prescribed or demanded, colecalfilerol or ergocalciferol should be dispensed or supplied

### Ergocalciferol (Non-proprietary)

**Tablets**, ergocalciferol 250 micrograms (10 000 units), net price 100 = £21.99; 1.25 mg (50 000 units), 100 = £30.34

Note May be difficult to obtain

Important When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained

**Injection**, for intramuscular use only, ergocalciferol, 7.5 mg (300 000 units)/mL in oil, net price 1-mL amp = £8.50, 2-mL amp = £9.85

### Alfacalcidol (1α-Hydroxycholecalciferol)

**Indications** see notes above

**Cautions** see under Ergocalciferol; also nephrolithiasis

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol; also rarely nephrocalcinosis, pruritus, rash, and urticaria

**Dose**

- By mouth or by intravenous injection over 30 seconds, ADULT and CHILD over 20 kg, initially 1 microgram daily (elderly 500 nanograms), adjusted to avoid hypercalcaemia; maintenance, usually 0.25–1 microgram daily; NEONATE and PRETERM NEONATE initially 50–100 nanograms/kg daily, CHILD under 20 kg initially 50 nanograms/kg daily

**Alfacalcidol (Non-proprietary)**

**Capsules**, alfacalcidol 250 nanograms, net price 30-cap pack = £5.94; 500 nanograms 30-cap pack = £11.64; 1 microgram 30-cap pack = £15.91

**One-Alpha® (LEO)**

**Capsules**, alfacalcidol 250 nanograms (white), net price 30-cap pack = £3.37; 500 nanograms (red), 30-cap pack = £6.27; 1 microgram (brown), 30-cap pack = £8.75

**Excipients** include sesame oil

**Oral drops**, sugar-free, alfacalcidol 2 micrograms/mL (1 drop contains approx. 100 nanograms), net price 10 mL = £22.49

**Excipients** include alcohol

Note The concentration of alfacalcidol in One-Alpha® drops is 10 times greater than that of the former preparation One-Alpha® solution

**Injection**, alfacalcidol 2 micrograms/mL, net price 0.5-mL amp = £2.16, 1-mL amp = £4.11

**Excipients** include alcohol, propylene glycol (caution in neonates, see Excipients, p. 2)

**Note** Shake ampoule for at least 5 seconds before use

### Calcitriol (1,25-Dihydroxycholecalciferol)

**Indications** see notes above

**Cautions** see under Ergocalciferol; monitor plasma calcium, phosphate, and creatinine during dosage titration
BNF 61

6.6.4 Vitamin D 619

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol

**Dose**
- **By mouth**, renal osteodystrophy, initially 250 nanograms daily, or on alternate days (in patients with normal or only slightly reduced plasma-calcium concentration), increased if necessary in steps of 250 nanograms at intervals of 2–4 weeks; usual dose 0.5–1 microgram daily; **CHILD** not established
- Established postmenopausal osteoporosis, 250 nanograms twice daily (monitor plasma-calcium concentration and creatinine, consult product literature)

- **By intravenous injection** (or injection through catheter after haemodialysis), hypocalcaemia in dialysis patients with chronic renal failure, initially 500 nanograms (approx. 10 nanograms/kg) 3 times a week; increased if necessary in steps of 250–500 nanograms at intervals of 2–4 weeks; usual dose 0.5–3 micrograms 3 times a week; **CHILD** see **BNF for Children**

Moderate to severe secondary hyperparathyroidism in dialysis patients, initially 0.5–4 micrograms 3 times a week, increased if necessary in steps of 250–500 nanograms at intervals of 2–4 weeks; max. 8 micrograms 3 times a week

**Calcitriol** (Non-proprietary)

**Capsules**, calcitriol 250 nanograms, net price 30-cap pack = £18.04, 100-cap pack = £19.15; 500 nanograms, 30-cap pack = £32.25, 100-cap pack = £56.76

**Roocaltrol** (Roche)

**Capsules**, calcitriol 250 nanograms (red/white), net price 100 = £18.04; 500 nanograms (red), 100 = £32.25

**Calcijex** (Abbott)

**Injection**, calcitriol 1 microgram/mL, net price 1-mL amp = £5.14; 2 micrograms/mL, 1-mL amp = £10.28

**Colecalciferol** (Cholecalciferol, vitamin D₃)

**Indications** see notes above

**Cautions** see under Ergocalciferol

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol

**Dose**
- **See notes above**

**Colecalciferol** (Non-proprietary)

**Capsules**, colecalciferol 20 000 units

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

**With calcium**

For prescribing information on calcium, see section 9.5.1.1

**Adcal-D₃** (ProStrakan)

**Tablets** (chewable) (lemon or tutti-frutti flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £3.89, 112-tab pack = £7.78. **Label**: 24

**Dissolve** (effervescent tablets), lemon flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £4.99. **Label**: 13

**Cacit** D₃ (Warner Chilcott)

**Granules**, effervescent, lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet, net price 30-sachet pack = £4.06. **Label**: 13

**Calceos** (Galen)

**Tablets** (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.62. **Label**: 24

**Calchew-D₃** (Shire)

**Calchew-D₃ Tablets** (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 100-tab pack = £7.68. **Exipients include** aspartame (section 9.4.1)

**Calchew-D₃ Forte Tablets** (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £4.32, 100-tab pack = £7.21. **Label**: 24

**Exipients include** aspartame, see **Exipients**, p. 2

**Calfovit D₃** (Menarini)

**Powder**, lemon flavour, calcium carbonate 3.1 g (calcium 1.2 g or Ca²⁺ 30 mmol), colecalciferol 20 micrograms (800 units), net price 30-sachet pack = £4.32. **Label**: 13, 21

**Natecal D₃** (Chiesi)

**Tablets** (chewable), (aniseed, peppermint, and molasses flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.63. **Label**: 24

**Exipients include** aspartame (section 9.4.1)

**Sandocal®+D** (Novartis Consumer Health)

**Sandocal®+D 600 tablets**, effervescent, orange flavour, calcium lactate gluconate 1.36 g, calcium carbonate 1.05 g, providing calcium 600 mg (Ca²⁺ 15 mmol), colecalciferol concentrate 4 mg, providing colecalciferol 10 micrograms (400 units), net price 60-tab pack = £5.35, 100-tab pack = £8.75. **Label**: 13

**Exipients include** aspartame (section 9.4.1)

**Sandocal®+D 1200 tablets**, effervescent, orange flavour, calcium lactate gluconate 2.72 g, calcium carbonate 2.1 g, providing calcium 1200 mg (Ca²⁺ 30 mmol), colecalciferol concentrate 8 mg, providing colecalciferol 20 micrograms (800 units), net price 30-tab pack = £4.32. **Label**: 13

**Exipients include** aspartame (section 9.4.1)

**With alendronic acid**

Section 6.6.2

**With risedronate sodium and calcium**

Section 6.6.2
**DIHYDROTACHYSTEROL**

**Indications** see notes above

**Cautions** see under Ergocalciferol

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol

**AT 10® (intraharm) Oral solution**, dihydrotachysterol 250 micrograms/mL. Net price 15-mL dropper bottle = £22.87

Excipients include arachis (peanut) oil

**Dose** acute, chronic, and latent forms of hypocalcaemic tetany due to hypoparathyroidism, consult product literature

**PARICALCITOL**

**Indications** see under preparations below

**Cautions** monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised; monitor parathyroid hormone concentration; interactions: Appendix 1 (vitamins)

**Contra-indications** see under Ergocalciferol

**Pregnancy** toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk; see also under Ergocalciferol

**Breast-feeding** manufacturer advises caution—no information available; see also under Ergocalciferol

**Side-effects** see under Ergocalciferol; also dyspepsia, taste disturbance, breast tenderness, acne, pruritus, and rash

**Dose** consult product literature

Zemplar® (Abbott) [Non-proprietary]

**Capsules**, paricalcitol 1 microgram (grey), net price 28-cap pack = £89.44; 2 micrograms (orange-brown), 28-cap pack = £138.88; 4 micrograms (gold), 28-cap pack = £277.76

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure

**Injection**, paricalcitol 5 micrograms/mL, net price 1-mL amp = £12.40, 2-mL amp = £24.80. For injection via haemodialysis access

Excipients include propylene glycol, see Excipients, p. 2

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure in patients on haemodialysis

**ALPHA TOCOPHERYL ACETATE**

**Indications** see notes above

**Cautions** predisposition to thrombosis; increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg; interactions: Appendix 1 (vitamins)

**Pregnancy** no evidence of safety of high doses

**Breast-feeding** excreted in milk; minimal risk, although caution with large doses

**Side-effects** diarrhoea and abdominal pain with doses more than 1 g daily

Vitamin E Suspension (Non-proprietary) Suspension, alpha tocopheryl acetate 500 mg/5 mL.

Net price 100 mL = £30.55

**Dose** malabsorption in cystic fibrosis, 100–200 mg daily; CHILD 1 month–1 year 50 mg daily; 1–12 years, 100 mg daily

Malabsorption in abetalipoproteinaemia, ADULT and CHILD 50–100 mg/kg daily

Malabsorption in chronic cholestasis and severe liver disease, CHILD see BNF for Children

Note Tablets containing tocopheryl acetate are available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

**ALPHA TOCOPHEROL**

**Indications** vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis

**Cautions** predisposition to thrombosis; interactions: Appendix 1 (Vitamin E)

**Contra-indications** preterm neonates

**Hepatic impairment** manufacturer advises caution and monitor closely—no information available

**Renal impairment** manufacturer advises caution and monitor closely; risk of renal toxicity due to polyethylene glycol content

**Pregnancy** manufacturer advises caution, no evidence of harm in animal studies

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** diarrhoea; less commonly asthenia, headache, disturbances in serum-potassium and serum-sodium concentrations, alopecia, pruritus, and rash

Vedrop® (Orphan Europe) [Non-proprietary]

**Oral solution**, yellow, n-alpha tocopherol (as tocopherol) 30 mg/mL, net price 20 mL = £54.55, 60 mL = £163.65 (all with oral syringe)

Note Tocodrol is a water-soluble form of n-alpha tocopherol

Dose CHILD under 18 years, 17 mg/kg daily, adjusted as necessary

**9.6.5 Vitamin E (Tocopherols)**

The daily requirement of vitamin E has not been well defined but is probably about 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

**9.6.6 Vitamin K**

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadiol sodium phosphate is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.
Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K; for advice on the use of vitamin K in haemorrhage, see section 2.8.2.

**Vitamin K deficiency bleeding** Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as phytomenadione) 1 mg may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies. For preterm neonates, see *BNF for Children*.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione 2 mg should be given by mouth in the first week; the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione 2 mg is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione 1 mg by mouth at birth (using the contents of a phytomenadione capsule, see preparation below) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione 1 mg are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

### Menadiol Sodium Phosphate

**Indications** see notes above

**Cautions** G6PD deficiency (section 9.1.5) and vitamin E deficiency (risk of haemolysis); *interactions*: Appendix 1 (vitamins)

**Contra-indications** neonates and infants

**Pregnancy** avoidance in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate

**Dose**

- 10–40 mg daily, adjusted as necessary; **CHILD** 1–12 years, 5–10 mg daily, adjusted as necessary, 12–18 years, 10–20 mg daily, adjusted as necessary

**Menadil Phosphate** (Non-proprietary)

**Tablets** menadil sodium phosphate equivalent to 10 mg of menadil phosphate, net price 100-tab pack = £58.39

### Phytomenadione

**Vitamin K**

**Indications** see notes above

**Cautions** intravenous injections should be given very slowly (see also below); *interactions*: Appendix 1 (vitamins)

**Pregnancy** use if potential benefit outweighs risk

**Breast-feeding** present in milk, but see notes above

**Dose**

- See notes above and section 2.8.2

**Neokay** (Neoceuticals)  

**Capsules**, brown, phytomenadione 1 mg in an oily basis, net price 12-cap pack = £3.95; 100-cap pack = £34.00

**Note** The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given

### Colloidal formulation

**Konakion** MM (Roche)  

**Injection**, phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 1-mL amp = 38p

**Excipients** include glycocholic acid 54.6 mg/amp, lecithin

**Cautions** reduce dose in elderly, liver impairment (glycocholic acid may displace bilirubin); reports of anaphylactoid reactions

**Note** Konakion® MM may be administered by slow intravenous injection or by intravenous infusion in glucose 5% (see Appendix 6); not for intramuscular injection

**Konakion** MM Paediatric (Roche)  

**Injection**, phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 0.2-mL amp = 95p

**Excipients** include glycocholic acid 10.9 mg/amp, lecithin

**Cautions** parenteral administration in neonate of less than 2.5 kg (increased risk of kernicterus)

**Note** Konakion® MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection

### 9.6.7 Multivitamin preparations

**Vitamins**

**Capsules**, ascorbic acid 15 mg, nicotinamide 7.5 mg, riboflavin 500 micrograms, thiamine hydrochloride 1 mg, vitamin A 2500 units, vitamin D 300 units, net price 28-cap pack = £1.50

**Abidec** (Chefaro UK)

**Drops**, vitamins A, B group, C, and D, net price 25 mL (with dropper) = £2.20

**Excipients** include arachis (peanut) oil

**Note** Contains 1333 units of vitamin A (as palmitate) per 0.6-mL dose

**Dalivit** (LPC)  

**Oral drops**, vitamins A, B group, C, and D, net price 25 mL = £2.98, 50 mL = £4.85

**Note** Contains 5000 units of vitamin A (as palmitate) per 0.6-mL dose

**Vitamin and mineral supplements and adjuncts to synthetic diets**

**Forceval** (Alliance)  

**Capsules**, brown/red, vitamins (ascorbic acid 60 mg, biotin 100 micrograms, cyanocobalamin 3 micrograms, folic acid 400 micrograms, nicotinamide 18 mg, pantothenic acid 4 mg, pyridoxine 2 mg, riboflavin 1.6 mg, thiamine 1.2 mg, vitamin A 2500 units, vitamin D, 400 units, vitamin E 10 mg, minerals and trace elements (calcium 100 mg, chromium 200 micrograms, copper 2 mg, iodine 140 micrograms, iron 12 mg, magnesium 30 mg, manganese
3 mg, molybdenum 250 micrograms, phosphorus 77 micrograms, potassium 4 mg, selenium 50 micrograms, zinc 15 mg), net price 15-cap pack = £2.83, 30-cap pack = £5.19, 90-cap pack = £12.53. Label: 25

**Dose** vitamin and mineral deficiency and as adjunct in synthetic diets. ADULT 1 capsule daily one hour after a meal.

**Junior capsules**, brown, vitamins (ascorbic acid 25 mg, biotin 50 micrograms, cyanocobalamin 2 micrograms, folic acid 100 micrograms, nicotinamide 7.5 mg, pantothenic acid 2 mg, pyridoxine 1 mg, riboflavin 1 mg, thiamine 1.5 mg, vitamin A 1250 units, vitamin D3 200 units, vitamin E 5 mg, vitamin K1 25 micrograms), minerals and trace elements (chromium 50 micrograms, copper 1 mg, iodine 75 micrograms, iron 5 mg, magnesium 1 mg, manganese 1.25 mg, molybdenum 50 micrograms, selenium 25 micrograms, zinc 5 mg), net price 30-cap pack = £5.32, 60-cap pack = £6.69

**Dose** vitamin and mineral deficiency and as adjunct in synthetic diets. CHILD over 5 years, 2 junior capsules daily

**Ketovite** (Paines & Byrne)

- **Tablets** (Paine, yellow, ascorbic acid 16.6 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, pyridoxine hydrochloride 330 micrograms, nicotinamide 3.3 mg, calcium pantothenate 1.16 mg, alpha tocopheryl acetate 5 mg, inositol 50 mg, biotin 170 micrograms, folic acid 25 micrograms, acetylsalicylic acid 500 micrograms, net price 100-tab pack = £4.17

**Dose** prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 1 tablet 3 times daily; use with Ketovite® Liquid for complete vitamin supplementation

- **Liquid**, pink, sugar-free, vitamin A 2500 units, ergocalciferol 400 units, choline chloride 150 mg, cyano-cobalamin 12.5 micrograms/5 mL, net price 150-mL pack = £2.70

**Dose** prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 5 mL daily; use with Ketovite® Tablets for complete vitamin supplementation

---

### 9.7 Bitters and tonics

Mixtures containing simple and aromatic bitters are traditional remedies for loss of appetite; there is no evidence to support their use.

### 9.8 Metabolic disorders

#### 9.8.1 Drugs used in metabolic disorders

**Acute porphyrias**

**Indications** Wilson’s disease in patients intolerant of penicillamine; it is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

**Zinc** prevents the absorption of copper in Wilson’s disease. Symptomatic patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

**Wilson’s disease**

Penicillamine (see also section 10.1.3) is used in Wilson’s disease (hepatolenticular degeneration) to aid the elimination of copper ions. See below for other indications.

**Trientine** is used for the treatment of Wilson’s disease only in patients intolerant of penicillamine; it is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

**Penicillamine**

**Indications** see under Dose below

**Cautions** section 10.1.3; also neurological involvement in Wilson’s disease

**Contra-indications** section 10.1.3

**Renal impairment** section 10.1.3

**Pregnancy** section 10.1.3

**Breast-feeding** section 10.1.3

**Side-effects** section 10.1.3; also neuropathy (especially if previous neurological involvement in Wilson’s disease—prophylactic pyridoxine recommended, see section 9.6.2)

**Dose**

- Wilson’s disease, 1.5–2 g daily in divided doses before food; max. 2 g daily for 1 year; maintenance 0.75–1 g daily; **ELDERLY** 20 mg/kg daily in divided doses, adjusted according to response; **CHILD** under 12 years see **BNF for Children**

- Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids), initially 500 mg daily in divided doses increased slowly over 3 months; usual maintenance dose 1.25 g daily; **ELDERLY** not recommended

- Cystinuria, therapeutic, 1–3 g daily in divided doses before food, adjusted to maintain urinary cystine below 200 mg/litre; prophylactic (maintain urinary cystine below 300 mg/litre) 0.5–1 g at bedtime; maintain adequate fluid intake (at least 3 litres daily); **CHILD** and **ELDERLY** minimum dose to maintain urinary cystine below 200 mg/litre

- Severe active rheumatoid arthritis, section 10.1.3

**Preparations**

Section 10.1.3

**Trientine dihydrochloride**

**Indications** Wilson’s disease in patients intolerant of penicillamine

**Cautions** see notes above; **Interactions**: Appendix 1 (trientine)

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk; monitor maternal and neonatal serum-copper concentration; teratogenic in animal studies

**Side-effects** nausea, rash; very rarely anaemia; duodenitis and colitis also reported
Carnitine deficiency
Carnitine is available for the management of primary carnitine deficiency due to inborn errors of metabolism or of secondary deficiency in haemodialysis patients.

CARNITINE

Indications primary and secondary carnitine deficiency
Cautions diabetes mellitus; monitoring of free and acyl carnitine in blood and urine recommended.
Renal impairment accumulation of metabolites may occur with chronic oral administration in severe impairment
Pregnancy appropriate to use; no evidence of teratogenicity in animal studies
Side-effects nausea, vomiting, abdominal pain, diarrhoea, body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase
Dose
- Primary deficiency, by mouth, up to 200 mg/kg daily in 2–4 divided doses; higher doses of up to 400 mg/kg daily occasionally required; usual max. 3 g daily.

AGALSIDASE ALFA and BETA

Indications Fabry’s disease (specialist use only)
Cautions interactions: Appendix 1 (agalsidase alfa and beta)
Infusion-related reactions infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an anti-histamine, antipyretic, or corticosteroid—consult product literature
Pregnancy use with caution
Breast-feeding use with caution—no information available
Side-effects gastro-intestinal disturbances, taste disturbances; tachycardia, bradycardia, palpitation, hypertension, hypotension, chest pain, oedema, flushing, dyspnoea, cough, rhinorrhoea; headache, fatigue, dizziness, asthenia, paraesthesia, syncope, neuropathic pain, tremor, sleep disturbances; influenza-like symptoms, nasopharyngitis; muscle spasms, myalgia, arthralgia; eye irritation; tinnitus; hypersensitivity reactions, angioedema, pruritus, urticaria, rash, acne, less commonly cold extremities, parosmia, ear pain and swelling, skin discoloration, and injection-site reactions
Fabrazyme® (Genzyme) intravenous injection over 2–3 minutes, up to 100 mg/kg daily in 3–4 divided doses
- Secondary deficiency, by intravenous injection over 2–3 minutes, 20 mg/kg after each dialysis session (dosage adjusted according to plasma-carnitine concentration); maintenance (if benefit gained from first intravenous course), by mouth, 1 g daily
Agalsidase beta, net price 5-mg vial = £315.08; 35-mg vial = £1068.64
Dose By intravenous infusion, ADULT and CHILD over 8 years 1 mg/kg every 2 weeks
Replagal® (Shire HGT) Concentrate for intravenous infusion, agalsidase alfa 1 mg/mL, net price 1-mL vial = £356.85; 3.5-mL vial = £1068.64
Dose By intravenous infusion, ADULT and CHILD over 7 years 200 micrograms/kg every 2 weeks

9.8.1 Drugs used in metabolic disorders

ZINC ACETATE

Indications Wilson’s disease (initiated under specialist supervision)
Cautions portal hypertension (risk of hepatic decompensation when switching from chelating agent); monitor full blood count and serum cholesterol;
interactions: Appendix 1 (zinc)
Pregnancy reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion
Breast-feeding manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant
Side-effects gastric irritation (usually transient; may be reduced if first dose taken mid-morning or with a little protein); less commonly sideroblastic anaemia and leucopenia
Dose
Note Dose expressed as elemental zinc
- Wilson’s disease, 50 mg 3 times daily (max. 50 mg 5 times daily), adjusted according to response; CHILD 1–6 years, 25 mg twice daily; 6–18 years, body-weight under 57 kg, 25 mg 3 times daily; body-weight over 57 kg, 50 mg 3 times daily; ADOLESCENT 16–18 years, 50 mg 3 times daily
Wilzin® (Orphan Europe) Capsules, zinc (as acetate) 25 mg (blue), net price 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23

Carnitine Dihydrochloride (Univar) Capsules, trientine dihydrochloride 300 mg. Label: 6, 22

Dose
- ADULT and CHILD over 12 years, 1.2–2.4 g daily in 2–4 divided doses before food; CHILD 2–12 years, initially 0.6–1.5 g daily in 2–4 divided doses before food, adjusted according to response

Trientine Dihydrochloride (Univar) Dose
Side-effects nausea, vomiting, abdominal pain, diarrhoea, body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase
Dose
- Primary deficiency, by mouth, up to 200 mg/kg daily in 2–4 divided doses; higher doses of up to 400 mg/kg daily occasionally required; usual max. 3 g daily; by intravenous injection over 2–3 minutes, up to 100 mg/kg daily in 3–4 divided doses
- Secondary deficiency, by intravenous injection over 2–3 minutes, 20 mg/kg after each dialysis session (dosage adjusted according to plasma-carnitine concentration); maintenance (if benefit gained from first intravenous course), by mouth, 1 g daily
Carnitor® (Sigma-Tau) Capsules, trientine dihydrochloride 300 mg. Label: 6, 22

Dose
- ADULT and CHILD over 12 years, 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23
**Gaucher’s disease**

Imiglucerase, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher’s disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

Velaglucerase alfa, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for the treatment of type 1 Gaucher’s disease.

Miglulstat, an inhibitor of glucosylceramide synthase, is licensed for the treatment of mild to moderate type 1 Gaucher’s disease in patients for whom enzyme replacement therapy is unsuitable; it is given by mouth; see p. 627.

**IMIGLUCERASE**

**Indications** (specialist use only) non-neurological manifestations of type I or type III Gaucher’s disease

**Cautions** monitor for imiglucerase antibodies; when stabilised, monitor all parameters and response to treatment at intervals of 6–12 months

**Pregnancy** manufacturer advises use with caution

**Breast-feeding** no information available

**Side-effects** hypersensitivity reactions (including urticaria, angioedema, cyanosis, hypotension, flushing, tachycardia, paraesthesia, backache); less commonly nausea, vomiting, diarrhoea, abdominal cramps, headache, dizziness, fatigue, fever, arthralgia, and injection-site reactions

**Dose**
- By intravenous infusion, initially 60 units/kg once every 2 weeks (doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly, but not bone parameters); maintenance, adjust dose according to response

**Cerezyme** (Genzyme)

*Intravenous infusion*, powder for reconstitution, imiglucerase, net price 200-unit vial = £535.65; 400-unit vial = £1071.29

**Electrolytes** Na⁺ 0.62 mmol/200-unit vial, 1.24 mmol/400-unit vial

**VELAGLUCERASE ALFA**

**Indications** (specialist use only) type 1 Gaucher’s disease

**Cautions** monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa

**Infusion-related reactions** Infusion-related reactions very common, manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, abdominal pain, tachycardia, hypertension, hypotension, flushing, headache, dizziness, malaise, pyrexia, arthralgia, bone pain, back pain, hypersensitivity reactions, rash, urticaria

**Dose**
- By intravenous infusion, ADULT and CHILD over 5 years, 1 mg/kg once weekly

Naglazyme® (BioMarin) ▼ ial

Concentrate for intravenous infusion, galsulfase 1 mg/mL, net price 5-mL vial = £982.00

**Mucopolysaccharidosis**

Laronidase, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

Idursulfase, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

Galsulfase, a recombinant form of human N-acetylgalactosamine-4-sulfatase, is licensed for long-term replacement therapy in mucopolysaccharidosis VI (Maroteaux-Lamy syndrome).

**Infusion-related reactions** Infusion-related reactions often occur with administration of laronidase, idursulfase, and galsulfase; they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

**GALSULFASE**

**Indications** (specialist use only) mucopolysaccharidosis VI

**Cautions** respiratory disease; acute febrile or respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** abdominal pain, umbilical hernia, gastrointestinal; chest pain, hypertension; dyspnoea, apnoea, nasal congestion; rigors, malaise, areflexia; pharyngitis; conjunctivitis, corneal opacity, ear pain; facial oedema

**Dose**
- By intravenous infusion, ADULT and CHILD over 5 years, 1 mg/kg once weekly

**IDURSULFASE**

**Indications** (specialist use only) mucopolysaccharidosis II

**Cautions** severe respiratory disease; acute febrile respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above
Contra-indications women of child-bearing potential
Pregnancy manufacturer advises avoid
Breast-feeding manufacturer advises avoid—present in milk in animal studies
Side-effects gastro-intestinal disturbances, swollen tongue; arrhythmia, tachycardia, chest pain, cyanosis, peripheral oedema, hypertension, hypotension, flushing; bronchospasm, hypoxia, cough, wheezing, tachypnoea, dyspnoea; headache, dizziness, tremor; pyrexia; arthralgia; facial oedema, urticaria, pruritus, rash, infusion-site swelling, erythema; pulmonary embolism and anaphylaxis also reported
Dose
- By intravenous infusion, ADULT and CHILD over 5 years, 500 micrograms/kg once weekly

Elaprase® (Shire HGT) ▼ TFM
Concentrate for intravenous infusion, idursulfase 2 mg/mL, net price 3-mL vial = £1985.00

LARONIDASE
Indications (specialist use only) non-neurological manifestations of mucopolysaccharidosis I
Cautions monitor immunoglobulin G (IgG) antibody concentration; interactions: Appendix 1 (laronidase)
Infusion-related reactions See notes above
Pregnancy manufacturer advises avoid unless essential—no information available
Breast-feeding manufacturer advises avoid—no information available
Side-effects nausea, vomiting, diarrhoea, abdominal pain; cold extremities, pallor, flushing, tachycardia, blood pressure changes; dyspnoea, cough, angioedema, anaphylaxis; headache, paraesthesia, dizziness, fatigue, restlessness; influenza-like symptoms; musculoskeletal pain and respiratory arrest also reported
Dose
- By intravenous infusion, 100 units/kg once weekly; CHILD see BNF for Children

Aldurazyme® (Genzyme) ▼ TFM
Concentrate for intravenous infusion, laronidase 100 units/mL, net price 5-mL vial = £444.70
Electrolytes Na+ 1.29 mmol/5-mL vial

Pompe disease
Alglucosidase alfa, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

ALGLUCOSIDASE ALFA
Indications (specialist use only) Pompe disease
Cautions cardiac and respiratory dysfunction—monitor closely; monitor immunoglobulin G (IgG) antibody concentration
Infusion-related reactions Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid, consult product literature for details
Pregnancy toxicity in animal studies, but treatment should not be withheld
Breast-feeding manufacturer advises avoid—no information available
Side-effects nausea, vomiting, diarrhoea; flushing, tachycardia, blood pressure changes, cold extremities, cyanosis, facial oedema, chest discomfort; cough, tachypnoea, bronchospasm; headache, agitation, tremor, irritability, restlessness, paraesthesia, dizziness, fatigue, pyrexia; antibody formation; myalgia, muscle spasm; sweating, rash, pruritus, urticaria, injection-site reactions; hypersensitivity reactions (including anaphylaxis); severe skin reactions (including ulcerative and necrotising skin lesions) also reported
Dose
- By intravenous infusion, ADULT and CHILD 20 mg/kg every 2 weeks

Myozyme® (Genzyme) ▼ TFM
Intravenous infusion, powder for reconstitution, alglucosidase alfa, net price 50-mg vial = £356.06

Nephropathic cystinosis
Mercaptamine is available for the treatment of nephropathic cystinosis.

MERCAPTAMINE (Cysteamine)
Indications (specialist use only) nephropathic cystinosis
Cautions leucocyte-cystine concentration and haematological monitoring required—consult product literature; dose of phosphate supplement may need to be adjusted
Contra-indications hypersensitivity to mercaptamine or penicillamine

Pregnancy avoid—teratogenic and toxic in animal studies
Breast-feeding avoid
Side-effects breath and body odour, nausea, vomiting, diarrhoea, anorexia, lethargy, fever, rash; also reported dehydration, hypertension, abdominal discomfort, gastroenteritis, drowsiness, encephalopathy, headache, nervousness, depression, anemia, leukopenia; rarely gastro-intestinal ulceration and bleeding, seizures, hallucinations, urticaria, interstitial nephritis
Dose
- Initial doses should be one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks
- Maintenance, ADULT and CHILD over 50 kg body-weight, 2 g daily in 4 divided doses
CHILD up to 12 years, 1.3 g/m² (approx. 50 mg/kg) daily in 4 divided doses

Cystagon® (Orphan Europe) ▼ TFM
Capsules, mercaptamine (as bitartrate) 50 mg, net price 100-cap pack = £70.00; 150 mg, 100-cap pack = £190.00
Note CHILD under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice)
Tyrosinaemia type 1
Nitisinone is licensed for the treatment of hereditary tyrosinaemia type 1 in combination with dietary restriction of tyrosine and phenylalanine.

SODIUM PHENYL BUTYRATE
Indications adjunct in long-term treatment of urea cycle disorders (under specialist supervision)
Cautions congestive heart failure; interactions: Appendix 1 (sodium phenylbutyrate)
Hepatic impairment manufacturer advises caution
Renal impairment manufacturer advises caution
Pregnancy avoid—toxicity in animal studies; manufacturer advises adequate contraception during administration
Breast-feeding manufacturer advises avoid—no information available
Side-effects gastro-intestinal disturbances, weight gain, taste disturbance, decreased appetite; syncope, oedema, headache, depression, irritability; renal tubular acidosis, menstrual disorders; blood disorders, metabolic acidosis, alkalosis; rash, body odour; less commonly rectal bleeding, peptic ulcer, pancreatitis, and arrhythmias
Dose • ADULT and CHILD body-weight over 20 kg, 9.9–13 g/m² daily in divided doses with meals (max. 20 g daily); CHILD body-weight less than 20 kg, 450–600 mg/kg daily in divided doses with meals
Ammonaps® (Swedish Orphan)
Tablets, sodium phenylbutyrate 500 mg. Contains Na+ 2.7 mmol/tablet. Net price 250-tab pack = £493.00
Granules, sodium phenylbutyrate 940 mg/g. Contains Na+ 5.4 mmol/g. Net price 266-g pack = £860.00
Note Granules should be mixed with food before taking

Homocystinuria
Betaine is licensed for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism. Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.
The Scottish Medicines Consortium (p. 4) has advised (July 2010) that betaine anhydrous (Cystadane®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

BETaine
Indications (specialist use only) adjunctive treatment of homocystinuria
Cautions monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur
Pregnancy manufacturer advises avoid unless essential—limited information available
Breast-feeding manufacturer advises caution—no information available
Side-effects less commonly gastro-intestinal disorders, anorexia, reversible cerebral oedema (see Cau-
BNF 61

Disease

Diarrhoea, flatulence, abdominal pain,

Side-effects

manufacturer advises avoid—no

Breast-feeding

Pregnancy

manufacturer advises avoid (toxicity in

Renal impairment

Hepatic impairment

Other metabolic disorders

Miglustat is available for the treatment of progressive neurological manifestations of Niemann-Pick type C disease, a neurodegenerative disorder characterised by impaired intracellular lipid trafficking; it is also licensed for the treatment of mild to moderate type 1 Gaucher’s disease for whom imiglucerase is unsuitable, see also p. 624.

MIGLUSTAT

Indications mild to moderate type I Gaucher’s disease (specialist supervision only); Niemann-Pick type C disease (specialist supervision only)

Cautions monitor cognitive and neurological function; monitor growth and platelet count in Niemann-Pick type C disease

Hepatic impairment no information available—manufacturer advises caution

Renal impairment for Gaucher’s disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m²; initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m²; for Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m²; initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m²; child under 12 years—consult product literature; avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid (toxicity in animal studies)—effective contraception must be used during treatment; also men should avoid fathering a child during and for 3 months after treatment

Breast-feeding manufacturer advises avoid—no information available

Side-effects diarrhoea, flatulence, abdominal pain, dyspepsia, constipation, nausea, vomiting, anorexia, weight changes; tremor, dizziness, headache, peripheral neuropathy, ataxia, hypoesthesia, paraesthesia, insomnia, fatigue, asthenia; decreased libido; thrombocytopenia; muscle spasm

Dose

● Gaucher’s disease, ADULT over 18 years, 100 mg 3 times daily; reduced if not tolerated to 100 mg 1–2 times daily

● Niemann-Pick type C disease, ADULT and CHILD over 12 years, 200 mg 3 times daily; CHILD 4–12 years, body surface area less than 0.47 m², 100 mg once daily; body surface area 0.47–0.73 m², 100 mg twice daily;

body surface area 0.73–0.88 m², 100 mg three times daily; body surface area 0.88–1.25 m², 200 mg twice daily; body surface area greater than 1.25 m², adult dose

Zavesca® (Actelion) Capsules, miglustat 100 mg, net price 84-cap pack = £3934.17 (hospital only)

9.8.2 Acute porphyrias

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyrin crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphoria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

Supplies of haem arginate may be obtained in an emergency outside office hours from the on-call pharmacist at:

St Thomas’ Hospital London Tel: (020) 7188 7188

HAEM ARGINATE

(Human hemin)

Indications acute porphyrias (acute intermittent porphyria, porphyria variegata, hereditary coproporphyria)

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid unless essential—no information available

Side-effects rarely hypersensitivity reactions and fever; pain and thrombophlebitis at injection site

Dose

● By intravenous infusion, ADULT and CHILD 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

Normosang® (Orphan Europe) Concentrate for Intravenous infusion, haem arginate 25 mg/mL, net price 10-mL amp = £434.25

9.8.2 Acute porphyrias

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyrin crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphoria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

Supplies of haem arginate may be obtained in an emergency outside office hours from the on-call pharmacist at:

St Thomas’ Hospital London Tel: (020) 7188 7188

HAEM ARGINATE

(Human hemin)

Breast-feeding manufacturer advises avoid unless essential—no information available

Side-effects rarely hypersensitivity reactions and fever; pain and thrombophlebitis at injection site

Dose

● By intravenous infusion, ADULT and CHILD 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

Normosang® (Orphan Europe) Concentrate for Intravenous infusion, haem arginate 25 mg/mL, net price 10-mL amp = £434.25
Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyria is available at www.wmic.wales.nhs.uk/porphyria_info.php

Unsafe Drug Groups (check first)

- Alkylating drugs
- Amfotermine
- Anabolic steroids
- Antidepressants
- Antihistamines
- Barbiturates

Unsafe Drugs (check groups above first)

- Acetofenac
- Alcohol
- Aminophylline
- Amiodarone
- Bexorotene
- Bosantan
- Bromocriptine
- Cabergoline
- Carbamazepine
- Chloral hydrate
- Chloramphenicol
- Cocaine
- Clindamycin
- Colchicine
- Cycloserine
- Danazol
- Dapsone
- Dexfenfluramine
- Diazepam
- Dilucifenac

Further information may be obtained from: www.porphyria-europe.org

and also from:
Welsh Medicines Information Centre
University Hospital of Wales
Cardiff, CF14 4XW
Tel: (029) 2074 2979/3877

Note: Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs: these should be checked first.

1. Contact Welsh Medicines Information Centre for further advice.
2. Includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, venlafaxine, and mianserin thought to be safe.
3. Alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe.
4. Includes primidone and thiopental.
5. Alkylating drugs; calcium channel blockers; non-nucleoside reverse transcriptase inhibitors; progestogens; protease inhibitors; Statins; sulfonamides.
6. Progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.
7. Includes ergometrine (oxytocin probably safe) and ergot derivatives.
8. Applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure.
9. Rosuvastatin is thought to be safe.
10. Incluedes co-trimoxazole and sulfasalazine.
11. Glipizide is thought to be safe.
12. Although evidence of hazard is uncertain, manufacturer advises avoid.
13. Small amounts in medicines probably safe.
14. Status epilepticus has been treated successfully with intravenous diazepam.
15. When used for local anaesthesia, articaine, bupivacaine, lidocaine, prilocaine, and tetracaine are thought to be safe.
16. May be used with caution if safer alternative not available.
17. Buprenorphine, codeine, damorphine, dihydrocodeine, fentanyl, methadone, morphine, pethidine, and tramadol are thought to be safe.
18. Rifamycins have been used in a few patients without evidence of harm—use with caution if safer alternative not available.
10 Musculoskeletal and joint diseases

10.1 Drugs used in rheumatic diseases and gout

10.1.1 Non-steroidal anti-inflammatory drugs
10.1.2 Corticosteroids
10.1.3 Drugs that suppress the rheumatic disease process
10.1.4 Gout and cytotoxic-induced hyperuricaemia
10.1.5 Other drugs for rheumatic diseases

10.2 Drugs used in neuromuscular disorders

10.2.1 Drugs that enhance neuromuscular transmission
10.2.2 Skeletal muscle relaxants

10.3 Drugs for the relief of soft-tissue inflammation and topical pain relief

10.3.1 Enzymes
10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices

This chapter also includes advice on the drug management of the following:
- dental and orofacial pain, p. 631
- extravasation, p. 663
- gout, p. 654
- myasthenia gravis, p. 657
- osteoarthritis and soft-tissue disorders, below
- rheumatoid arthritis and other inflammatory disorders, below

For treatment of septic arthritis see Table 1, section 5.1.

Rheumatoid arthritis and other inflammatory disorders

A non-steroidal anti-inflammatory drug (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as paracetamol or codeine can also be used. For advice on the prophylaxis and treatment of NSAID-associated gastrointestinal ulcers, see p. 50.

Drugs are also used to influence the rheumatic disease process itself (section 10.1.3). For rheumatoid arthritis these disease-modifying antirheumatic drugs (DMARDs) include methotrexate, cytokine modulators, azathioprine, ciclosporin, cyclophosphamide, leflunomide, penicillamine, gold, antimalarials (chloroquine and hydroxychloroquine), and sulfasalazine. Corticosteroids also have a significant role in the management of rheumatoid arthritis (section 10.1.2.1).

Drugs which may affect the disease process in psoriatic arthritis include sulfasalazine, gold salts, azathioprine, methotrexate, and cytokine modulators (section 10.1.3).

For long-term control of gout, uricosuric drugs and allopurinol (section 10.1.4) can be used.

Osteoarthritis and soft-tissue disorders

For pain relief in osteoarthritis and soft-tissue disorders, paracetamol (section 4.7.1) should be used first and may need to be taken regularly. A topical NSAID (section 10.3.2) or topical capsaicin 0.025% (section 10.3.2) should also be considered, particularly in knee or hand osteoarthritis. An oral NSAID (section 10.1.1) can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an opioid analgesic (section 4.7.2) may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered.
before a NSAID in patients taking low-dose aspirin. For advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see p. 50.

Intra-articular corticosteroid injections (section 10.1.2.2) may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine (section 10.1.5) and rubefacients (section 10.3.2) are not recommended for the treatment of osteoarthritis.

Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate (Duraflex®, Euflexxx®, Fematro®), Hyalgan® (Orthovisc®), Ostenil®, Suplasyne®, Synocrom®, Synovia* or bylan G-F 20 (Synvisc®) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation.

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the inflammatory arthritides (e.g. rheumatoid arthritis) and in some cases of advanced osteoarthritis. NSAIDs can also be of benefit in the less well defined conditions of back pain and soft-tissue disorders.

Choice Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastro-intestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. Doses of 1.6 to 2.4 g daily are needed for rheumatoid arthritis and it is unsuitable for conditions where inflammation is prominent, such as acute gout. Dexibuprofen is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

Naproxen is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen, see CSM comment below).

Fenbufen is claimed to be associated with less gastro-intestinal bleeding, but there is a high risk of rash (see p. 635).

Fenoprofen is as effective as naproxen, and flurbiprofen may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

Ketoprofen has anti-inflammatory properties similar to ibuprofen and has more side-effects (see also CSM advice below). Dextropropafen, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

Tiaprofenic acid is as effective as naproxen; it has more side-effects than ibuprofen (important: reports of severe cystitis, see CSM advice on p. 640).

Drugs with properties similar to those of propionic acid derivatives:

Diclofenac and aceclofenac have actions and side-effects similar to those of naproxen.

Etodolac is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

Indometacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances (see also CSM advice below).

Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Meloxicam is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

Nabumetone is comparable in effect to naproxen.

Phenytoin is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administra-
Heart disease. However, it has more gastrointestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions (important: see CHMP advice, p. 639).

Sulindac is similar in tolerance to naproxen.

Tenofovir is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolenaemic acid is licensed for the treatment of migraine (section 4.7.4.1).

Ketorolac and the selective inhibitor of cyclo-oxygenase-2, parecoxib, are licensed for the short-term management of postoperative pain (section 15.1.4.2). The selective inhibitors of cyclo-oxygenase-2, etoricoxib and celecoxib, are as effective as non-selective NSAIDs such as diclofenac and naproxen. Short-term data indicate that the risk of serious upper gastrointestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin. There are concerns about the cardiovascular safety of cyclo-oxygenase-2 selective inhibitors (see below).

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Dental and orofacial pain Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen and diclofenac.

In an appraisal of the relative safety of 7 non-selective NSAIDs, the CSM assessed ibuprofen to have the lowest risk of serious gastrointestinal side-effects (see p. 632). For further information on the management of dental and orofacial pain, see p. 257.

Cautions and contra-indications NSAIDs should be used with caution in the elderly (risk of serious side-effects and fatalities, see also Prescribing for the Elderly p. 25), in allergic disorders (they are contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID), and in coagulation defects. Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment. Caution is also required in patients with connective-tissue disorders, see Side-effects below.

In patients with cardiac impairment, caution is required since NSAIDs may impair renal function (see also Side-effects, below). All NSAIDs are contra-indicated in severe heart failure. The selective inhibitors of cyclo-oxygenase-2 (celecoxib, etoricoxib, and parecoxib) are contra-indicated in ischaemic heart disease, cerebrovascular disease, peripheral arterial disease, and moderate or severe heart failure. The selective inhibitors of cyclo-oxygenase-2 should be used with caution in patients with a history of cardiac failure, left ventricular dysfunction, hypertension, in patients with oedema for any other reason, and in patients with risk factors for heart disease.

NSAIDs and cardiovascular events Cyclo-oxygenase-2 selective inhibitors are associated with an increased risk of thrombotic events (e.g. myocardial infarction and stroke) and should not be used in preference to non-selective NSAIDs except when specifically indicated (i.e. for patients at a particularly high risk of developing gastrointestinal ulceration or bleeding) and after assessing their cardiovascular risk.

Non-selective NSAIDs are also associated with a small increased risk of thrombotic events even when used short-term in those with no cardiovascular risk factors. Diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib. Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID or cyclo-oxygenase-2 selective inhibitor should be prescribed for the shortest period to control symptoms and that the need for long-term treatment should be reviewed periodically.

The CSM has advised that non-selective NSAIDs are contra-indicated in patients with previous or active peptic ulceration and that selective inhibitors of cyclo-oxygenase-2 are contra-indicated in active peptic ulceration (see also CSM advice below). While it is preferable to avoid NSAIDs in patients with active or previous gastrointestinal ulceration or bleeding, and to withdraw them if gastrointestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness. Patients at risk of gastrointestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment; for advice on the prophylaxis and treatment of NSAID-associated gastrointestinal ulcers, see section 1.3.

For interactions of NSAIDs, see Appendix 1 (NSAIDs).

Hepatic impairment NSAIDs should be used with caution in patients with hepatic impairment; there is an increased risk of gastrointestinal bleeding and fluid retention. NSAIDs should be avoided in severe liver disease; see also individual drugs.

Renal impairment NSAIDs should be avoided if possible or used with caution in patients with renal impairment; the lowest effective dose should be used for the shortest possible duration, and renal function should be monitored. Sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure; deterioration in renal function has also been reported after topical use; see also individual drugs.

Pregnancy Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of...
labour may be delayed and its duration may be increased.

**Breast-feeding** NSAIDs should be used with caution during breast-feeding; see also individual drugs.

**Side-effects** Gastro-intestinal disturbances including discomfort, nausea, diarrhoea, and occasionally bleeding and ulceration occur (see also CSM advice below and Cautions above). Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

**Aceclofenac**

**Indications** pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** initially 100 mg daily; see also notes above

**Renal impairment** avoid in moderate to severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Dose**

- 100 mg twice daily; **CHILD** not recommended

**Acemetacin (Glycolic acid ester of indometacin)**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; postoperative analgesia

**Cautions** see under Indometacin and notes above

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see under Indometacin and notes above

**Dose**

- 120 mg daily in divided doses with food, increased if necessary to 180 mg daily; **CHILD** not recommended

**Emflex® (Merck Serono)**

**Capsules** yellow/orange, acemetacin 60 mg, net price 90-cap pack = £28.20. Label: 21, counselling, driving

**Celecoxib**

**Indications** see under preparations

**Cautions** see notes above; monitor blood pressure before treatment and during treatment; anastomatic

Hepatic damage, alveolitis, pulmonary eosinophilia, pancreatitis, visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis are other rare side-effects. Induction of or exacerbation of colitis or Crohn’s disease has been reported. Aseptic meningitis has been reported rarely with NSAIDs—patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible.
ulcer (avoid concomitant administration of anticoagulants or aspirin)

**Contra-indications** see notes above; sulphonamide sensitivity; inflammatory bowel disease

**Hepatic impairment** in pain and inflammation, halve initial dose in moderate impairment; in familial adenomatous polyposis, halve dose in moderate impairment and avoid in severe impairment; see also notes above

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²; see also notes above

**Pregnancy** avoid (teratogenic in animal studies); see also notes above

**Breast-feeding** avoid—present in milk in animal studies; see also notes above

**Side-effects** see notes above; dyspnoea, influenza-like symptoms; less commonly stomatitis, palpitation, dysphonia, cerebral infarction, fatigue, paraesthesia, lipoma, muscle cramps; rarely taste disturbance, alopecia; very rarely seizures; also reported chest pain

### Pain and inflammation

**Celebrex** (Pharmacia)

- **Capsules**
  - celecoxib 100 mg (white/blue), net price 60-cap pack = £21.55; 200 mg (white/gold), 30-cap pack = £21.55
- **Dose**
  - osteoarthritis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 200 mg twice daily; **CHILD** not recommended
  - Rheumatoid arthritis, 100 mg twice daily, increased if necessary to 200 mg twice daily; **CHILD** not recommended

### Familial adenomatous polyposis

**Onsenal** (Pharmacia)

- **Capsules**
  - celecoxib 400 mg, net price 60-cap pack = £86.20; Label: 21
- **Dose**
  - familial adenomatous polyposis, **ADULT** over 18 years, 400 mg twice daily

### DEXIBUPROFEN

**Indications** pain and inflammation associated with osteoarthritis and other musculoskeletal disorders; mild to moderate pain and inflammation including dysmenorrhoea and dental pain

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** reduce initial dose; avoid if eGFR less than 30 mL/minute/1.73 m²: see also notes above

**Pregnancy** see notes above

**Breast-feeding** avoid—present in milk too small to be harmful; see also notes above

**Side-effects** see notes above

**Dose**

- 600–900 mg daily in up to 3 divided doses; increased if necessary to max. 1.2 g daily (900 mg daily for dysmenorrhoea); max. single dose 400 mg (300 mg for dysmenorrhoea); **CHILD** not recommended

**Seractil** (Genus)

- **Tablets**
  - f/c, dexibuprofen 300 mg, net price 60-tab pack = £9.47; 400 mg (scored) 60-tab pack = £9.47. Label: 21

### DEXKETOPROFEN

**Indications** short-term treatment of mild to moderate pain including dysmenorrhoea

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** reduce initial dose to max. 50 mg daily; avoid in moderate to severe impairment; see also notes above

**Renal impairment** reduce initial dose to 50 mg daily; avoid in moderate to severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid—no information available; see also notes above

**Side-effects** see notes above

**Dose**

- 12.5 mg every 4–6 hours or 25 mg every 8 hours; max. 75 mg daily; **ELDERLY** initially max. 50 mg daily; **CHILD** not recommended

### DICLOFENAC POTASSIUM

**Indications** pain and inflammation in rheumatoid disease and other musculoskeletal disorders; acute gout; postoperative pain; migraine

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount in milk too small to be harmful; see also notes above

**Side-effects** see notes above

**Dose**

- Rheumatic disease, musculoskeletal disorders, acute gout, postoperative pain, 75–150 mg daily in 2–3 divided doses; **CHILD** over 14 years, 75–100 mg daily in 2–3 divided doses
- Migraine, 50 mg at onset, repeated after 2 hours if necessary then after 4–6 hours; max. 200 mg in 24 hours; **CHILD** not recommended

**Diclofenac Potassium** (Non-proprietary)

- **Tablets**

**Voltarol** Rapid (Novartis)

- **Tablets**
  - s/c, diclofenac potassium 25 mg (red), net price 30-tab pack = £3.46; 50 mg (brown), 30-tab pack = £6.62. Label: 21

1. 12.5 mg tablets can be sold to the public for the treatment of headache, dental pain, period pain, rheumatic and muscular pain, backache and the symptoms of cold and flu (including fever), in patients aged over 14 years subject to max. single dose of 25 mg, max. daily dose of 75 mg for max. 3 days, and max. pack size of 18 × 12.5 mg
DICLOFENAC SODIUM

**Indications** pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; acute gout; postoperative pain

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Intravenous use** Additional contra-indications include concomitant NSAID or anticoagulant use (including low-dose heparin), history of haemorrhagic diathesis, history of confirmed or suspected cerebrovascular bleeding, operations with high risk of haemorrhage, history of asthma, moderate or severe renal impairment (see also Renal impairment below), hypovolaemia, dehydration.

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; avoid intravenous use if serum creatinine greater than 160 micromol/litre; see also notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Pseudoephedrine** see notes above

**Side-effects**

- Breast-feeding

**Dose**

- By mouth, 75–150 mg daily in 2–3 divided doses
- By rectum in suppositories, 75–150 mg daily in divided doses
- By intravenous injection, 2 mg/kg (max. 150 mg) daily in divided doses
- By deep intramuscular injection, 75 SR mg 1–2 times daily preferably with food; max. 150 mg in 24 hours for 2 days
- By intramuscular injection into the gluteal muscle, 75 mg then a further 75 mg after 30 minutes if necessary
- By intravenous infusion (in hospital setting), acute postoperative pain, 75 mg repeated if necessary after 4–6 hours; max. 150 mg in 24 hours for 2 days
- By intravenous injection in supervised healthcare settings, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days; CHILD 2–18 years, see BNF for Children
- By intravenous injection, diclofenac sodium 25 mg/mL, net price 3–ML amp = 83p

**Excipients**

- Include benzyl alcohol (avoid in neonates unless there is no safer alternative, see Excipients, p. 2), propylene glycol

**Special precautions**

- Do not exceed dose for 2 days
- Dose by deep intramuscular injection into the gluteal muscle
- See also Renal impairment (section 9.8.2) and Hepatic impairment
- Avoid injections containing benzyl alcohol in neonates
- Avoid injections and suppositories containing benzyl alcohol in neonates (see preparations below)
- Avoid injections in neonates
- Avoid injections in neonates

**Notes**

- Voltarol Dispersible tablets are more suitable for short-term use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months)
- Voltarol, diclofenac sodium 12.5 mg, net price 10 = £5.86; 25 mg, 10 = £1.03; 50 mg, 10 = £1.70; 100 mg, 10 = £3.03

**Modified release**

**Diclomax SR** (Galen) Capsules, m/r, yellow, diclofenac sodium 75 mg, net price 56-cap pack = £11.40. Label: 21, 25

**Dose** 1 capsule 1–2 times daily or 2 capsules once daily, preferably with food; CHILD not recommended

**Diclomax Retard** (Galen) Capsules, m/r, diclofenac sodium 100 mg, net price 28-cap pack = £8.20. Label: 21, 25

**Dose** 1 capsule daily preferably with food, CHILD not recommended

**Motifene** 75 mg (Daichi Sankyo) Capsules, e/c, m/r, diclofenac sodium 75 mg (enclosing e/c pellets containing diclofenac sodium 25 mg and m/r pellets containing diclofenac sodium 50 mg), net price 56-cap pack = £8.00. Label: 25

**Dose** 1 capsule 1–2 times daily; CHILD not recommended

**Voltarol** 75 mg SR (Novartis) Tablets, m/r, f/c, pink, diclofenac sodium 75 mg, net price 28-tab pack = £6.46; 56-tab pack = £12.92. Label: 21, 25

**Dose** 75 mg 1–2 times daily preferably with food; CHILD not recommended

**Note** Other brands of modified-release tablets containing diclofenac sodium 75 mg include Defenac®, SR, Desamox®, 75 SR, Deflex®, 75 SR, Fenactol®, SR, Flexotard®, MR 75, Rheumatac®, Retard 75, Rhumalgan® CR, Slofenac® SR, Volaid® Retard 75

**Voltarol Retard** (Novartis) Tablets, m/r, f/c, red, diclofenac sodium 100 mg. Net price 28-tab pack = £9.47. Label: 21, 25

**Dose** 1 tablet daily preferably with food; CHILD not recommended

**Note** Other brands of modified-release tablets containing diclofenac sodium 100 mg include Defenac® Retard, Desamox® Retard 100, Deflex® Retard, Fenactol® Retard 100 mg, Flamatac®, 100 MR, Flamara® SR, Rhumalgan® CR, Slofenac® SR, Volaid® Retard 100
With misoprostol

For prescribing information on misoprostol, see section 1.3.4

Arthrotec® (Pharmacia).  

Arthrotec® 50 tablets, diclofenac sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98; Label: 21, 25  

Dose prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet 2–3 times daily with food. CHILD not recommended

Arthrotec® 75 tablets, diclofenac sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83; Label: 21, 25  

Dose prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food. CHILD not recommended

Note The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by Arthrotec® (see section 1.3.4)

Topical preparations  
Section 10.3.2

ETODOLAC

Indications pain and inflammation in rheumatoid arthritis and osteoarthritis  

Cautions see notes above  

Contra-indications see notes above  

Hepatic impairment see notes above  

Renal impairment avoid in severe impairment; see also notes above  

Pregnancy see notes above  

Breast-feeding manufacturer advises avoid; see also notes above  

Side-effects see notes above; also stomatitis, vasculitis, palpitation, fatigue, paraesthesia, tremor, urinary frequency, dysuria, pyrexia, and pruritus  

Dose  

ADULT over 18 years, 600 mg daily in 1–2 divided doses  

Etodolac (Non-proprietary)  

Tablets, m/r, f/c, grey, etodolac 600 mg, net price 30-tab pack = £8.14  

Brands include Eccoxolac®

Modified release  

Etopan XL® (Taro)  

Tablets, m/r, f/c, grey, etoricoxib 600 mg, net price 30-tab pack = £14.60. Label: 25  

Dose 1 tablet daily; CHILD not recommended  

Lodine SR® (Almirall)  

Tablets, m/r, f/c, light-grey, etoricoxib 600 mg, net price 30-tab pack = £15.50. Label: 25  

Dose 1 tablet daily; CHILD not recommended

Osteoarthritis and other musculoskeletal disorders

ETORICOXIB

Indications pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; acute gout  

Cautions see notes above; also dehydration; monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment  

Contra-indications see notes above; inflammatory bowel disease; uncontrolled hypertension (persistently above 140/90 mmHg)  

Hepatic impairment max. 60 mg daily in mild impairment; max. 60 mg on alternate days or 30 mg once daily in moderate impairment; see also notes above  

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²; see also notes above  

Pregnancy manufacturer advises avoid (teratogenic in animal studies); see also notes above  

Breast-feeding manufacturer advises avoid—present in milk in animal studies; see also notes above  

Side-effects see notes above; also palpitation, fatigue, influenza-like symptoms, ecchymosis; less commonly dry mouth, taste disturbance, mouth ulcer, appetite and weight change, atrial fibrillation, transient ischaemic attack, chest pain, flushing, cough, dyspnoea, epistaxis, anxiety, mental acuity impaired, paraesthesia, electrolyte disturbance, myalgia and arthralgia; very rarely confusion and hallucinations  

Dose  

Osteoarthritis, ADULT and CHILD over 16 years, 30 mg once daily, increased if necessary to 60 mg once daily  

Rheumatoid arthritis and ankylosing spondylitis, ADULT and CHILD over 16 years, 90 mg once daily  

Acute gout, ADULT and CHILD over 16 years, 120 mg once daily for max. 8 days  

Arcoxia® (MSD)  

Tablets, f/c, etoricoxib 30 mg (blue-green), net price 28-tab pack = £13.99; 60 mg (dark green), 28-tab pack = £20.11; 90 mg (white), 28-tab pack = £22.96; 120 mg (pale green), 7-tab pack = £6.03, 28-tab pack = £24.11

FENBUFEN

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders  

Cautions see notes above  

Contra-indications see notes above  

Hepatic impairment see notes above  

Renal impairment see notes above  

Pregnancy see notes above  

Breast-feeding small amount present in milk—manufacturer advises avoid; see also notes above  

Side-effects see notes above, but also high risk of rashes especially in seronegative rheumatoid arthritis, psoriatic arthritis and in women (discontinue immediately); also allergic interstitial lung disorders (may follow rashes)  

Dose  

300 mg in the morning and 600 mg at bed-time or 450 mg twice daily; CHILD under 14 years not recommended  

Fenbufen (Non-proprietary)  

Tablets, fenbufen 300 mg, net price 84-cap pack = £20.71. Label: 21  

Tablets, fenbufen 300 mg, net price 84-tab pack = £6.00; 450 mg, 56-tab pack = £6.49. Label: 21

FENOPROFEN

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain
10.1.1 Non-steroidal anti-inflammatory drugs

BNF 61

Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding amount too small to be harmful; see also notes above
Side-effects see notes above; upper respiratory-tract infection, nasopharyngitis, and cystitis also reported

**Dose**
- 300–600 mg 3–4 times daily with food; max. 3 g daily; CHILD not recommended

**Flurbiprofen**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain including dysmenorrhea; migraine; postoperative analgesia; sore throat (section 12.3.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but some manufacturers advise avoid (including topical use); see also notes above

**Side-effects** see notes above

**Dose**
- **ADULT** and **CHILD** over 12 years, initially 300–400 mg 3–4 times daily; increased if necessary to max. 2.4 g daily; maintenance dose of 0.6–1.2 g daily may be adequate
- Pain and fever in children, **CHILD** 1–3 months, see **BNF for Children**; **CHILD** 3–6 months (body-weight over 5 kg), 50 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 6 months–1 year, 50 mg 3–4 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 1–4 years, 100 mg 3 times daily (max. 30 mg/kg/day in 3–4 divided doses); **CHILD** 4–7 years, 150 mg 3 times daily (max. 30 mg/kg/day in 3–4 divided doses); **CHILD** 7–10 years, 200 mg 3 times daily (up to 30 mg/kg/day (max. 2.4 g) in 3–4 divided doses); **CHILD** 10–12 years, 300 mg 3 times daily (up to 30 mg/kg/day (max. 2.4 g) in 3–4 divided doses)
- Rheumatic disease in children (including juvenile idiopathic arthritis), **CHILD** 3 months–18 years (body-weight over 5 kg), 30–40 mg/kg (max. 2.4 g) daily in 3–4 divided doses; in systemic juvenile idiopathic arthritis up to 60 mg/kg (max. 2.4 g) daily [unlicensed] in 4–6 divided doses

** Ibuprofen (Non-proprietary) **

**Tablets**, coated, ibuprofen 200 mg, net price 84-tab pack = £1.62; 400 mg, 84-tab pack = £1.72; 600 mg, 84-tab pack = £4.06. Label: 21
Brands include *Arthrofen®, Ebubium®, Ringaine®*
Dental prescribing on NHS *Ibuprofen Tablets may be prescribed*
**Oral suspension**, ibuprofen 100 mg/5 mL, net price 100 mL = £1.48, 150 mL = £2.71, 500 mL = £8.98. Label: 21
Note *Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription*
Brands include *Calprofen®, Feveron®, Nurofen® for Children, Orbifene® for Children*
Dental prescribing on NHS *Ibuprofen Oral Suspension Sugar-free may be prescribed*
1. Can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice, No. 34*, London, Pharmaceutical Press, 2010 (and subsequent editions as available)

**Brufen Retard® (Abbott)**

**Tablets**, m/r, ibuprofen 800 mg, net price 56-tab pack = £6.48. Label: 25, 27
Dose **ADULT** and **CHILD** over 12 years, 2 tablets daily as a single dose, preferably in the early evening, increased in severe cases to 3 tablets daily in 2 divided doses
**Fenbid®** (Goldshield) = capsule m/r, maroon/pink, enclosing off-white pellets, ibuprofen 300 mg, net price 120-cap pack = £9.64. Label: 25

**Dose** ADULT and CHILD over 12 years, initially 2 capsules twice daily, increased in severe cases to 3 capsules twice daily; then 1–2 capsules twice daily

#### Topical preparations

Section 10.3.2

**INDOMETACIN** (Indomethacin)

**Indications** pain and moderate to severe inflammation in rheumatic disease and other acute musculoskeletal disorders; acute gout; dysmenorrhoea; premature labour (section 7.1.3)

**Cautions** see notes above; also epilepsy, parkinsonism, psychiatric disturbances; during prolonged therapy ophthalmic and blood examinations particularly advisable; avoid rectal administration in proctitis and haemorrhoids

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful but manufacturer advises avoid unless essential; see also notes above

**Side-effects** see notes above; pain may occur at injection site (occasionally tissue damage); suppositories may cause rectal irritation

**Dose**

- **By mouth**, rheumatic disease, 50–200 mg daily in divided doses; **CHILD** see BNF for Children
- Acute gout, 150–200 mg daily in divided doses
- **By rectum** in suppositories, rheumatic disease, 100 mg at bedtime; **CHILD** not recommended
- Combined oral and rectal treatment, max. total daily dose 200 mg
- **By deep intramuscular injection** into the gluteal muscle, 50–100 mg every 4 hours (max. 200 mg in 24 hours) for up to 3 days; **CHILD** not recommended

**Ketoprofen** (Non-proprietary) =

**Capsules**, ketoprofen 50 mg, net price 28-cap pack = £9.32; 100 mg, 56-cap pack = £6.66. Label: 21

**Orudis®** (Sanofi-Aventis) =

**Capsules**, ketoprofen 50 mg (green/purple), net price 112-cap pack = £15.14; 100 mg (pink), 56-cap pack = £15.49. Label: 21

**Suppositories**, ketoprofen 100 mg. Net price 10 = £6.65

**Oruvail®** (Sanofi-Aventis) =

**Injection**, ketoprofen 50 mg /mL. Net price 2-mL amp = £1.07

**Modified release**

**Oruvail®** (Sanofi-Aventis)

**Capsules**, m/r, enclosing white pellets, ketoprofen 100 mg (pink/purple), net price 56-cap pack = £23.93; 150 mg (pink), 28-cap pack = £13.66; 200 mg (pink/white), 28-cap pack = £23.85. Label: 21, 25

**Dose** 100–200 mg once daily with food; **CHILD** not recommended

**Note** Other brands of modified-release capsules containing ketoprofen 100 mg and 200 mg include Ketocid® 200 mg, Ketorol®.

**Tiloket® CR**

**With omeprazole**

For prescribing information on omeprazole, see section 1.3.5

**Axorid®** (Meda)

**Capsules**, m/r, ketoprofen 100 mg, omeprazole 20 mg (yellow/white), net price 30-cap pack = £13.80; ketoprofen 200 mg, omeprazole 20 mg (white), 30-cap pack = £13.80. Label: 21, 25

**Excipients** include propylene glycol (see Excipients, p. 2)

**Note** Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole

**Dose** (expressed as ketoprofen) patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer or gastroduodenal erosions, **ADULT** and **CHILD** over 15 years, 100 mg (with omeprazole 20 mg) once daily increased to 200 mg (with omeprazole 20 mg) once daily depending on severity of symptoms

#### Topical preparations

Section 10.3.2

**KETOPROFEN**

**Indications** pain and mild inflammation in rheumatic disease and other musculoskeletal disorders, and after orthopaedic surgery; acute gout; dysmenorrhoea

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful but manufacturer advises avoid unless essential; see also notes above

**Side-effects** see notes above; pain may occur at injection site (occasionally tissue damage); suppositories may cause rectal irritation

**Dose**

- **By mouth**, rheumatic disease, 100–200 mg daily in 2–4 divided doses; **CHILD** not recommended
- Pain and dysmenorrhoea, 50 mg up to 3 times daily; **CHILD** not recommended
- **By rectum** in suppositories, rheumatic disease, 100 mg at bedtime; **CHILD** not recommended
- Combined oral and rectal treatment, max. total daily dose 200 mg
- **By deep intramuscular injection** into the gluteal muscle, 50–100 mg every 4 hours (max. 200 mg in 24 hours) for up to 3 days; **CHILD** not recommended

**Topical preparations**

Section 10.3.2
Mefenamic Acid

**Indications**  pain and inflammation in rheumatoid arthritis and osteoarthritis; postoperative pain; mild to moderate pain; dysmenorrhoea and menorrhagia

**Cautions**  see notes above; epilepsy; acute porphyria (section 9.8.2)

**Contra-indications**  see notes above; inflammatory bowel disease

**Hepatic impairment**  see notes above

**Renal impairment**  avoid in severe impairment; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects**  see notes above; also diarrhoea or rashes (withdrawal treatment), stomatitis; less commonly: hypotension, palpitation, glucose intolerance, thrombocytopenia, haemolytic anaemia (positive Coombs’ test), and aplastic anaemia

**Dose**
- **ADULT** over 18 years, 500 mg 3 times daily
- **CHILD** 12–18 years, acute pain including dysmenorrhoea, menorrhagia, 500 mg 3 times daily

**Mefenamic Acid** (Non-proprietary) (Trade)

**Capsules**, mefenamic acid 250 mg, net price 100-cap pack = £2.83. Label: 21

**Tablets**, mefenamic acid 500 mg, net price 28-tab pack = £2.20. Label: 21

**Suspension**, mefenamic acid 50 mg/5 mL, net price 125 mL = £79.98. Label: 21

**Excipients** include ethanol

**Ponstan**® (Chemidex) (Trade)

**Capsules**, blue/ivory, mefenamic acid 250 mg, net price 100-cap pack = £8.17. Label: 21

**Forte tablets**, yellow, mefenamic acid 500 mg, net price 100-tab pack = £15.72. Label: 21

Meloxicam

**Indications**  pain and inflammation in rheumatic disease, exacerbation of osteoarthritis (short-term); ankylosing spondylitis

**Cautions**  see notes above; avoid rectal administration in proctitis or haemorrhoids

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  avoid if eGFR less than 25 mL/minute/1.73 m²; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  present in milk in animal studies—manufacturer advises avoid; see also notes above

**Side-effects**  see notes above

**Dose**
- **ADULT** over 16 years, 7.5 mg once daily; increased if necessary to max. 15 mg once daily
- **CHILD** over 16 years, 15 mg once daily; may be reduced to 7.5 mg once daily; **ELDERLY** 7.5 mg daily
- **By rectum**, in suppositories, rheumatoid arthritis, ankylosing spondylitis, **ADULT** and **CHILD** over 16 years, 15 mg once daily; may be reduced to 7.5 mg once daily; **ELDERLY** 7.5 mg once daily [but Mobic® 7.5 mg suppositories discontinued]

**Meloxicam** (Non-proprietary) (Trade)

**Tablets**, meloxicam 7.5 mg, net price 30-tab pack = £1.36; 15 mg, 30-tab pack = £1.62. Label: 21

**Mobic**® (Boehringer Ingelheim) (Trade)

**Tablets**, yellow, scored, meloxicam 7.5 mg, net price 30-tab pack = £9.30; 15 mg, 30-tab pack = £12.93. Label: 21

**Note**  Tablets may be dispersed in water

**Suppositories**, meloxicam 15 mg, net price 12 = £5.58

Nabumetone

**Indications**  pain and inflammation in osteoarthritis and rheumatoid arthritis

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  avoid in severe impairment; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  manufacturer advises avoid; see also notes above

**Side-effects**  see notes above

**Dose**
- **CHILD** over 12 years, see BNF for Children

**Meloxicam (Non-proprietary)** (Trade)

**Tablets**, meloxicam 7.5 mg, net price 30-tab pack = £1.36; 15 mg, 30-tab pack = £1.62. Label: 21

**Mobic**® (Boehringer Ingelheim) (Trade)

**Tablets**, yellow, scored, meloxicam 7.5 mg, net price 30-tab pack = £9.30; 15 mg, 30-tab pack = £12.93. Label: 21

**Note**  Tablets may be dispersed in water

**Suppositories**, meloxicam 15 mg, net price 12 = £5.58

Naproxen

**Indications**  pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; dysmenorrhoea; acute gout

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  avoid if eGFR less than 30 mL/minute/1.73 m²; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects**  see notes above

**Dose**
- **Rheumatic disease**, 0.5–1 g daily in 1–2 divided doses; **CHILD** 2–18 years, juvenile idiopathic arthritis, see BNF for Children
- **Acute musculoskeletal disorders and dysmenorrhoea**, 500 mg initially, then 250 mg every 6–8 hours as required; max. dose after first day 1.25 g daily; **CHILD** under 18 years, see BNF for Children
- **Acute gout**, 750 mg initially, then 250 mg every 8 hours until attack has passed; **CHILD** under 18 years not recommended

**Note**  Tablets, meloxicam 7.5 mg, net price 30-tab pack = £1.36; 15 mg, 30-tab pack = £1.62. Label: 21

**Mobic**® (Boehringer Ingelheim) (Trade)

**Tablets**, yellow, scored, meloxicam 7.5 mg, net price 30-tab pack = £9.30; 15 mg, 30-tab pack = £12.93. Label: 21

**Note**  Tablets may be dispersed in water

**Suppositories**, meloxicam 15 mg, net price 12 = £5.58
1Naproxen (Non-proprietary) (AstraZeneca) (Roche) (Pharmacia)
Tablets, yellow, scored, naproxen 250 mg, net price 56-tab pack = £4.29; 500 mg, 56-tab pack = £8.56.
Tablets, e/c, naproxen 250 mg, net price 56-tab pack = £6.18; 375 mg, 56-tab pack = £6.72; 500 mg, 56-tab pack = £10.68.
Tablets, f/c, naproxen 500 mg, net price 56-tab pack = £11.17; 1000 mg, 56-tab pack = £27.41.
Tablets, Naprosyn EC (Roche), naproxen 500 mg, net price 56-tab pack = £18.95.
Tablets, Napratec, naproxen 500 mg, net price 56-tab pack = £23.82; 1000 mg, 56-tab pack = £56.24.
Tablets, Naproxen (proprietary), naproxen 500 mg, net price 56-tab pack = £24.33; 1000 mg, 56-tab pack = £56.45.
Tablets, Synflex, naproxen 250 mg, net price 56-tab pack = £4.83; 375 mg, 56-tab pack = £26.82; 500 mg, 56-tab pack = £50.76.
Tablets, Arthroxen, naproxen 250 mg, net price 28-tab pack = £1.35; 500 mg, 28-tab pack = £1.72. Label: 21
Tablets, Naprosyn EC, naproxen 500 mg, net price 56-tab pack = £4.29; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £8.56. Label: 5, 25
Tablets, Naprosyn, naproxen 500 mg, net price 60-tab pack = £7.10. Label: 21
Note 275 mg naproxen sodium = 250 mg naproxen
Dose musculoskeletal disorders, postoperative analgesia, 550 mg twice daily when necessary, preferably after food, max. 1 g daily. CHILD under 16 years not recommended
Dysmenorrhea and acute gout, initially 550 mg then 275 mg every 6–8 hours as required; max. of 1.375 g on first day and 1.1 g daily thereafter; CHILD under 16 years not recommended
Migraine, 825 mg at onset, then 275–550 mg at least 30 minutes daily thereafter; every 6–8 hours as required; max. of 1.375 g on first day and 1.1 g daily thereafter; CHILD under 16 years not recommended
Parkinson’s disease, initially 260 mg then 130 mg every 6–8 hours as required; max. of 1.375 g on first day and 1.1 g daily thereafter; CHILD under 16 years not recommended
Dysmenorrhoea in women aged 15–50 years subject to max. 1.375 g on first day and 1.1 g daily thereafter; CHILD under 16 years not recommended
CHILD 6–18 years, juvenile idiopathic arthritis, see BNF for Children
Topical preparations containing piroxicam are not affected by these restrictions

PREGNANCY see notes above
Breast-feeding amount too small to be harmful; see also notes above
Side-effects see notes above

Piroxicam (Non-proprietary) (Pharmacia) (AstraZeneca) (Roche) (Chiesi)
Capsules, piroxicam 10 mg, net price 56-cap pack = £16.62; 20 mg, 28-cap pack = £32.41. Label: 21
Dispersible tablets, piroxicam 10 mg, net price 56-tab pack = £9.96; 20 mg, 28-tab pack = £19.92. Label: 13, 21
Brexidol (Chiesi) (AstraZeneca) (Roche)
Tablets, yellow, scored, piroxicam (as magnesium trihydrate) 20 mg, net price 60-tab pack = £14.95. Label: 22, 25
Note Naproxen component is gastro-resistant
Dose patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankyllosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs ineffective, ADULT over 18 years, 1 tablet daily
CHILD under 18 years not recommended

PIROXICAM

Indications rheumatoid arthritis, osteoarthritis, and ankyllosing spondylitis (see also CHMP advice below)
Cautions see notes above and CHMP advice below
Contra-indications inflammatory bowel disease; see also notes above
Hepatic impairment see notes above
Renal impairment see notes above

Pregnancy see notes above

CHMP advice
Piroxicam (June 2007) The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:
• piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
• piroxicam should not be used as first-line treatment
• in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankyllosing spondylitis
• piroxicam dose should not exceed 20 mg daily
• piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
• treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
• concomitant administration of a gastro-protective agent (section 1.3) should be considered
Note Topical preparations containing piroxicam are not affected by these restrictions

Piroxicam (Non-proprietary) (Pharmacia) (Roche) (AstraZeneca) (Chiesi)
Capsules, piroxicam 10 mg, net price 56-cap pack = £16.62; 20 mg, 28-cap pack = £32.41. Label: 21
Dispersible tablets, piroxicam 10 mg, net price 56-tab pack = £9.96; 20 mg, 28-tab pack = £19.92. Label: 13, 21
Brexidol (Chiesi) (AstraZeneca) (Roche)
Tablets, yellow, scored, piroxicam (as magnesium trihydrate) 20 mg, net price 60-tab pack = £14.95. Label: 22, 25
Note Naproxen component is gastro-resistant
Dose musculoskeletal disorders, postoperative analgesia, 550 mg twice daily when necessary, preferably after food, max. 1 g daily. CHILD under 16 years not recommended
Dysmenorrhea and acute gout, initially 550 mg then 275 mg every 6–8 hours as required; max. of 1.375 g on first day and 1.1 g daily thereafter; CHILD under 16 years not recommended
Migraine, 825 mg at onset, then 275–550 mg at least 30 minutes after initial dose; max. 1.375 g in 24 hours. CHILD under 16 years not recommended

With esomeprazole
For prescribing information on esomeprazole, see section 3.5
Vimovo (AstraZeneca) (Roche) (Chiesi)
Tablets, f/c, m/r, naproxen 500 mg, esomeprazole (as magnesium trihydrate) 20 mg, net price 60-tab pack = £14.95. Label: 22, 25
Note Naproxen component is gastro-resistant
Dose patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankyllosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs ineffective, ADULT over 18 years, 1 tablet daily
CHILD under 18 years not recommended

With misoprostol
For prescribing information on misoprostol, see section 3.4
Naprapac (Pharmacia) (Pharmacia)
Combination pack, 56 yellow scored tablets, naproxen 500 mg; 56 white scored tablets, misoprostol 200 micrograms. Net price = £23.76. Label: 21
Dose patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankyllosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration, 1 naproxen 500-mg tablet and 1 misoprostol 200-microgram tablet taken together twice daily with food. CHILD not recommended
Note The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by Naprapac® (see section 3.4)

10Musculoskeletal and joint diseases

SULINDAC

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout
Cautions see notes above; also history of renal stones and ensure adequate hydration
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment avoid in severe impairment; see also notes above
Pregnancy see notes above
**10.1.2 Corticosteroids**

**Aspirin**

Aspirin (section 4.7.1) has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

**10.1.2.1 Systemic corticosteroids**

The general actions, uses, and cautions of corticosteroids are described in section 6.3. Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment (section 6.6).

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

**Prednisolone**

7.5 mg daily may reduce the rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years' duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of prednisone (section 6.3.2) is also available for the treatment of moderate to severe rheumatoid arthritis.

**Polymyalgia rheumatica** and giant cell (temporal) arteritis are always treated with corticosteroids. The usual initial dose of prednisolone in polymyalgia rheumatica is 10–15 mg daily and in giant cell arteritis 40–60 mg daily (the higher dose being used if visual symp-
Intra-articular/Intradermal

**Local corticosteroid injections**

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by *intra-articular injection* to relieve pain, increase mobility, and reduce deformity in one or a few joints. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neuropathies. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should usually be treated no more than 3 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions (see section 13.4).

**LOCAL CORTICOSTEROID INJECTIONS**

**Indications**  local inflammation of joints and soft tissues (for details, consult product literature)

**Cautions**  see notes above and consult product literature; see also section 6.3.2

**Contra-indications**  see notes above and consult product literature; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Side-effects**  see notes above and consult product literature

**Dose**

- See under preparations

- **Betamethasone**

  Betnesol® (UCB Pharma)  
  Injection, betamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.17.

- **Dexamethasone**

  Dexamethasone (Non-proprietary)  
  Injection, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.27  
  **Dose** by *intra-articular injection* (for details consult product literature), 0.3–3 mg according to size, where appropriate may be repeated at intervals of 3–21 days according to response

  Injection, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.00, 2-mL vial = £1.98  
  **Dose** by *intra-articular injection* (for details consult product literature), 0.33–3 mg according to size (*by soft-tissue infiltration* 1.7–5 mg), where appropriate may be repeated at intervals of 3–21 days

- **Hydrocortisone acetate**

  Hydrocortistab® (Sovereign)  
  Injection (aqueous suspension), hydrocortisone acetate 25 mg/mL, net price 1-mL amp = £5.72  
  **Dose** by *intra-articular injection* (for details consult product literature), 5–25 mg according to size; not more than 3 joints should be treated on any one day; *CHILD* 5–30 mg (divided)

- **Methylprednisolone acetate**

  Depo-Medrone® (Pharmacia)  
  Injection (aqueous suspension), methylprednisolone acetate 40 mg/mL, net price 1-mL vial = £2.87, 2-mL vial = £5.15; 3-mL vial = £7.47  
  **Dose** by *intra-articular injection* (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days; also for *intrathecal injection*

  Depo-Medrone® with Lidocaine (Pharmacia)  
  Injection (aqueous suspension), methylprednisolone acetate 40 mg, lidocaine hydrochloride 10 mg/mL, net price 1-mL vial = £3.28; 2-mL vial = £5.88  
  **Dose** by *intra-articular injection* (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days

- **Prednisolone acetate**

  Deltas-tab® (Sovereign)  
  Injection (aqueous suspension), prednisolone acetate 25 mg/mL, net price 1-mL amp = £5.73  
  **Dose** by *intra-articular injection* (for details consult product literature), 5–25 mg according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs

  For *intramuscular injection*, see section 6.3.2

- **Triamcinolone acetonide**

  Adcortyl® *Intra-articular/Intradermal* (Squibb)  
  Injection (aqueous suspension), triamcinolone acetonide 10 mg/mL, net price 1-mL amp = 90p; 5-mL vial = £3.63  
  **Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 1)

  **Dose** by *intra-articular injection* (for details consult product literature), 2.5–15 mg according to size (for larger doses use...
10.1.3 Drugs that suppress the rheumatic disease process

Certain drugs such as those affecting the immune response can suppress the disease process in rheumatoid arthritis and psoriatic arthritis; gold, penicillamine, hydroxychloroquine, chloroquine, and sulfasalazine can also suppress the disease process in rheumatoid arthritis while sulfasalazine and possibly gold can suppress the disease process in psoriatic arthritis. Unlike NSAIDs, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Since in the first few months of treatment, the course of rheumatoid arthritis is unpredictable and the diagnosis uncertain, it is usual to start treatment with an NSAID alone. However, disease-modifying anti-rheumatic drugs should be initiated by specialists as soon as diagnosis, progression, and severity of the disease have been confirmed. Response to a disease-modifying anti-rheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying anti-rheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations such as vasculitis. They reduce the erythrocyte sedimentation rate, C-reactive protein, and sometimes the titre of rheumatoid factor; some also retard erosive damage as judged radiologically.

Choice

The choice of a disease-modifying anti-rheumatic drug should take into account co-morbidity and patient preference. Methotrexate, sulfasalazine, intramuscular gold, and penicillamine are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

A combination of DMARDs (including methotrexate and at least one other DMARD) and a short-term corticosteroid (section 10.1.2), should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms if the use of particular DMARDs is contra-indicated and combination therapy is not possible. Monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

Gold and penicillamine are effective in palindromic rheumatism. Systemic and discoid lupus erythematosus are sometimes treated with chloroquine or hydroxychloroquine.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

Juvenile idiopathic arthritis

Many children with juvenile idiopathic arthritis (juvenile chronic arthritis) do not require disease-modifying anti-rheumatic drugs.

Methotrexate is effective [unlicensed indication]; sulfasalazine is an alternative [unlicensed indication] but it should be avoided in systemic-onset juvenile idiopathic arthritis. Gold and penicillamine are no longer used. For the role of cytokine modulators in polyarticular juvenile idiopathic arthritis, see p. 647.

Gold

Gold can be given as sodium aurothiomalate for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose of 10 mg must be given followed by doses of 50 mg at weekly intervals until there is definite evidence of remission. Benefit is not to be expected until about 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased to 50 mg weekly and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre. Urine tests and full blood counts (including total and differential white cell and platelet counts) must therefore be performed before starting treatment and before each intramuscular injection. Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

SODIUM AUROTHIOMALATE

Indications active progressive rheumatoid arthritis

Cautions see notes above; elderly, history of urticaria, eczema, colitis; monitor for pulmonary fibrosis with annual chest X-ray; interactions: Appendix 1 (sodium aurothiomalate)

Counselling Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop

Contra-indications history of blood disorders or bone marrow aplasia, exfoliative dermatitis, systemic lupus erythematosus, necrotising enterocolitis, pulmonary fibrosis, acute porphyria (section 9.8.2)

Hepatic impairment caution in mild to moderate impairment, avoid in severe impairment
Penicillamine

Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase). A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase. Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued provided that renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.

Nausea may occur but is not usually a problem provided that penicillamine is taken before food or on retiring and that low initial doses are used and only gradually increased. Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued; mineral supplements are not recommended. Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased. Late rashes are more resistant and often necessitate discontinuation of treatment.

Patients who are hypersensitive to penicillin may react rarely to penicillamine.
Antimalarials

The antimalarial hydroxychloroquine is used to treat rheumatoid arthritis of moderate inflammatory activity; chloroquine is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed. Chloroquine and hydroxychloroquine are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis.

Chloroquine and hydroxychloroquine are better tolerated than gold or penicillamine. Retinopathy (see below) rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine (section 5.4.4) is sometimes used in discoid drug-induced retinopathy from changes of ageing.

Cautions Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists, below). Chloroquine and hydroxychloroquine should be used with caution in neurological disorders (especially in those with a history of epilepsy), in severe gastro-intestinal disorders, in G6PD deficiency (section 9.1.5), in acute porphyria, and in the elderly (see also above). Chloroquine and hydroxychloroquine may exacerbate psoriasis and aggravate myasthenia gravis. Concurrent use of hepatotoxic drugs should be avoided; other interactions: Appendix 1 (chloroquine and hydroxychloroquine).

Screening for ocular toxicity A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009). Chloroquine should be considered (for treating chronic inflammatory conditions) only if other drugs have failed. All patients taking chloroquine should receive ocular examination according to a protocol arranged locally between the prescriber and the ophthalmologist. The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

Before treatment:

- Assess renal and liver function (adjust dose if impaired)
- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist
- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart
- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulphate 6.5 mg/kg daily)

During treatment:

- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart
- Refer to ophthalmologist if visual acuity changes or vision blurred and warn patient to seek prescribing doctor’s advice about stopping treatment
- A child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis
- If long-term treatment is required (more than 5 years), individual arrangement should be agreed with the local ophthalmologist

Hepatic impairment Chloroquine and hydroxychloroquine should be used with caution in moderate to severe hepatic impairment.

Pregnancy It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

Breast-feeding Chloroquine and hydroxychloroquine are present in breast milk and breast-feeding should be avoided when they are used to treat rheumatic disease.

Side-effects The side-effects of chloroquine and hydroxychloroquine include gastro-intestinal disturbances, headache and skin reactions (rashes, pruritus); those occurring less frequently include ECG changes, convulsions, visual changes, retinal damage (see above), keratopathy, otopotoxicity, hair depigmentation, hair loss, and discoloration of skin, nails, and mucous membranes. Side-effects that occur rarely include blood disorders (including thrombocytopenia, agranulocytosis, and aplastic anaemia), mental changes (including emotional disturbances and psychosis), myopathy (including cardiomyopathy and neuromyopathy), acute generalised exanthematous pustulosis, exfoliative dermatitis, Stevens-Johnson syndrome, photosensitivity, and hepatic damage; angioedema has also been reported. Important: very toxic in overdosage—immediate advice from poisons centres essential (see also p. 37).

CHLOROQUINE

Indications active rheumatoid arthritis, systemic and discoid lupus erythematosus; malaria (section 5.4.1)

Cautions see notes above

Hepatic impairment see notes above

Renal impairment manufacturer advises caution; reduce dose

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above
Drugs affecting the immune response

Methotrexate is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. Azathioprine, ciclosporin, cyclophosphamide, leflunomide, and the cytokine modulators are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

Methotrexate is usually given in an initial dose of 7.5 mg by mouth once a week, adjusted according to response to a maximum of 15 mg once a week (occasionally 20 mg once a week). Regular full blood counts (including differential white cell count and platelet counts), renal and liver function tests are required. In patients who experience mucosal or gastrointestinal side-effects with methotrexate, folic acid 5 mg every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Azathioprine is usually given in a dose of up to 2.5 mg/kg daily in divided doses. Blood counts are needed to detect possible neutropenia or thrombocytopenia (usually resolved by reducing the dose). Nausea, vomiting, and diarrhoea may occur, usually starting early during the course of treatment, and may necessitate withdrawal of the drug; herpes zoster infection may also occur.

Leflunomide acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar in efficacy to sulphasalazine and methotrexate, may be chosen when these drugs cannot be used. The active metabolite of leflunomide persists for a long period; active procedures to wash the drug out are required in cases of serious adverse effects, or before starting treatment with another disease-modifying antirheumatic drug, or, in men or women, before conception. Side-effects of leflunomide include bone-marrow toxicity; its immunosuppressive effects increase the risk of infection and malignancy.

Ciclosporin is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide (section 8.1.1) may be used at a dose of 1 to 1.5 mg/kg daily by mouth for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given intravenously in a dose of 0.5 to 1 g (with prophylactic mesna) for severe systemic rheumatoid arthritis and for other connective tissue diseases (especially with active vasculitis), repeated initially at fortnightly then at monthly intervals (according to clinical response and haematological monitoring).

Drugs that affect the immune response are also used in the management of severe cases of systemic lupus erythematosus and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of polymyositis that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine is usually used.

Azathioprine and methotrexate are used in the treatment of psoriatic arthropathy [unlicensed indication] for severe or progressive cases that are not controlled with anti-inflammatory drugs.

AZATHIOPRINE

Indications see notes above; inflammatory bowel disease [unlicensed indication] (section 1.5.3); autoimmune conditions and prophylaxis of transplantation rejection (section 8.2.1); severe refractory eczema [unlicensed indication] (section 13.5.3)

Cautions section 8.2.1

Contra-indications section 8.2.1

Hepatic impairment section 8.2.1

Renal impairment section 8.2.1

Pregnancy section 8.2.1

Breast-feeding section 8.2.1

Side-effects section 8.2.1
Dose
• By mouth, initially, rarely more than 3 mg/kg daily, reduced according to response; maintenance 1–3 mg/kg daily; consider withdrawal if no improvement within 3 months

Preparations
Section 8.2.2

CICLOSPORIN (Cyclosporin)

Indications severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective; severe active ulcerative colitis [unlicensed indication] (section 1.5.3); graft-versus-host disease (section 8.2.2); atopic dermatitis and psoriasis (section 13.5.3)

Cautions section 8.2.2

Additional cautions in rheumatoid arthritis Contra-indicated in abnormal renal function, uncontrolled hypertension (see also below), uncontrolled infections, and malignancy. Measure serum creatinine at least twice before treatment and monitor every 2 weeks for first 3 months, then every 4 weeks (or more frequently if dose increased or concomitant NSAIDs introduced or increased (see also interactions: Appendix 1 (cyclosporin)), reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement, if above 50% reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month, monitor blood pressure (discontinue if hypertensive disease that cannot be controlled by antihypertensive therapy); monitor hepatic function if concomitant NSAIDs given.

Hepatic impairment section 8.2.2

Renal impairment see Cautions above

Pregnancy see section 8.2.2

Breast-feeding section 8.2.2

Side-effects section 8.2.2

Dose
• By mouth, administered in accordance with expert advice, initially 2.5 mg/kg daily in 2 divided doses, if necessary increased gradually after 6 weeks; max. 4 mg/kg daily (discontinue if response insufficient after 3 months); dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks); CHILD and under 18 years

Important For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

Preparations
Section 8.2.2

LEFLUNOMIDE

Indications (specialist use only) moderate to severe active rheumatoid arthritis; active psoriatic arthritis

Cautions impaired bone-marrow function including anaemia, leucopenia or thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis); recent treatment with other hepatotoxic or myelotoxic disease-modifying antirheumatic drugs; washout procedures recommended for serious adverse effects or before switching to other disease-modifying antirheumatic drugs (consult product literature and see Washout Procedure, below); history of tuberculosis; exclude pregnancy before treatment; effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature and see Washout Procedure, below); monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks; monitor liver function—see Hepatic toxicity, below; monitor blood pressure; interactions: Appendix 1 (leflunomide)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported usually in the first 6 months; monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks. Discontinue treatment (and institute washout procedure—consult product literature and see Washout Procedure below) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure

Washout procedure To aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception (see also Pregnancy below), stop treatment and give either ciclosporin or azathioprine 8 g 3 times daily for 11 days or activated charcoal 50 g 4 times daily for 11 days; the concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature. Procedure may be repeated as necessary

Contra-indications severe immunodeficiency; severe hypoproteinaemia; serious infection

Hepatic impairment avoid—active metabolite may accumulate; see also Cautions above

Renal impairment manufacturer advises avoid in moderate or severe impairment—no information available

Pregnancy avoid—active metabolite teratogenic in animal studies; effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (see also Cautions above)

Breast-feeding present in milk in animal studies—manufacturer advises avoid

Side-effects diarrhoea, nausea, vomiting, anorexia, oral mucosal disorders, abdominal pain; increased blood pressure; headache, dizziness, asthma, paraesthesia; leucopenia; tenosynovitis, alopecia, rash, dry skin, pruritus; less commonly taste disturbance, anxiety, hyperlipidaemia, hypokalaemia, hypophosphataemia, anaemia, thrombocytopenia, and tendon rupture; rarely hepatitis, jaundice (see Hepatotoxicity, above), interstitial lung disease, severe infection, esinophilia, and pancytopenia; very rarely pancreatitis, hepatic failure (see Hepatotoxicity, above), peripheral neuropathy; vasculitis, progressive multifocal leucoencephalopathy, Stevens-Johnson syndrome, and toxic epidermal necrolysis; hypouricaemia, reduced sperm count, and renal failure also reported; important: discontinue treatment and institute washout procedure (see Washout Procedure under Cautions) in case of serious side-effect

Dose
• Rheumatoid arthritis, ADULT over 18 years, initially 100 mg once daily for 3 days, then 10–20 mg once daily

• Psoriatic arthritis, ADULT over 18 years, initially 100 mg once daily for 3 days, then 20 mg once daily
10.1.3 Drugs that suppress the rheumatic disease process

Leflunomide (Non-proprietary) Tablets, leflunomide, 10 mg, net price 30-tab pack = £46.00; 20 mg, 30-tab pack = £46.00. Label: 4

Arava® (Sanofi-Aventis) Tablets, f/c, leflunomide 10 mg (white), net price 30-tab pack = £51.13; 20 mg (yellow), 30-tab pack = £61.36; 100 mg (white), 3-tab pack = £30.67. Label: 4

**METHOTREXATE**

**Indications** moderate to severe active rheumatoid arthritis; Crohn’s disease [unlensed indication] (section 1.5.3); malignant disease (section 8.1.3); psoriasis (section 13.5.3)

**Cautions** section 8.1; see CSM advice below (blood count, liver and pulmonary toxicity); extreme caution in blood disorders (avoid if severe); peptic ulceration, ulcerative colitis, diarrhoea and ulcerative stomatitis (withdraw if stomatitis develops—may be first sign of gastro-intestinal toxicity); risk of accumulation in pleural effusion or ascites—drain before treatment; acute porphyria (section 9.8.2); interactions: see below and Appendix 1 (methotrexate)

**CSM advice**

In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate, the CSM has advised:

- full blood count and renal and liver function tests before starting treatment and repeated weekly until therapy stabilised, thereafter patients should be monitored every 2–3 months
- that patients should be advised to report all symptoms and signs suggestive of infection, especially sore throat
- Treatment with folic acid (as calcium folinate, section 8.1) may be required in acute toxicity

**Blood count** Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug. A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.

**Liver toxicity** Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate

**Pulmonary toxicity** Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected

**Aspirin and other NSAIDs** If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored. Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen

**Contra-indications** see Cautions above; active infection and immunodeficiency syndromes

**Hepatic impairment** avoid—dose-related toxicity; see also Cautions above

**Renal impairment** reduce dose; risk of nephrotoxicity at high doses; avoid in severe impairment

**Pregnancy** avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); effective contraception required during and for at least 3 months after treatment in men or women; see also section 8.1

**Breast-feeding** discontinue breast-feeding; present in milk

**Side-effects** section 8.1; also anorexia, abdominal discomfort, dyspepsia, gastro-intestinal ulceration and bleeding, diarrhoea, toxic megacolon, hepatotoxicity (see Cautions above); hypotension, pericarditis, pericardial tamponade; pulmonary oedema, pleuritic pain, pulmonary fibrosis, interstitial pneumonitis (see also Pulmonary Toxicity above); ana-phylactic reactions, urticaria; dizziness, fatigue, chills, fever, drowsiness, malaise, headache, mood changes, neurotoxicity; confusion, paraesthesia; precipitation of diabetes; menstrual disturbances, vaginitis, cystitis, reduced libido, impotence; blood disorders; haematuria, dysuria, renal failure; osteoporosis, arthralgia, myalgia, vasculitis; conjunctivitis, visual disturbance; rash, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity; changes in nail and skin pigmentation, telangiectasia, acne, furunculosis, ecchymosis; injection-site reactions

**Dose**

- Moderate to severe active rheumatoid arthritis, by mouth, 7.5 mg once weekly, adjusted according to response; max. weekly dose 20 mg
- Severe active rheumatoid arthritis, by subcutaneous or by intramuscular or by intravenous injection, 7.5 mg once weekly, increased according to response by 2.5 mg weekly; max. weekly dose 25 mg

**Important**

Note that the above dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid)
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath)

**Methotrexate** (Non-proprietary) Tablets, yellow, methotrexate 2.5 mg, net price 28-tab pack = £3.27. Counselling, dose, NSAIDs

Brands include: Meatrox™

**Parenteral preparations** See also section 8.1.3

**Metotrex®** (Medac) Injection, prefilled syringe, methotrexate (as disodium salt) 50 mg/mL, net price 0.15 mL (7.5 mg) = £14.85, 0.2 mL (10 mg) = £15.29, 0.3 mL (15 mg) = £16.57, 0.4 mL (20 mg) = £17.84, 0.5 mL (25 mg) = £18.48, 0.6 mL (30 mg) = £18.95

**Cytokine modulators**

Cytokine modulators should be used under specialist supervision.

Adalimumab, certolizumab pegol, etanercept, golimumab, and infliximab inhibit the activity of tumour necrosis factor alpha (TNF-α).

Adalimumab is licensed for moderate to severe active rheumatoid arthritis when response to other disease-
modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance October 2007, below and August 2010, p. 649); it can also be used for severe, active, and progressive disease in adults not previously treated with methotrexate. It is also licensed for active polyarticular juvenile idiopathic arthritis in adolescents who have not responded adequately to one or more disease-modifying antirheumatic drugs. In the treatment of rheumatoid arthritis and polyarticular juvenile idiopathic arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive psoriatic arthritis (see also NICE guidance, p. 649) and severe active ankylosing spondylitis (see also NICE guidance, p. 649) that have not responded adequately to other disease-modifying anti-rheumatic drugs. For the role of adalimumab in plaque psoriasis, see section 13.5.3.

Certolizumab pegol is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated.

**NICE guidance**

**Certolizumab pegol for the treatment of rheumatoid arthritis (February 2010)**

Certolizumab pegol is recommended as an option for the treatment of patients with rheumatoid arthritis only if:

- certolizumab pegol is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitor treatments, (see Adalimumab, Etanercept and Infliximab for the treatment of Rheumatoid Arthritis, below) and the manufacturer provides the first 12 weeks of certolizumab pegol (10 prefilled 200-mg syringes) free of charge to all patients starting treatment.

Etanercept is licensed for the treatment of moderate to severe active rheumatoid arthritis either alone or in combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate (see also NICE guidance October 2007, below and August 2010, p. 649). It is also licensed for the treatment of active polyarticular juvenile idiopathic arthritis in children who have not responded adequately to or are intolerant of methotrexate (see also NICE guidance, p. 649), active and progressive psoriatic arthritis inadequately responsive to other disease-modifying antirheumatic drugs (see also NICE guidance, p. 649), and for severe ankylosing spondylitis inadequately responsive to conventional therapy (see also NICE guidance, p. 649). For the role of etanercept in plaque psoriasis, see section 13.5.3.

Golimumab is licensed in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate. Golimumab is also licensed for the treatment of active and progressive psoriatic arthritis, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active ankylosing spondylitis when there is an inadequate response to conventional treatment.

**Infliximab** is licensed for the treatment of active rheumatoid arthritis in combination with methotrexate when the response to other disease-modifying anti-rheumatic drugs, including methotrexate, is inadequate (see also NICE guidance October 2007, below and August 2010, p. 649); it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of ankylosing spondylitis, in patients with severe axial symptoms who have not responded adequately to conventional therapy (but see also NICE guidance, p. 649) and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive psoriatic arthritis which has not responded adequately to disease-modifying anti-rheumatic drugs (see also NICE guidance, p. 649).

**Rituximab** is licensed in combination with methotrexate for the treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (see also NICE guidance, p. 649). For the role of rituximab in malignant disease, see section 8.2.3.

**NICE guidance**

**Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007)**

The tumour necrosis factor alpha (TNF-α) inhibitors adalimumab, etanercept, and infliximab are options for the treatment of adults with active rheumatoid arthritis who have failed to respond to at least 2 disease-modifying antirheumatic drugs (DMARDs), including methotrexate (unless contra-indicated). TNF-α inhibitors should be given in combination with methotrexate; however, when methotrexate cannot be used because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy.

Adalimumab, etanercept, and infliximab should be withdrawn if response is not adequate within 6 months. Response to treatment should be monitored at least every 6 months in patients who respond initially; treatment should be withdrawn if response is not maintained. An alternative TNF-α inhibitor may be considered for patients in whom treatment is withdrawn because of intolerance before the initial 6-month assessment of efficacy.

**Use of TNF-α inhibitors for the treatment of severe, active, and progressive rheumatoid arthritis in adults not previously treated with methotrexate or other DMARDs is not recommended.**
BNF 61 10.1.3 Drugs that suppress the rheumatic disease process 649

NICE guidance
Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of severe active rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)

Adalimumab or etanercept are recommended as treatment options for adults with severe active rheumatoid arthritis (including at least one modifying antirheumatic drug). Adalimumab or etanercept should be used in combination with methotrexate, as an option for the treatment of severe active rheumatoid arthritis in adults who have an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.

Adalimumab, etanercept, infliximab, or abatacept, in combination with methotrexate, are options for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least one TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

NICE guidance
Etanercept for the treatment of juvenile idiopathic arthritis (May 2002)

Etanercept is recommended in children aged 4–17 years with active polyarticular-course juvenile idiopathic arthritis who have not responded adequately to methotrexate or who are intolerant of it. Etanercept should be used under specialist supervision according to the guidelines of the British Society for Paediatric and Adolescent Rheumatology (previously the British Paediatric Rheumatology Group).

Etanercept should be withdrawn if severe side-effects develop or if there is no response after 6 months or if the initial response is not maintained. There is no evidence to support treatment for longer than 2 years; a decision to continue therapy should be based on disease activity and clinical effectiveness in individual cases.

Prescribers of etanercept should register consenting patients with the Biologics Registry of the British Society for Paediatric and Adolescent Rheumatology.

NICE guidance
Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)

Etanercept, infliximab, or adalimumab are recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Etanercept, infliximab, and adalimumab should be discontinued if there is an inadequate response at 12 weeks.

Side-effects
Adalimumab, certolizumab pegol, etanercept, golimumab, infliximab, and rituximab have been associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation. Other side-effects include nausea, abdominal pain, worsening heart failure, hypersensitivity reactions, fever, headache, depression, antibody formation (including lupus erythematosus-like syndrome), pruritus, injection-site reactions, and blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia, and aplastic anaemia).

Abatacept prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active rheumatoid arthritis in combination with methotrexate, in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor); see also NICE guidance, above. It is also licensed for the treatment of moderate to severe active polyarticular juvenile idiopathic arthritis (in combination with methotrexate) in children who have not responded adequately to other disease-modifying antirheumatic drugs (including at least one tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.
The Scottish Medicines Consortium (p. 4) has advised (August 2007) that abatacept is not recommended for the treatment of moderate to severe active rheumatoid arthritis within NHS Scotland.

Anakinra inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of rheumatoid arthritis which has not responded to methotrexate alone; it is not, however, recommended for routine management of rheumatoid arthritis, see NICE guidance below.

The Scottish Medicines Consortium (p. 4) has advised (July 2002) that anakinra is not recommended for the treatment of rheumatoid arthritis within NHS Scotland.

(continued on next page)
**Pregnancy** avoid; manufacturer advises effective contraception required during treatment and for at least 5 months after last dose

**Breast-feeding** avoid; manufacturer advises avoid for at least 5 months after last dose

**Side-effects** see under Cytokine Modulators (p. 649) and Cautions above; also vomiting, dyspepsia, gastrointestinal haemorrhage; dizziness, hyperlipidaemia, hypertension, oedema, flushing, chest pain, tachycardia; cough, dyspnoea; mood changes, sleep disturbances, anxiety, paraesthesia; haematuria, renal impairment; benign tumours, non-melanoma skin cancers; electrolyte disturbances, hyperuricaemia; musculoskeletal pain; eye disorders; rash, dermatitis, onycholysis, impaired healing; less commonly dysphagia, pancreatitis, cholecithiasis, hepatitis, pancreatitis, cholestasis, asthma, dyspnoea, interstitial lung disease, pneumonitis, tremor, erectile dysfunction, nocturia, malignancy, rhabdomyolysis, hearing loss, tinnitus; rarely vascular occlusion, myocardial infarction, demyelinating disorders, pulmonary embolism, pleural effusion, Stevens-Johnson syndrome, cutaneous vasculitis, new onset or worsening psoriasis, and hepatosplenic T-cell lymphoma also reported

**Injection**

- **Certolizumab pegol**
  - **Indications** see under Cytokine Modulators above
  - **Cautions** predisposition to infection; monitor for infections before, during, and for 5 months after treatment (see also Tuberculosis below), do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate to severe heart failure); demyelinating CNS disorders (risk of exacerbation); history or development of malignancy; **interactions**: Appendix 1 (certolizumab pegol)
  - **Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop
  - **Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop
  - **Contra-indications** severe active infection (see also Cautions)
  - **Pregnancy** avoid; manufacturer advises adequate contraception during treatment and for at least 5 months after last dose
  - **Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

- **Humira® (Abbott)**
  - **Injection** adalimumab, net price 40-mg prefilled pen or prefilled syringe = £357.50. Counselling, tuberculosis

**Anakinra**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infections; history of asthma (risk of serious infection); **interactions**: Appendix 1 (anakinra)

**Blood disorders** Neutropenia reported commonly. Monitor neutrophil count before treatment, then every month; then every 3 months—discontinue if neutropenia develops. Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, infection) develop

**Contra-indications** neutropenia

**Renal impairment** caution if eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid; effective contraception must be used during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** injection-site reactions; headache; infections, neutropenia (see also Cautions), and antibody formation; also reported malignancy

**Dose**

- **By subcutaneous injection, ADULT over 18 years, 100 mg once daily**
ETANERCEPT

Indications  see under Cytokine Modulators above

Cautions  predisposition to infection (avoid if predisposition to septicemia); significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin; hepatitis B virus—monitor for active infection; monitor for worsening interstitial lung disease (e.g. during outbreaks of infectious mononucleosis); monitor for demyelinating CNS disorders; diabetes mellitus;

interactions: Appendix 1

Tuberculosis  Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders  Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Contra-indications  active infection; avoid injections containing benzyl alcohol in neonates (see preparations below)

Hepatic impairment  use with caution in moderate to severe alcoholic hepatitis

Pregnancy  manufacturer advises avoid—no information available

Breast-feeding  manufacturer advises avoid—present in milk in animal studies

Side-effects  see under Cytokine Modulators (p. 649); also less commonly interstitial lung disease, non-melanoma skin cancer, rash, psoriasis (including new onset); rarely demyelinating disorders, seizures, Stevens-Johnson syndrome, and cutaneous vasculitis; very rarely toxic epidermal necrolysis; also reported appendicitis, cholecystitis, gastritis, gastro-intestinal haemorrhage, intestinal obstruction, liver damage, oesophagitis, pancreatitis, ulcerative colitis, vomiting, cerebral ischaemia, hypertension, hypotension, myocardial infarction, thrombophlebitis, thrombocytopenia, asthma, dyspnoea, aseptic meningitis, confusion, paresis, paraesthesia, vertigo, lymphadenopathy, diabetes mellitus, haematuria, malignancy, renal calculi, renal impairment, bone fracture, bursitis, polyomysitis, scleritis, and cutaneous ulcer

Dose  By subcutaneous injection, rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, ADULT over 18 years, 25 mg twice weekly or 50 mg once weekly Active polyarticular juvenile idiopathic arthritis, CHILD 4–17 years, 400 micrograms/kg (max. 25 mg) twice weekly, with an interval of 3–4 days between doses

GOLIMUBAB

Indications  see under Cytokine Modulators above

Cautions  predisposition to infection; monitor for infections before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen); demyelinating CNS disorders (risk of exacerbation); history or development of malignancy;

interactions: Appendix 1 (golimumab)

Tuberculosis  Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with golimumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders  Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Contra-indications  severe active infection (see also Cautions); moderate or severe heart failure

Hepatic impairment  manufacturer advises caution—no information available

Pregnancy  use only if essential; manufacturer advises adequate contraception during treatment and for at least 6 months after last dose

Breast-feeding  manufacturer advises avoid during and for at least 6 months after treatment—present in milk in animal studies

Side-effects  see under Cytokine Modulators (p. 649) and Under Cautions above; also constipation, dyspepsia, hypertension, insomnia, dizziness, paraesthesia, asthenia, alopecia, dermatitis; less commonly taste disturbance, gastritis, colitis, stomatitis, gastrooesophageal reflux disease, cholelithiasis, hepatic disorders, hyperlipidaemia, arrhythmia, ischaemic coronary artery disorders, Raynaud’s syndrome, heart failure, thrombosis, flushing, bronchospasm, demyelinating disorders, hyperglycaemia, thyroid disorders, menstrual disorders, malignancy, bone fractures.
visual disturbance, eye irritation, new onset or worsening psoriasis; rarely interstitial lung disease, renal impairment

**Dose**
- **By subcutaneous injection, ADULT** over 18 years, 50 mg once a month on the same date each month, review treatment if no response after 3–4 doses; body weight over 100 kg, if inadequate response to 3–4 doses of 50 mg, once a month, dose can be increased to 100 mg once a month, review treatment if inadequate response to this higher dose after 3–4 doses

**Note** If dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date

**Side-effects** see under Cytokine Modulators (p. 649) and under Cautions above; also diarrhoea, dyspepsia, hepatic impairment; flushing, chest pain; dyspnoea; dizziness, fatigue; sinusitis; rash, sweating, dry skin; less commonly constipation, gastro-oesophageal reflux, diverticulitis, cholecystitis, palpitation, arrhythmia, hypertension, hypotension, vasospasm, cyanosis, bradycardia, syncope, oedema, thrombo-phlebitis, epistaxis, bronchospasm, pleurisy, confusion, agitation, nervousness, amnesia, sleep disturbances, vaginitis, demelinating disorders, antibody formation, pyelonephritis, myalgia, arthralgia, eye disorders, abnormal skin pigmentation, antibody formation, Stevens-Johnson syndrome, toxic epidermal necrolysis; neuropathy, paraesthesia, and transverse myelitis; interstitial lung disease, new onset or worsening psoriasis also reported

**Dose**
- **By intravenous infusion**, rheumatoid arthritis (in combination with methotrexate), **ADULT** over 18 years, 3 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; if response inadequate after 12 weeks, dose may be increased in steps of 1.5 mg/kg every 8 weeks, up to max. 7.5 mg/kg every 8 weeks; alternatively, 3 mg/kg may be given every 4 weeks; discontinue if no response by 12 weeks of initial infusion or after dose adjustment

**Note** Ankylosing spondylitis, **ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 6–8 weeks; discontinue if no response by 6 weeks of initial infusion

Psoriatic arthritis (in combination with methotrexate), **ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks

**Preparations** Section 8.2.3
10.1.4 Gout and cytotoxic-induced hyperuricaemia

**TOCILIZUMAB**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection or history of recurrent or chronic infection; interrupt treatment if serious infection occurs; history of intestinal ulceration or diverticulitis; monitor hepatic transaminases every 4–8 weeks for first 6 months, then every 12 weeks; monitor neutrophil and platelet counts 4–8 weeks after starting treatment and then as indicated; low platelet or absolute neutrophil count (avoid if absolute neutrophil count less than 0.5 x 10^9/litre or platelet count less than 50 x 10^9/microlitre); monitor lipid profile 4–8 weeks after starting treatment and then as indicated; monitor for demyelinating disorders; **Interactions**: Appendix I (tocilizumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Patients with latent tuberculosis should be treated with standard therapy (section 5.1.9) before starting tocilizumab

**Counselling** Patients should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur

**Contra-indications** severe active infection (see also Cautions)

**Hepatic impairment** manufacturer advises caution (see also Dose below)

**Renal impairment** manufacturer advises monitor renal function closely in moderate or severe impairment

**Pregnancy** manufacturer advises avoid unless essential (toxicity in animal studies); effective contraception required during and for 6 months after treatment

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk — no information available

**Side-effects** abdominal pain, mouth ulceration, gastritis, raised hepatic transaminases; dizziness, peripheral oedema, hypertension, hypercholesterolaemia; headache; infection (including upper respiratory–tract infection); antibody formation, hypersensitivity, leucopenia, neutropenia; rash, pruritus; less commonly gastric ulcer, gastro-intestinal perforation, hypertriglyceridaemia, hypothyroidism, nephrotic syndrome, infusion related reactions, anaphylaxis, and thrombocytopenia also reported

**Dose**

- By intravenous infusion, **ADULT** over 18 years, 8 mg/kg (max. 800 mg) every 4 weeks; for details of dose adjustment in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count, consult product literature

**RoActemra®** (Roche)

Concentrate for intravenous infusion, tocilizumab 20 mg/mL, net price 4 mL (80-mg) vial = £102.40, 10 mL (200-mg) vial = £256.00, 20 mL (400-mg) vial = £512.00. Alert card, counselling, see above

**Sulfasalazine**

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Side-effects include rashes, gastro-intestinal intolerance and, especially in patients with rheumatoid arthritis, occasional leucopenia, neutropenia, and thrombocytopenia. These haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment. Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months (liver function tests also being performed at monthly intervals for the first 3 months). Although the manufacturer recommends renal function tests, evidence of practical value is unsatisfactory.

**SULFASALAZINE**

(Sulphasalazine)

**Indications** active rheumatoid arthritis; inflammatory bowel disease, see section 1.5.1 and notes above

**Cautions** see section 1.5.1 and notes above

**Blood disorders** Patients should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

**Contra-indications** see section 1.5.1 and notes above

**Hepatic impairment** section 1.5.1

**Renal impairment** section 1.5.1

**Pregnancy** section 1.5.1

**Breast-feeding** section 1.5.1

**Side-effects** see section 1.5.1 and notes above

**Dose**

- **By mouth,** administered on expert advice, as enteric-coated tablets, initially 500 mg daily, increased by 500 mg at intervals of 1 week to a max. of 2–3 g daily in divided doses

Sulfasalazine (Non-proprietary)

Tablets, e/c, sulfasalazine 500 mg, net price 112-tab pack = £14.46 Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Brands include Salazine BC®

Salazopyrin EN-Tabs® (Pharmacia)

Tablets, e/c, yellow, f/c, sulfasalazine 500 mg, net price 112-tab pack = £8.43. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

---

10.1.4 Gout and cytotoxic-induced hyperuricaemia

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack.

**Acute attacks of gout**

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac, etoricoxib, indometacin, ketoprofen, naproxen, or sulindac (section 10.1.1). Colchicine is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin is not indicated in gout. Allopurinol, febuxostat, and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.
The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute mono-articular gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

**COLCHICINE**

**Indications** acute gout; short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs; prophylaxis of familial Mediterranean fever (recurrent polyserositis)

**Cautions** see notes above; also elderly; gastro-intestinal disease; cardiac disease; interactions: Appendix 1 (colchicine)

**Contra-indications** blood disorders

**Hepatic impairment** use with caution

**Renal impairment** reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** avoid—teratogenicity in animal studies

**Breast-feeding** present in milk but no adverse effects reported; manufacturers advise caution

**Side-effects** nausea, vomiting, and abdominal pain; excessive doses may cause profuse diarrhoea, gastrointestinal haemorrhage, rash, renal and hepatic damage; rarely peripheral neuritis, inhibition of spermatogenesis, myopathy, alopecia, and with prolonged treatment blood disorders

**Dose**
- Acute gout, 500 micrograms 2–4 times daily until symptoms relieved, max. 6 mg per course; course not to be repeated within 3 days
- Prevention of gout attacks during initial treatment with allopurinol or uricosuric drugs, 500 micrograms twice daily
- Prophylaxis of familial Mediterranean fever [unlicensed], 0.5–2 mg once daily

**Note** BNF doses may differ from those in the product literature

**Colchicine** 

**Tablets** colchicine 500 micrograms, net price 100 = £31.33

**Long-term control of gout**

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term (‘interval’) treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol or febuxostat; alternatively the uricosuric drug sulfinpyrazone may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is not indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Febuxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is not indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.

**NICE guidance**

Febuxostat for the management of hyperuricaemia in patients with gout (December 2008)

Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness.

Sulfinpyrazone can be used instead of allopurinol, or in conjunction with it in cases that are resistant to treatment.

Probenecid (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is a uricosuric drug used to prevent nephrotoxicity associated with cidofovir (section 5.3.2.2).

Benzbromarone (available from ‘special-order’ manufacturers or specialist importing companies, see p. 988) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless not indicated in gout.

**ALLOPURINOL**

**Indications** prophylaxis of gout and of uric acid and calcium oxalate renal stones; prophylaxis of hyperuricaemia associated with cancer chemotherapy

**Cautions** administer prophylactic NSAID (not aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack; ensure adequate fluid intake (2–3 litres/day); hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy; interactions: Appendix 1 (allopurinol)

1. The Scottish Medicines Consortium issued similar advice in August 2010
Contra-indications not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately (see notes above)

Hepatic impairment reduce dose
Renal impairment max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 10 micromol/litre
Pregnancy toxicity not reported; manufacturer advises use only if no safer alternative and disease carries risk for mother or child
Breast-feeding present in milk—not known to be harmful

Side-effects rashes [withdraw] therapy; if rash mild re-introduce cautiously but discontinue promptly if recurrence—hypo-osmolarity reactions occur rarely and include exfoliation, fever, lymphadenopathy, arthralgia, and eosinophilia resembling Stevens-Johnson syndrome or toxic epidermal necrolysis, vasculitis, hepatitis, renal impairment, and very rarely seizures); gastro-intestinal disorders; rarely malaise, headache, vertigo, drowsiness, visual and taste disturbances, hypertension, alopecia, hepatotoxicity, paraesthesia and neuropathy, gynaecomastia, blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia and aplastic anaemia)

Dose
- Initially 100 mg daily, preferably after food, then adjusted according to plasma or urinary uric acid concentration; usual maintenance dose in mild conditions 100–200 mg daily, in moderately severe conditions 300–600 mg daily, in severe conditions 700–900 mg daily; doses over 300 mg daily given in divided doses; CHILD under 15 years, (in neoplastic conditions, enzyme disorders) 10–20 mg/kg daily (max. 400 mg daily)

Allopurinol (non-proprietary)

Tablets, allopurinol 100 mg, net price 28-tab pack = £1.18; 300 mg, 28-tab pack = £1.32. Label: 8, 21, 27

Brands include Clophenal®, Cosar®, Rimapurin®

Zyloric® (GSK)

Tablets, allopurinol 100 mg, net price 100-tab pack = £10.19; 300 mg, 28-tab pack = £7.31. Label: 8, 21, 27

FEBUXOSTAT

Indications treatment of chronic hyperuricaemia in gout (but see also NICE guidance above)

Cautions administer prophylactic NSAID (not aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack; transplant recipients; monitor liver function tests before and periodically during treatment as indicated; thyroid disorders; interactions: Appendix 1 (febuxostat)

Contra-indications not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately (see notes above); ischaemic heart disease; congestive heart failure

Hepatic impairment max. 80 mg daily in mild impairment; no dose information available in moderate or severe impairment
Renal impairment use with caution if eGFR less than 30 mL/minute/1.73 m²—no information available

Pregnancy manufacturer advises caution

Breast-feeding not a treatment for acute gout but treat attack separately (see notes above)

SULFINPYRAZONE (Sulphinpyrazone)

Indications gout prophylaxis, hyperuricaemia

Cautions see under Probenecid; regular blood counts advisable; cardiac disease (may cause salt and water retention); interactions: Appendix 1 (sulfinpyrazone)

Contra-indications see under Probenecid; avoid in hypersensitivity to NSAIDs

Hepatic impairment avoid in severe impairment

Renal impairment reduce dose; avoid in severe impairment

Pregnancy manufacturer advises caution

PROBENECID

Indications prevention of nephrotoxicity associated with cidofovir (section 5.3.2.2)

Cautions ensure adequate fluid intake (about 2–3 litres daily) and render urine alkaline if uric acid overload is high; peptic ulceration; transient false-positive Benedict’s test; G6PD-deficiency (section 9.1.5); interactions: Appendix 1 (probenecid)

Contra-indications history of blood disorders, nephrotoxicity, acute porphyria (section 9.8.2), acute gout attack; avoid aspirin and salicylates

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²

Breast-feeding present in milk

Side-effects gastro-intestinal disturbances; less commonly sore gums, flushing, headache, dizziness, urinary frequency, anaemia, alopecia; hepatic necrosis, hypersensitivity reactions (including anaphylaxis, pruritus, urticaria, fever, and Stevens-Johnson syndrome), nephrotic syndrome, haemolytic anaemia, leucopenia, and aplastic anaemia also reported

Dose
- Used with cidofovir, see section 5.3.2.2

Probenecid (non-proprietary)

Tablets, probenecid 500 mg. Label: 12, 21, 27
Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988
Breast-feeding no information available
Side-effects gastro-intestinal disturbances, occasionally allergic skin reactions, salt and water retention; rarely blood disorders, gastro-intestinal ulceration and bleeding, acute renal failure, raised liver enzymes, jaundice and hepatitis
Dose
- Initially 100–200 mg daily with food (or milk) increasing over 2–3 weeks to 600 mg daily (rarely 800 mg daily), continued until serum uric acid concentration normal then reduced for maintenance (maintenance dose may be as low as 200 mg daily)
Sulfinpyrazone (Non-proprietary) Tablets, sulfinpyrazone 100 mg, net price 84-tab pack = £13.09; 200 mg, 84-tab pack = £25.07. Label: 12, 21
Hyperuricaemia associated with cytotoxic drugs
Allopurinol is used to prevent hyperuricaemia associated with cytotoxic drugs—see section 8.1 (Hyperuricaemia) and Allopurinol above.
Rasburicase is licensed for the prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and a high tumour burden at risk of rapid lysis.

RASBURICASE
Indications prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy
Cautions monitor closely for hypersensitivity; atopic allergies; may interfere with test for uric acid—consult product literature
Contra-indications G6PD deficiency (section 9.1.5)
Pregnancy manufacturer advises avoid—no information available
Breast-feeding manufacturer advises avoid—no information available
Side-effects fever; less commonly nausea, vomiting, diarrhoea, headache, hypersensitivity reactions (including rash, bronchospasm and anaphylaxis); haemolytic anaemia, methaemoglobinaemia
Dose
- By intravenous infusion, 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration
Fasturtec® (Sanofi-Aventis) Tablets, rasburicase, net price 1.5-mg vial (with solvent) = £57.88; 7.5-mg vial (with solvent) = £241.20
Glucosamine
Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin. It is licensed for symptomatic relief of mild to moderate osteoarthritis of the knee, but is not recommended. The mechanism of action is not understood and there is limited evidence to show it is effective.

The Scottish Medicines Consortium (p. 4) has advised (May 2008) that glucosamine (Alateris®) is not recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.

GLUCOSAMINE
Indications symptomatic relief of mild to moderate osteoarthritis of the knee
Cautions impaired glucose tolerance (monitor blood-glucose concentration before treatment and periodically thereafter); predisposition to cardiovascular disease (monitor cholesterol); asthma; interactions: Appendix 1 (glucosamine)
Contra-indications shellfish allergy
Pregnancy manufacturer advises avoid—no information available
Breast-feeding manufacturer advises avoid—no information available
Side-effects nausea, abdominal pain, dyspepsia, flatulence, diarrhoea, headache, fatigue; less commonly flushing, rash, pruritus; also reported hypercholesterolaemia, visual disturbances, hair loss
Dose
- See under preparations
Alateris® (Dee) Tablets, glucosamine (as hydrochloride) 625 mg, net price 60-tab pack = £18.40
Dose ADULT over 18 years, 1 25 g once daily; review treatment if no benefit after 2–3 months
Glarusarte® (HFA Healthcare) Oral powder, sugar-free, glucosamine sulphate (as sodium chloride) 1.5 g/sachet, net price 30-sachet pack = £18.40. Label: 13
Electrolytes Na+ 6.6 mmol/sachet
Excipients include aspartame (section 9.4.1)
Dose ADULT over 18 years, 1 sachet (dissolved in at least 250 mL of water) once daily; review treatment if no benefit after 2–3 months

10.2 Drugs used in neuromuscular disorders
10.2.1 Drugs that enhance neuromuscular transmission
10.2.2 Skeletal muscle relaxants
10.2.1 Drugs that enhance neuromuscular transmission
Anticholinesterases are used as first-line treatment in ocular myasthenia gravis and as an adjunct to immunosuppressant therapy for generalized myasthenia gravis.
Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine is frequently used to reduce the dose of corticosteroid.
Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine.

Edrophonium has a very brief action and it is therefore used mainly for the diagnosis of myasthenia gravis. However, such testing should be performed only by those experienced in its use; other means of establishing the diagnosis are available. A single test-dose usually causes substantial improvement in muscle power (lasting about 5 minutes) in patients with the disease (if respiration already impaired, only in conjunction with someone skilled at intubation).

Edrophonium can also be used to determine whether a patient with myasthenia is receiving inadequate or excessive treatment with cholinergic drugs. If treatment is excessive an injection of edrophonium will either have no effect or will intensify symptoms (if respiration already impaired, give only in conjunction with someone skilled at intubation). Conversely, transient improvement may be seen if the patient is being inadequately treated. The test is best performed just before the next dose of anticholinesterase.

Neostigmine produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine or propantheline may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required. It is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily.

Distigmine has the longest action but the danger of a cholinergic crisis caused by accumulation of the drug is greater than with shorter-acting drugs; it is rarely used in the management of myasthenia gravis.

Neostigmine and edrophonium are also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (see section 15.1.6).

**Neostigmine**

**Indications** myasthenia gravis; other indications (section 15.1.6)

**Cautions** asthma (extreme caution), bradycardia, arrhythmias, recent myocardial infarction, epilepsy, hypotension, parkinsonism, vagotonia, peptic ulceration, hyperthyroidism; atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection), but not given routinely because it may mask signs of overdosage; interactions: Appendix 1 (parasympathomimetics)

**Contra-Indications** intestinal or urinary obstruction

**Renal impairment** may need dose reduction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** amount probably too small to be harmful

**Side-effects** nausea, vomiting, increased salivation, diarrhoea, abdominal cramps (more marked with higher doses); signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation and micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis

**Dose**

- By mouth, neostigmine bromide 15–30 mg at suitable intervals throughout day, total daily dose 75–300 mg (but see also notes above); NEONATE 1–5 mg every 4 hours, half an hour before feeds; CHILD up to 6 years initially 7.5 mg, 6–12 years initially 15 mg, usual total daily dose 15–90 mg
- By subcutaneous or intramuscular injection, ADULT and CHILD over 12 years, neostigmine metilsulfate 1–2.5 mg at suitable intervals throughout day (usual total daily dose 5–20 mg); NEONATE 150 micrograms/kg every 6–8 hours 30 minutes before feeds, increased to max. 300 micrograms/kg every 4 hours, if necessary [unlicensed]; CHILD 1 month–12 years 200–500 micrograms as required

**Neostigmine**

 Tablets, scored, neostigmine bromide 15 mg, net price 140 = £56.10

**Injection**

Section 15.1.6

**Edrophonium Chloride**

**Indications** see under Dose and notes above; reversal of non-depolarising neuromuscular blockade and diagnosis of dual block (section 15.1.6)

**Cautions** see under Neostigmine; have resuscitation facilities; extreme caution in respiratory distress (see notes above) and in asthma

**Note** Severe cholinergic reactions can be counteracted by injection of atropine sulphate (which should always be available)

**Contra-Indications** see under Neostigmine
In generalised myasthenia gravis, azathioprine (section 8.2.1) is usually started at a high dose. However, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days. Smaller doses of corticosteroid are usually required in ocular myasthenia. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose (usually 10–40 mg on alternate days).

In generalised myasthenia gravis azathioprine (section 8.2.1) is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used; azathioprine is initiated at a dose of 0.5–1 mg/kg daily, which is increased over 3–4 weeks to 2–2.5 mg/kg daily. Ciclosporin (section 8.2.2), methotrexate (section 8.1.3), or mycophenolate mofetil (section 8.2.1) can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

10.2.2 Skeletal muscle relaxants

The drugs described below are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm associated with minor

Acetylcholine-release enhancers

Amifampridine is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

AMIFAMPRIDINE

Indications (specialist use only) symptomatic treatment of Lambert-Eaton myasthenic syndrome

Cautions concomitant use of drugs that lower con-

Hepatic impairment use with caution; in mild impairment reduce initial dose to 10 mg daily in
divided doses, increased in steps of 5 mg every 7 days; in moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days

Renal impairment use with caution; in mild impair-

Dose

ADULT over 18 years, initially 15 mg daily in 3 divided
doses, increased in steps of 5 mg every 4–5 days; to
max. 60 mg daily in 3–4 divided doses; max. single
dose 20 mg

Firdapse® (Bionar) Tablets, scored, amifampridine (as phosphate) 10 mg, net price 100-tab pack = £1815.00. Label: 3, 21
injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene, has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia (section 15.1.5), which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splitting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

**Baclofen** inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscle hypotonia (other adverse events are uncommon).

A *cannabis extract* containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

**Dantrolene** acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

**Diazepam** can also be used. Sedation and occasionally extensor hypotonia are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses (section 4.1.2).

**Tizanidine** is an alpha,-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.

### BACLOFEN

**Indications** chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord

**Cautions** psychiatric illness, Parkinson’s disease, cerebrovascular disease, elderly, respiratory impairment; epilepsy; history of peptic ulcer (avoid oral route in active peptic ulceration); diabetes; hypertensive bladder sphincter; avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hypothermia, psychiatric reactions and convulsions, see also under Withdrawal below); **interactions**: Appendix 1 (muscle relaxants)

**Withdrawal** Serious side-effects can occur on abrupt withdrawal; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur) Drivinger Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** manufacturer advises use by mouth with caution

**Renal impairment** risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73m² manufacturer advises use by mouth only if potential benefit outweighs risk; excreted by kidney

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies)

**Breast-feeding** present in milk—amount probably too small to be harmful

**Side-effects** gastro-intestinal disturbances, dry mouth; hypotension, respiratory or cardiovascular depression; sedation, drowsiness, confusion, dizziness, ataxia, hallucinations, paresthesiae, hypothermia, insomnia, depression, anxiety, agitation, tremor; seizure; urinary disturbances; myalgia; visual disorders; rash; hyperhidrosis; rarely taste disturbances, abdominal pain, changes in hepatic function, paraesthesia, erectile dysfunction, dysarthria; very rarely hypothermia

**Dose**

- **By mouth**, **ADULT** and **CHILD** over 10 years, initially 5 mg 3 times daily, gradually increased; usual maintenance dose up to 60 mg daily in divided doses (max. 100 mg daily); **CHILD** 1–2 years, initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose 0.75–2 mg/kg daily in divided doses (or 10–20 mg daily in divided doses); **CHILD** 2–6 years, initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose of 0.75–2 mg/kg daily in divided doses (or 20–30 mg daily in divided doses); **CHILD** 6–8 years, initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose of 0.75–2 mg/kg daily in divided doses (or 30–40 mg daily in divided doses); **CHILD** 8–10 years, initially 300 micrograms/kg daily in 4 divided doses, increased gradually to usual maintenance dose of 0.75–2 mg/kg daily in divided doses (or up to 60 mg daily in divided doses)

**Note** Review treatment if no benefit within 6 weeks

- **By intrathecal injection**, see preparation below

**Baclofen** (Non-proprietary) *Tablets*, baclofen 10 mg, net price 84-tab pack = £1.58. Label: 2, 6, 21

**Oral solution**, baclofen 5 mg/5 mL, net price 300 mL = £9.26. Label: 2, 8, 21

**Brands** include Lyfex* (sugar-free)

**Lioresal** (Novartis) *Tablets*, scored, baclofen 10 mg, net price 84-tab pack = £8.67. Label: 2, 8, 21

**Excipients** include gluten

**Liquid**, sugar-free, raspberry-flavoured, baclofen 5 mg/5 mL, net price 300 mL = £7.16. Label: 2, 8, 21

*By intrathecal injection* Lioresal® (Novartis) *Intrathecal injection*, baclofen, 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.19; 500 micrograms/mL, 20-mL amp (for use with implantable pump) = £48.62; 2 mg/mL, 5-mL amp (for use with implantable pump) = £48.62

**Important** Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use

**Dose** by intrathecal injection, specialist use only, severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures, initial test dose 25–50 micrograms over at least 1 minute via catheter or lumbar puncture, increased in 25-microgram steps (not more often than every 24 hours) to max. 100 micrograms to determine appropriate dose then dose-titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging...
from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis; CHILD 4–18 years (spasticity of cerebral origin only), initial test dose 25 micrograms then titrated as for ADULT to maintenance dose (ranging from 24 micrograms to 1.2 mg daily in children under 12 years).

**CANNABIS EXTRACT**

**Indications** adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)

**Cautions** significant cardiovascular disease; history of epilepsy; monitor oral mucosa—interrupt treatment if lesions or persistent soreness; **interactions**: Appendix 1 (cannabis extract)

**Contra-indications** personal or family history of psychosis; history of other severe psychiatric disorder

**Hepatic impairment** manufacturer advises more frequent monitoring in significant impairment—possible risk of prolonged or enhanced effect

**Renal impairment** manufacturer advises more frequent monitoring in significant impairment—possible risk of prolonged or enhanced effect

**Pregnancy** manufacturer advises use only if potential benefit outweighs risks, and recommends effective contraception during and for 3 months after treatment in men and women

**Breast-feeding** avoid—present in milk

**Side-effects** increased or decreased appetite, taste disturbance, constipation, diarrhoea, nausea, vomiting, dry mouth, mouth ulcers, oral pain, dizziness, vertigo, malaise, depression, disorientation, dissociation, mood disturbance, amnesia, impaired attention, drowsiness, dysarthria, blurred vision; less commonly abdominal pain, oromucosal and tooth discoloration, stomatitis, palpitation, tachycardia, hypertension, pharyngitis, syncope, hallucinations, paranoia, delusions, suicidal thoughts; also reported anxiety, seizures

**Dose**
- Consult product literature

**Sativex** (Bayer Schering)  

**Oromucosal spray, Cannabis sativa extract** (containing dronabinol (delta-9-tetrahydrocannabinol) 27 mg and cannabidiol 25 mg/mL), net price 3 × 10 mL units = £375.00. Counselling, driving see above

**Excipients** include propylene glycol

**DANTROLENE SODIUM**

**Indications** chronic severe spasticity of voluntary muscle; malignant hyperthermia (section 15.1.8)

**Cautions** impaired cardiac and pulmonary function; therapeutic effect may take a few weeks to develop—discontinue if no response within 45 days; **interactions**: Appendix 1 (muscle relaxants).

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported, usually if doses greater than 400 mg daily used, in females, patients over 30 years, if history of liver disorders, or concomitant use of hepatotoxic drugs; test liver function before and at intervals during therapy—discontinue if abnormal liver function tests or symptoms of liver disorder are reported, usually if doses greater than 400 mg daily used, in females, patients over 30 years, if history of liver disorders, or concomitant use of hepatotoxic drugs; test liver function before and at intervals during therapy—discontinue if abnormal liver function tests or symptoms of liver disorder

1. Home Office assessing Controlled Drug status of preparation—currently in Schedule 1 of the Misuse of Drugs Regulations 2001, but prescriptions should comply with prescribing requirements for Schedule 2 drugs

(Counselling, see below); re-introduce only if complete reversal of hepatotoxicity

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** acute muscle spasm; avoid when spasticity is useful, for example, locomotion

**Hepatic impairment** avoid—may cause severe liver damage; injection may be used in an emergency for malignant hyperthermia

**Pregnancy** avoid use in chronic spasticity—embryotoxic in animal studies

**Breast-feeding** present in milk—manufacturer advises avoid use in chronic spasticity

**Side-effects** diarrhoea (withdraw if severe, discontinue treatment if recur on re-introduction), nausea, vomiting, anorexia, hepatotoxicity (see above), abdominal pain; pericarditis; pleural effusion, respiratory depression; headache, drowsiness, dizziness, asthenia, fatigue, seizures, fever, chills; speech and visual disturbances; rash; less commonly dysphagia, constipation, exacerbation of cardiac insufficiency, tachycardia, erratic blood pressure, dyspnoea, depression, confusion, nervousness, insomnia, increased urinary frequency, urinary incontinence or retention, haematuria, crystalluria, and increased sweating

**Dose**
- Initially 25 mg daily, may be increased at weekly intervals to max. 100 mg 4 times daily; usual dose 75 mg 3 times daily; **CHILD** 5–18 years see BNf for Children

**Dantrium** (SpePharm)  

**Capsules**. orange/brown, dantrolene sodium 25 mg, net price 100 = £16.87; 100 mg, 100 = £43.07. Label: 2. counselling, driving, hepatotoxicity

**DIAZEPAM**

**Indications** muscle spasm of varied aetiology, including tetanus; other indications (section 4.1.2, section 4.8, section 15.1.4.1)

**Cautions** section 4.1.2; special precautions for intravenous injection (section 4.8.2)

**Contra-indications** section 4.1.2

**Hepatic impairment** section 4.1.2

**Renal impairment** section 4.1.2

**Pregnancy** section 4.1.2

**Breast-feeding** section 4.1.2

**Side-effects** section 4.1.2; also hypotonia

**Dose**
- Muscle spasm, by mouth, 2–15 mg daily in divided doses, increased if necessary in spastic conditions to 60 mg daily according to response
- Cerebral spasticity in selected cases, **CHILD** 2–40 mg daily in divided doses
- By intramuscular or by slow intravenous injection (into a large vein at a rate of not more than 5 mg/minute), in acute muscle spasm, 10 mg repeated if necessary after 4 hours

**Note** Only use intramuscular route when oral and intravenous routes not possible; emulsion formulation preferred for intravenous injection; special precautions for intravenous injection, see section 4.8.2
TIZANIDINE

Indications spasticity associated with multiple sclerosis or spinal cord injury or disease

Cautions elderly; monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue; concomitant administration of drugs that prolong QT interval; avoid abrupt withdrawal (risk of rebound hypertension and tachycardia, see under Withdrawal, below); interactions: Appendix 1 (muscle relaxants)

Withdrawal Rebound hypertension and tachycardia can occur on abrupt withdrawal; to minimise risk, discontinue gradually and monitor blood pressure

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Hepatic Impairment avoid in severe impairment

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding present in milk in animal studies—manufacturer advises caution

Side-effects nausea, vomiting, dyspepsia; hypersensitivity reactions (including urticaria, angioedema, anaphylaxis); fever, headache, drowsiness, dizziness, hypotension, Bradycardia, confusion, amnesia, restlessness, anxiety, tremor, seizures; blurred vision, nasal congestion; rash, pruritus; leucopenia, cholestatic jaundice

Dose

● ADULT over 18 years, initially 2 mg daily as a single dose increased according to response at intervals of at least 3–4 days in steps of 2 mg daily (and given in divided doses) usually up to 24 mg daily in 3–4 divided doses; max. 36 mg daily

Tizanidine (Non-proprietary) (UK)

Tablets, tizanidine (as hydrochloride) 2 mg net price 120-tab pack = £6.22; 4 mg, 120-tab pack = £8.64. Label: 2, 8

Zanaflex® (Cephalon) (UK)

Tablets, scored, tizanidine (as hydrochloride) 2 mg, net price 120-tab pack = £63.00; 4 mg, 120-tab pack = £80.00. Label: 2, 8

Other muscle relaxants

The clinical efficacy of methocarbamol and meprobamate (section 4.1.2) as muscle relaxants is not well established, although they have been included in compound analgesic preparations.

METHOCARBAMOL

Indications short-term symptomatic relief of muscle spasm (but see notes above)

Cautions interactions: Appendix 1 (muscle relaxants)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications coma or pre-coma, brain damage, epilepsy, myasthenia gravis

Hepatic impairment manufacturer advises caution; half-life may be prolonged

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding present in milk in animal studies—manufacturer advises caution

Side-effects nausea, vomiting, dyspepsia; hyper-sensitivity reactions (including urticaria, angioedema, anaphylaxis); fever, headache, drowsiness, dizziness, hypotension, Bradycardia, confusion, amnesia, restlessness, anxiety, tremor, seizures; blurred vision, nasal congestion; rash, pruritus; leucopenia, cholestatic jaundice

Dose

● 1.5 g 4 times daily; may be reduced to 750 mg 3 times daily; ELDERLY up to 750 mg 4 times daily may be sufficient; CHILD not recommended

Robaxin® (Almirall) (UK)

750 Tablets, f/c, scored, methocarbamol 750 mg, net price 100 = £12.65. Label: 2

Nocturnal leg cramps

Quinine salts (section 5.4.1), such as quinine sulphate 200–300 mg at bedtime, are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Patients should be monitored closely during the early stages for adverse effects as well as for benefit. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdosage and accidental fatalities have occurred (see also below).

QUININE

Indications see notes above; malaria (section 5.4.1)

Cautions see section 5.4.1 and notes above

Contra-indications section 5.4.1

Pregnancy section 5.4.1

Breast-feeding section 5.4.1

Side-effects section 5.4.1; important: very toxic in overdosage—immediate advice from poison centres essential (see also p. 37)

Dose

● See notes above

Preparations Section 5.4.1
Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

Prevention of extravasation Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration. Placing a glyceryl trinitrate patch (section 2.6.1) distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

Management of extravasation If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone or dexamethasone (section 6.3.2) can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. Antihistamines (section 3.4.1) and analgesics (section 4.7) may be required for symptom relief. The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase (section 10.3.1). A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dexrazoxane (section 8.1) is licensed for the treatment of anthracycline-induced extravasation.

**HYALURONIDASE**

**Indications** enhance permeation of subcutaneous or intramuscular injections, local anaesthetics and subcutaneous infusions; promote resorption of excess fluids and blood

**Cautions** infants or elderly (control speed and total volume and avoid overhydration especially in renal impairment)

**Contra-indications** do not apply direct to cornea; avoid sites where infection or malignancy; not for anaesthesia in unexplained premature labour; not to be used to reduce swelling of bites or stings; not for intravenous administration

**Side-effects** oedema; rarely local irritation, infection, bleeding, bruising; occasional severe allergy (including anaphylaxis)

**Dose**
- With subcutaneous or intramuscular injection, 1500 units dissolved directly in solution to be injected (ensure compatibility)
- With local anaesthetics, 1500 units mixed with local anaesthetic solution (ophthalmology, 15 units/mL)
- Hypodermoclysis, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid
- Extravasation (see notes above) or haematoma, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, infiltrated into affected area (as soon as possible after extravasation)

**Hyalase®** (Workhardt) **5000**

Injection, powder for reconstitution, hyaluronidase (ovine). Net price 1500-unit amp = £7.60
Rubefacients, topical NSAIDs, capsaicin, and poultices

Rubefacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotinate and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

Topical NSAIDs

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. Topical NSAIDs (e.g. felbinac, ibuprofen, ketoprofen, and piroxicam) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis (see section 10.1).

Cautions

Apply with gentle massage only. Avoid contact with eyes, mucous membranes, and inflamed or broken skin; discontinue if rash develops. Hands should be washed immediately after use. Not for use with occlusive dressings. Topical application of large amounts can result in systemic effects (see section 10.1.1), including hypersensitivity and asthma (renal disease has also been reported). Not generally suitable for children. Patient packs carry a warning to avoid during pregnancy or breast-feeding.

Hypersensitivity

For NSAID hypersensitivity and asthma warning, see p. 631 and p. 632.

Photosensitivity

Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity; patients using preparations containing ketoprofen should be advised to avoid exposure to sunlight of the area treated, and for two weeks after stopping treatment.

Non-proprietary preparations

Ibuprofen (Non-proprietary)

Gel, ibuprofen 5%, net price 30 g = £2.10, 50 g = £3.59, 100 g = £5.88

Dose apply up to 3 times daily

Ketoprofen (Non-proprietary)

Gel, ketoprofen 2.5%, net price 30 g = £3.22, 50 g = £2.83, 100 g = £2.63

Dose apply 2–4 times daily for up to 7 days (usual max. 15 g daily)

Piroxicam (Non-proprietary)

Gel, piroxicam 0.5%, net price 60 g = £2.01; 112 g = £2.93

Dose apply 3–4 times daily

Proprietary preparations

Feldene® (Pfizer)

Gel, piroxicam 0.5%, net price 60 g = £6.00; 112 g = £9.41 (also 7.5 g starter pack, hosp. only)

Excipients include benzyl alcohol, propylene glycol

Dose apply 3–4 times daily; therapy should be reviewed after 4 weeks

Fenbid® Forte Gel (Goldshield)

Gel, ibuprofen 10%, net price 100 g = £6.50

Excipients include benzyl alcohol

Dose apply up to 4 times daily; therapy should be reviewed after 14 days

1. Smaller pack sizes available on sale to the public

Ibugel® Forte (Derma)

Forte gel, ibuprofen 10%, net price 100 g = £5.87

Excipients none as listed in section 13.1.3

Dose apply up to 3 times daily

1. Mobigél® (Goldshield)

Spray, diclofenac sodium 4%, net price 25 g = £5.38

Excipients include propylene glycol

Dose apply 4–5 sprays up to 3 times daily; therapy should be reviewed after 7 days

1. Smaller pack sizes available on sale to the public

1. Oruvail® (Sanofi-Aventis)

Gel, ketoprofen 2.5%, net price 50 g = £3.06; 100 g = £5.89

Excipients include fragrance

Dose apply 2–4 times daily for up to 7 days (usual recommended dose 15 g daily)

1. Smaller pack sizes available on sale to the public

Powergel® (Menarini)

Gel, ketoprofen 2.5%, net price 50 g = £3.06; 100 g = £5.89

Excipients include fragrance

Dose apply 2–3 times daily for up to max. 10 days

Traxam® (Goldshield)

Foam, felbinac 3.17%. Net price 100 g = £7.00.

Label: 15

Excipients none as listed in section 13.1.3

Dose apply 2–4 times daily; max. 25 g daily; therapy should be reviewed after 14 days

Note Felbinac is an active metabolite of the NSAID fenbufen

Voltarol Emulgel® (Novartis)

Gel, diclofenac diethylamine salt 1.16% (equivalent to diclofenac sodium 1%), net price 20 g (hosp. only) = £1.55; 100 g = £7.00

Excipients include propylene glycol, fragrance

Dose apply 3–4 times daily; therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)

1. Various pack sizes available on sale to the public

Voltarol Gel Patch® (Novartis)

Gel patch, diclofenac epolamine (equivalent to 140 mg diclofenac sodium per patch), net price 10-patch pack = £14.09

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose ADULT and CHILD over 15 years, ankle sprain, apply 1 patch daily for up to 3 days; epicondylitis, apply 1 patch twice daily for up to 14 days

Capsaicin

A preparation containing capsaicin 0.025% can be considered as an adjunct in hand or knee osteoarthritis (see section 10.1). It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia (section 4.7.3) after lesions have healed, and for the relief of painful diabetic neuropathy (section 4.1.5).

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.
Zacin® (Cephalon) Cream, capsaicin 0.025%, net price 45 g = £17.71.
Excipients include benzyl alcohol, cetyl alcohol
Cautions avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours
Side-effects transient burning sensation during initial treatment (particularly if too much used or if administered less than 4 times daily); rarely cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported
Dose symptomatic relief in osteoarthritis, apply sparingly 4 times daily (not more often than every 4 hours)

Axsain® (Cephalon) Cream, capsaicin 0.075%, net price 45 g = £14.30.
Excipients include benzyl alcohol, cetyl alcohol
Cautions avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours
Side-effects transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily); rarely cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported
Dose post-herpetic neuralgia (important: after lesions have healed), apply sparingly up to 3–4 times daily (not more often than every 4 hours)
Post-hypertensive neuropathy, under specialist supervision, apply sparingly 3–4 times daily (not more often than every 4 hours) for 8 weeks then review

Qutenza® (Astellas) Patches, self-adhesive, capsaicin 179 mg (8%), net price 1 × 280 cm² patch (with cleansing gel) = £210.00.
Excipients include butylated hydroxyanisole in cleansing gel (see section 13.1.3)
Cautions avoid holding near eyes or mucous membranes; avoid contact with inflamed or broken skin, the face, scalp or in proximity to mucous membranes; monitor blood pressure during treatment procedure; uncontrolled hypertension; recent cardiovascular events
Side-effects application site reactions including transient burning, erythema, pruritus; less commonly nausea, peripheral oedema, first degree AV block, tachycardia, palpitations, hypertension; cough, throat irritation; hypoesthesia, burning sensation, dysgeusia; pain in extremities, muscle spasm, eye irritation, pruritus
Dose peripheral neuropathic pain in non-diabetic patients, applied under supervision of a physician, consult product literature
Note Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection)

Poultices

Kaolin Poultice Poultice, heavy kaolin 52.7%, thymol 0.05%, boric acid 4.5%, peppermint oil 0.05%, methyl salicylate 0.2%, glycerol 42.5%. Net price 200 g = £2.93
Dose warm and apply directly or between layers of muslin; avoid application of overheated poultice

Kaolin Poultice K/L Pack® (K/L) Kaolin poultice Net price 4 × 100-g pouches = £6.40
11.1 Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles; they are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

Eye drops and eye ointments Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

Patients should be warned not to drive or perform other skilled tasks until vision is clear after using eye drops or eye ointments.

For warnings relating to eye drops and contact lenses, see section 11.9.

Eye lotions These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution (section 11.8.1) is usually used. Clean water will suffice in an emergency.

Other preparations Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy. The drug diffuses through the cornea and sclera to the anterior and posterior chambers and vitreous humour. However, because the dose-volume is limited (usually not more than 1 mL), this route is suitable only for drugs which are readily soluble.
11.2 Control of microbial contamination

Preparations for the eye should be sterile when issued. Eye drops in multiple-application containers include a preservative but care should nevertheless be taken to avoid contamination of the contents during use. Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated).

Eye drops for use in hospital wards are normally discarded 1 week after first opening. Individual containers should be provided for each patient. A separate bottle should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue eye-drop bottles that have been dispensed to the patient on the day of discharge.

In out-patient departments single-application packs should preferably be used; if multiple-application packs are used, they should be discarded at the end of each day. In clinics for eye diseases and in accident and emergency departments, where the dangers of infection are high, single-application packs should be used; if a multiple-application pack is used, it should be discarded after single use.

Diagnostic dyes (e.g. fluorescein) should be used only from single-application packs. Eye drops in multiple-application containers include a preservative but should not be used for more than 4 weeks after first opening (unless otherwise stated).

Eye drops for use in hospital wards are normally discarded 1 week after first opening. Individual containers should be provided for each patient. A separate bottle should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue eye-drop bottles that have been dispensed to the patient on the day of discharge.

Diagnostic dyes (e.g. fluorescein) should be used only from single-application packs.

In eye surgery single-application containers should be used if possible; if a multiple-application pack is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not suitable for this purpose. For all surgical procedures, a previously unopened container is used for each patient.

11.3 Anti-infective eye preparations

11.3.1 Antibacterials

Eye infections Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial blepharitis is treated by application of an antibiotic eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after cultivating organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibiotic eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis. Gonococcal conjunctivitis is treated with systemic and topical antibacterials.

Corneal ulcer and keratitis require specialist treatment and may call for hospital admission for intensive therapy.

Endophthalmitis is a medical emergency which also calls for specialist management and often requires per-enteral, subconjunctival, or intra-ocular administration of antimicrobials.

11.3.2 Antifungals

11.3.3 Antivirals

Eye infections Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial blepharitis is treated by application of an antibiotic eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after cultivating organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibiotic eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis. Gonococcal conjunctivitis is treated with systemic and topical antibacterials.

Corneal ulcer and keratitis require specialist treatment and may call for hospital admission for intensive therapy.

Endophthalmitis is a medical emergency which also calls for specialist management and often requires per-enteral, subconjunctival, or intra-ocular administration of antimicrobials.

11.3.1 Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol has a broad spectrum of activity and is the drug of choice for superficial eye infections. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin, levofloxacin, moxifloxacin, and ofloxacin; the aminoglycosides, gentamicin, neomycin [unlicensed], and tobramycin are also active against a wide variety of bacteria. Gentamicin, quinolones (except moxifloxacin), and polymyxin B are effective for infections caused by Pseudomonas aeruginosa.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Trachoma which results from chronic infection with Chlamydia trachomatis can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamidine isetionate is of little value in bacterial infections but is specific for the rare but potentially sight-threatening condition of acanthamoeba keratitis [unlicensed indication] (see also section 11.9).

With corticosteroids Many antibiotic preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose (section 11.4).

Administration Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibiotic eye preparations are usually administered as follows:
**11 Eye**

**FUSIDIC ACID**

**Indications** see notes above

**Dose**
- See under preparation below

**Fucithalmic** (LEO)

Eye drops, m/t, fusidic acid 1% in gel basis (liquifies on contact with eye). Net price 5 g = £1.96

Excipients include benzalkonium chloride, disodium edetate

**Dose** apply twice daily

**GENTAMICIN**

**Indications** see notes above

**Dose**
- See Administration in notes above

**Gentamicin** (Amidpharm)

Drops (for ear or eye), gentamicin 0.3% (as sulphate). Net price 10 mL = £2.13

Excipients include benzalkonium chloride

**LEVOFLOXACIN**

**Indications** see notes above

**Cautions** not recommended for children under 1 year

**Pregnancy** manufacturer advises avoid—systemic quinolones have caused arthropathy in animal studies

**Breast-feeding** manufacturer advises avoid

**Side-effects** transient ocular irritation, visual disturbances, lid margin crusting, lid or conjunctival oedema, hyperaemia, conjunctival follicles, photophobia, headache, rhinitis

**Dose**
- See Administration in notes above

**Oftaquix** (Kestrel Ophthalmics)

Eye drops, levofloxacin 0.5%, net price 5 mL = £6.95

Excipients include benzalkonium chloride

**Eye drops** levofloxacin 0.5%, net price 30 x 0.5-mL single use units = £17.95

**MOXIFLOXACIN**

**Indications** see notes above

**Cautions** not recommended for neonates

**Side-effects** taste disturbances, ocular discomfort (including pain, irritation and dryness), hyperaemia; less commonly vomiting, headache, paraesthesia, corneal disorders (including keratitis, erosion, and staining), conjunctival haemorrhage, eyelid erythema, visual disturbances, nasal discomfort, pharyngolaryngeal pain; also reported: nausea, palpitation, dyspnoea, dizziness, raised intra-ocular pressure, photophobia, rash, pruritus

**Dose**
- **ADULT** and **CHILD** over 1 month, apply 3 times daily (continue treatment for 2–3 days after infection clears; review if no improvement within 5 days)

**Moxivig** (Alcon)

Eye drops, moxifloxacin (as hydrochloride) 0.5%. Net price 5 mL = £9.80

**NEOMYCIN SULPHATE**

**Indications** see notes above

**Dose**
- See Administration in notes above

**Redidrops** (eye drops), chloramphenicol 0.5%. Net price 0.5 mL = £9.17

**Net** price 3.5 g = £5.22

**Side-effects** transient stinging; see also notes above

**Excipients** include benzalkonium chloride, disodium edetate

**Redidrops** (eye drops), chloramphenicol 0.5%. Net price 5 mL = £4.70

**Excipients** include benzalkonium chloride, disodium edetate

**Redidrops** (eye drops), chloramphenicol 0.5%. Net price 10 mL = £9.80

**Excipients** include benzalkonium chloride, disodium edetate

**Ophthalmic solution** (eye drops), ciprofloxacin (as hydrochloride) 0.3%. Net price 5 mL = £4.70

**Excipients** include benzalkonium chloride

**Eye ointment**, ciprofloxacin (as hydrochloride) 0.3%. Net price 3.5 g = £5.22

**Chloramphenicol**

**Indications** see notes above

**Side-effects** transient burning and itching; lid margin crusting; hyperaemia; taste disturbances; corneal staining, keratitis, lid oedema, lacrimation, photophobia, corneal infiltrates; nausea and visual disturbances reported

**Dose**
- Superficial bacterial infection, see Administration in notes above
- Corneal ulcer, apply **eye drops** throughout day and night, day 1 apply every 15 minutes for 6 hours then every 30 minutes, day 2 apply every hour, days 3–14 apply every 4 hours (max. duration of treatment 21 days)

Apply **eye ointment** throughout day and night; apply 1.25 cm ointment every 1–2 hours for 2 days then every 4 hours for next 12 days

**Ciloxan** (Alcon)

**Ophthalmic solution** (= eye drops), ciprofloxacin (as hydrochloride) 0.3%. Net price 5 mL = £4.70

**Excipients** include benzalkonium chloride

**Eye ointment**, ciprofloxacin (as hydrochloride) 0.3%. Net price 3.5 g = £5.22

**Excipients** include benzalkonium chloride

**NEOMYCIN SULPHATE**

**Indications** see notes above

**Dose**
- See Administration in notes above

**Redidrops** (eye drops), chloramphenicol 0.5%. Net price 20 x 0.5 mL = £9.17

**Ciprofloxacin**

**Indications** superficial bacterial infections, see notes above; corneal ulcers

**Cautions** not recommended for children under 1 year

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk
**11.3.2 Antifungals**

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411 or www.moorfields.nhs.uk).

Antifungal preparations may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection; they can be identified by appropriate laboratory procedures.

**OFLOXACIN**

**Indications** see notes above

**Pregnancy** manufacturer advises use only if benefit outweighs risk; systemic quinolones have caused arthropathy in animal studies

**Breast-feeding** manufacturer advises avoid

**Side-effects** local irritation including photophobia; dizziness, numbness, nausea and headache reported

**Dose**
- Apply every 2–4 hours for the first 2 days then reduce frequency to 4 times daily (max. 10 days treatment)

**Exocin**® (Allergan)™

**Ophthalmic solution** (= eye drops), ofloxacin 0.3%.

Net price 5 mL = £2.17

Excipients include benzalkonium chloride

**POLIMYXIN B SULPHATE**

**Indications** see notes above

**Side-effects** local irriation and dermatitis

**Dose**
- See Administration in notes above

**With other antibacterials**

**Polyfax**® (TEVA UK)™

**Eye ointment**, polymyxin B sulphate 10 000 units, bacitracin zinc 500 units/g. Net price 4 g = £3.26

**PROPAMIDINE ISETIONATE**

**Indications** local treatment of infections (but see notes above)

**Dose**
- See preparations

**Brolene**® (Sanofi-Aventis)

**Eye drops**, propamidine isetionate 0.1%. Net price 10 mL = £2.80

Excipients include benzalkonium chloride

**Dose** apply 4 times daily

**Note** Eye drops containing propamidine isetionate 0.1% also available from Typharm (Golden Eye Drops)

**Eye ointment**, dibrompropamidine isetionate 0.15%. Net price 5 g = £2.92

**Dose** apply 1–2 times daily

**Note** Eye ointment containing dibrompropamidine isetionate 0.15% also available from Typharm (Golden Eye Ointment)

**TOBRAMYCIN**

**Indications** see notes above

**Dose**
- **ADULT and CHILD** over 1 year, apply twice daily for 6–8 days; in severe infection, apply 4 times daily on the first day, then twice daily for 5–7 days

**Tobramycin**® (Alcon)™

**Eye drops**, tobramycin 0.3%, net price 5 mL = £4.74

Excipients include benzalkonium chloride

**GANCICLOVIR**

**Indications** local treatment of herpes simplex infections

**Side-effects** burning sensation, tingling, superficial punctate keratitis

**Dose**
- Apply 5 times daily until healing complete, then apply 3 times daily for a further 7 days

**Zovirax**® (GSK)™

**Eye ointment**, aciclovir 3%. Net price 4.5 g = £9.34

**11.3.3 Antivirals**

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with **aciclovir** or **ganciclovir**. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster (section 5.3.2).

Slow-release ocular implants containing ganciclovir (available on a named-patient basis from specialist importing companies, see p. 988) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. For systemic treatment of CMV retinitis, see section 5.3.2.2.

**ACICLOVIR**

(Acylovir)

**Indications** local treatment of herpes simplex infections

**Side-effects** local irritation and inflammation, superficial punctate keratopathy; rarely blepharitis; very rarely hypersensitivity reactions including angioedema

**Dose**
- Apply 5 times daily (continue for at least 3 days after complete healing)

**Zovirax**® (GSK)™

**Eye ointment**, aciclovir 3%. Net price 4.5 g = £9.34

**GANCICLOVIR**

**Indications** local treatment of herpes simplex infections

**Side-effects** burning sensation, tingling, superficial punctate keratitis

**Dose**
- Apply 5 times daily until healing complete, then apply 3 times daily for a further 7 days

**Virgan®** (Spectrum Thea)™

**Ophthalmic gel**, ganciclovir 0.15%, net price 5 g = £19.99
### 11.4 Corticosteroids and other anti-inflammatory preparations

#### 11.4.1 Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

**Topical corticosteroids** are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- A ‘red eye’, when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard.
- ‘Steroid glaucoma’ can follow the use of corticosteroid eye preparations in susceptible individuals;
- A ‘steroid cataract’ can follow prolonged use.

Other side-effects of ocular corticosteroids include thinning of the cornea and sclera. Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

Systemic corticosteroids (section 6.3.2) may be useful for ocular conditions. The risk of producing a ‘steroid cataract’ increases with the dose and duration of corticosteroid use.

#### BETAMETHASONE

**Indications**  local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- Apply eye drops every 30–60 minutes until controlled then reduce frequency to 4–6 times daily

**Maxidex** *(Alcon)*

Eye drops, dexamethasone 0.1%, hypromellose 0.5%.

- Net price 5 mL = £1.42; 10 mL = £2.80

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Single use**

**Minims**® Dexamethasone *(Bausch & Lomb)*

Eye drops, dexamethasone sodium phosphate 0.1%.

- Net price 20 × 0.5 mL = £9.38

**Excipients** include disodium edetate

**With antibacterials**

**Maxitrol** *(Alcon)*

Eye drops, dexamethasone 0.1%, neomycin 0.35% (as sulphate), polymyxin B sulphate 6000 units/mL.

- Net price 5 mL = £1.68

**Excipients** include benzalkonium chloride, polysorbate 20

Eye ointment, dexamethasone 0.1%, neomycin 0.35% (as sulphate), polymyxin B sulphate 6000 units/g.

- Net price 3.5 g = £1.44

**Excipients** include hydroxybenzoates (parabens), wool fat

**Dose** apply 3–4 times daily or at night when used with eye drops

**Sofradex** *(Sanofi-Aventis)*

Eye drops, dexamethasone 0.1%, tobramycin 0.3%.

- Net price 5 mL = £5.37

**Excipients** include benzalkonium chloride, disodium edetate

#### FLUOROMETHOLONE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- Apply every hour for 24–48 hours then reduce frequency to 2–4 times daily

**FML** *(Allergan)*

**Ophthalmic suspension** (= eye drops), fluorometholone 0.1%, polyvinyl alcohol *(Liquifilm)* 1.4%.

- Net price 5 mL = £1.71; 10 mL = £2.95

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

#### HYDROCORTISONE ACETATE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- Apply every hour for 24–48 hours then reduce frequency to 2–4 times daily

**Hydrocortisone** *(Non-proprietary)*

Eye drops, hydrocortisone acetate 1%. Net price 10 mL = £3.21

Eye ointment, hydrocortisone acetate 0.5%, net price 3 g = £2.86; 1%, 3 g = £6.71
LOTEPREDNOL ETABONATE

Indications  treatment of post-operative inflammation following ocular surgery
Cautions  see notes above
Side-effects  see notes above
Dose  
- Apply 4 times daily starting 24 hours after surgery; max. duration of treatment 14 days

Lotemax® (Bausch & Lomb) ▼
Ophthalmic suspension (eye drops), loteprednol etabonate 0.5%, net price 10 mL = £1.92
Excipients include benzalkonium chloride, disodium edetate

PREDNISOLONE

Indications  local treatment of inflammation (short-term)
Cautions  see notes above
Side-effects  see notes above
Dose  
- Apply every 1–2 hours until controlled then reduce frequency

Predsol® (UCB Pharma) ▼
Drops (for ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £1.92
Excipients include benzalkonium chloride, disodium edetate

Pred Forte® (Allergan) ▼
Eye drops, prednisolone acetate 1%. Net price 5 mL = £1.52, 10 mL = £3.05
Excipients include benzalkonium chloride, disodium edetate, polysorbate 80

Dose  
- By intravitreal injection, 700 micrograms into the affected eye

Note  Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature

Dexumethasone

Indications  see notes above—specialist use only
Cautions  monitor intra-ocular pressure and for signs of ocular infection; history of ocular herpes simplex; aphasis; retinal vein occlusion with significant retinal ischaemia; concomitant administration of anticoagulant or antiplatelet drugs
Contra-indications  active or suspected ocular or periocular infection; uncontrolled advanced glaucoma
Pregnancy  manufacturer advises avoid unless potential benefit outweighs risk—no information available
Breast-feeding  manufacturer advises avoid unless potential benefit outweighs risk—no information available
Side-effects  raised intra-ocular pressure, vitreous detachment, cataract, visual disturbance; less commonly headache; also reported glaucoma, ocular infection

Dose  
- By intravitreal injection, 700 micrograms into the affected eye

Note  Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature

Ozurdex® (Allergan) ▼
Intravitreal implant, dexamethasone 700 micrograms in disposable applicator; net price = £870.00

11.4.2 Other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide, and sodium cromoglicate.

Eye drops containing antihistamines, such as antazoline (with xylometazoline as Otrivine-Antistin®), azelastine, epinastine, ketotifen, and olopatadine, can be used for allergic conjunctivitis.

Sodium cromoglicate (sodium cromoglicate) and nedocromil sodium eye drops can be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Diclofenac eye drops (section 11.8.2) and emedastine eye drops are also licensed for seasonal allergic conjunctivitis.

ANTAZOLINE SULPHATE

Indications  allergic conjunctivitis

Otrivine-Antistin® (Novartis Consumer Health)
Eye drops, antazoline sulphate 0.5%, xylometazoline hydrochloride 0.05%. Net price 10 mL = £2.35
Excipients include benzalkonium chloride, disodium edetate

Note  Xylometazoline is a sympathomimetic; it should be used with caution in patients susceptible to angle-closure glaucoma; absorption of antazoline and xylometazoline may result in systemic side-effects and the possibility of interaction with other drugs.
### AZELASTINE HYDROCHLORIDE

**Indications** allergic conjunctivitis  
**Side-effects** mild transient irritation; bitter taste reported  
**Dose**  
- Seasonal allergic conjunctivitis, **ADULT** and **CHILD** over 4 years, apply twice daily; increased if necessary to 4 times daily  
- Perennial conjunctivitis, **ADULT** and **CHILD** over 12 years, apply twice daily; increased if necessary to 4 times daily; max. duration of treatment 6 weeks  

**Optilast**® (Meda) *N*  
Eye drops, azelastine hydrochloride 0.05%. Net price 8 mL = £6.40  
**Excipients** include benzalkonium chloride, disodium edetate

### EMEDESTINE

**Indications** seasonal allergic conjunctivitis  
**Side-effects** transient burning or stinging; blurred vision, local oedema, keratitis, irritation, dry eye, lacrimation, corneal infiltrates (discontinue) and staining; photophobia; headache, and rhinitis occasionally reported  
**Dose**  
- **ADULT** and **CHILD** over 3 years, apply twice daily  

**Emadine**® (Alcon) *N*  
Eye drops, emedastine 0.05% (as difumarate), net price 5 mL = £7.31  
**Excipients** include benzalkonium chloride

### EPINASTINE HYDROCHLORIDE

**Indications** seasonal allergic conjunctivitis  
**Side-effects** burning; *less commonly* dry mouth, taste disturbance; nasal irritation, rhinitis; headache, blepharoconjunctivitis, conjunctival oedema and hyperaemia, dry eye, local irritation, photophobia, visual disturbance; pruritus  
**Dose**  
- **ADULT** and **ADOLESCENT** over 12 years, apply twice daily; max. duration of treatment 8 weeks  

**Relestat**® (Allergan) *N*  
Eye drops, epinastine hydrochloride 500 micrograms/mL, net price 5 mL = £9.90  
**Excipients** include benzalkonium chloride, disodium edetate

### KETOTIFEN

**Indications** seasonal allergic conjunctivitis  
**Side-effects** burning or stinging, punctate corneal epithelial erosion; *less commonly* dry eye, subconjunctival haemorrhage, photophobia; headache, dryness, skin reactions, and dry mouth also reported  
**Dose**  
- **ADULT** and **CHILD** over 3 years, apply twice daily  

**Zaditen**® (Novartis) *N*  
Eye drops, ketotifen (as fumarate) 250 micrograms/mL, net price 5 mL = £7.80  
**Excipients** include benzalkonium chloride

### LODOXAMIDE

**Indications** allergic conjunctivitis  
**Side-effects** burning, stinging, itching; blurred vision; tear production disturbance, and ocular discomfort; *less commonly* flushing, nasal dryness, dizziness, dryness, headache, blepharitis and keratitis  
**Dose**  
- **ADULT** and **CHILD** over 4 years, apply 4 times daily; improvement of symptoms may sometimes require treatment for up to 4 weeks  

**Alomide**® (Alcon) *N*  
**Ophthalmic solution** (eye drops), lodoxamide 0.1% (as trometamol). Net price 10 mL = £5.21  
**Excipients** include benzalkonium chloride, disodium edetate  
**Note** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years

### NEDOCROMIL SODIUM

**Indications** allergic conjunctivitis; seasonal keratoconjunctivitis  
**Side-effects** burning and stinging; distinctive taste reported  
**Dose**  
- Seasonal and perennial conjunctivitis, **ADULT** and **CHILD** over 6 years, apply twice daily increased if necessary to 4 times daily; max. 12 weeks treatment for seasonal allergic conjunctivitis  
- Seasonal keratoconjunctivitis, **ADULT** and **CHILD** over 4 years, apply 4 times daily  

**Rapitil**® (Sanofi-Aventis) *N*  
Eye drops, nedocromil sodium 2%. Net price 5 mL = £4.92  
**Excipients** include benzalkonium chloride, disodium edetate

### OLOPATADINE

**Indications** seasonal allergic conjunctivitis  
**Side-effects** local irritation; *less commonly* keratitis, dry eye, local oedema, photophobia; headache, asthenia, dizziness; dry nose also reported  
**Dose**  
- **ADULT** and **CHILD** over 3 years, apply twice daily; max. duration of treatment 4 months  

**Opatanol**® (Alcon) *N*  
Eye drops, olopatadine (as hydrochloride) 1 mg/mL, net price 5 mL = £3.91  
**Excipients** include benzalkonium chloride

### SODIUM CROMOGlicate

**Indications** allergic conjunctivitis; seasonal keratoconjunctivitis  
**Side-effects** burning and stinging  
**Dose**  
- **ADULT** and **CHILD** apply eye drops 4 times daily  

**Sodium Cromoglicate (Non-proprietary)** *N*  
**Eye drops**, sodium cromoglicate 2%. Net price 13.5 mL = £1.79  
Brands include Hay-Crom® *Aqueous*, Opticrom® *Aqueous*, Vivadren®  
**Note** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis
Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action. Short-acting, relatively weak mydriatics, such as tropicamide 0.5% (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Cyclopentolate 1% (action up to 24 hours) or atropine (action up to 7 days) are preferable for producing cycloplegia for refraction in young children. Atropine ointment 1% is sometimes preferred for children aged under 5 years because the ointment formulation reduces systemic absorption. Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids (section 11.4.1). Atropine is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm, often in combination with phenylephrine eye drops; cyclopentolate or homatropine (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

Phenylephrine is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours. Phenylephrine 10% drops are contra-indicated in children and the elderly owing to the risk of systemic effects.

Cautions Darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. Mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber. Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors; other interactions: Appendix 1 (sympathomimetics).

Driving Patients should be warned not to drive until vision is clear after mydriasis.

Side-effects Ocular side-effects of mydriatics and cycloplegics include transient stinging and raised intra-ocular pressure; on prolonged administration, local irritation, hyperaemia, oedema and conjunctivitis can occur. Contact dermatitis can occur with the antimuscarinic mydriatic drugs, especially atropine. Systemic side-effects of atropine and cyclopentolate can occur, particularly in children and the elderly; see section 1.2 for systemic side-effects of antimuscarinic drugs.

Antimuscarinics

ATROPINE SULPHATE

Indications mydriasis; see also notes above
Cautions risk of systemic effects with eye drops in infants under 3 months—eye ointment preferred; see also notes above
Side-effects see notes above

Side-effects

Minims® Atropine Sulphate (Bausch & Lomb) 
Eye drops, atropine sulphate 0.5%. Net price 20 × 0.5 mL = £12.71

Minims® Cyclopentolate Hydrochloride (Bausch & Lomb) 
Eye drops, cyclopentolate hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.64

Tropicamide

Indications see notes above
Cautions see notes above
Side-effects see notes above

Minims® Tropicamide (Bausch & Lomb) 
Eye drops, tropicamide 0.5%. Net price 5 mL = £1.29; 1%, 5 mL = £1.60

Excipients include benzalkonium chloride, disodium edetate

Phenylephrine Hydrochloride

Indications mydriasis; see also notes above
Cautions children and elderly (avoid 10% strength); cardiovascular disease (avoid or use 2.5% strength only); tachycardia; hyperthyroidism; diabetes; see also notes above
Side-effects eye pain and stinging; blurred vision, photophobia; systemic effects include palpitations, arrhythmias, hypertension, coronary artery spasm; very rarely angle-closure glaucoma

Side-effects

Minims® Phenylephrine Hydrochloride 10%. Net price 10 mL = £4.86
11.6 Treatment of glaucoma

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The commonest form of glaucoma is primary open-angle glaucoma (chronic simple glaucoma; wide-angle primary angle-closure glaucoma). The condition is often asymptomatic and the patient may present with significant loss of visual-field. Primary angle-closure glaucoma (acute closed-angle glaucoma, narrow-angle glaucoma) results from blockage of aqueous humour flow into the anterior chamber and is a medical emergency.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice. It may be necessary to combine these drugs or add others, such as miotics, sympathomimetics, or carbonic anhydrase inhibitors, to control intra-ocular pressure.

For urgent reduction of intra-ocular pressure and before surgery, mannitol 20% (up to 500 mL) is given by slow intravenous infusion until the intra-ocular pressure has been satisfactorily reduced. Acetazolamide by intravenous infusion is required after iridotomy, iridectomy, or a drainage operation in either primary open-angle or primary angle-closure glaucoma.

Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary open-angle glaucoma, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol, carteolol, levobunolol, metipranolol, and timolol.

Cautions, contra-indications, and side-effects

Systemic absorption can follow topical application to the eyes; therefore, eye drops containing a beta-blocker are contra-indicated in patients with bradycardia, heart block, or uncontrolled heart failure. Important: for a warning to avoid in asthma see below. Consider also other cautions, contra-indications, and side-effects of beta-blockers (p. 97). Local side-effects of eye drops include ocular stinging, burning, pain, itching, erythema, dry eyes and allergic reactions including anaphylaxis and blepharoconjunctivitis, occasionally corneal disorders have been reported. Important: Beta-blockers, even those with apparent cardios-lectivity, should not be used in patients with asthma or a history of obstructive airways disease, unless no alternative treatment is available. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

Interactions

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind. See also Appendix 1 (beta-blockers).

BETAXOLOL HYDROCHLORIDE

Indications see notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

• Apply twice daily

Betaxolol (Non-proprietary)

Eye drops, solution, betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90

Excipients may include benzalkonium chloride, disodium edetate

Betoptic® (Alcon)

Ophthalmic solution (= eye drops), betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90

Excipients include benzalkonium chloride, disodium edetate

Ophthalmic suspension (= eye drops), betaxolol (as hydrochloride) 0.25%, net price 5 mL = £2.66

Excipients include benzalkonium chloride, disodium edetate

Unit dose eye drop suspension, betaxolol (as hydrochloride) 0.25%, net price 50 × 0.25 mL = £13.77

CARTEOLOL HYDROCHLORIDE

Indications see notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

• Apply twice daily

Teoptic® (Spectrum Thea)

Eye drops, carteolol hydrochloride 1%, net price 5 mL = £7.60; 2%, 5 mL = £8.40

Excipients include benzalkonium chloride

LEVUBUNOLOL HYDROCHLORIDE

Indications see notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; anterior uveitis occasionally reported

Dose

• Apply once or twice daily

Levobunolol (Non-proprietary)

Eye drops, levobunolol hydrochloride 0.5%, net price 5 mL = £3.05

Betagan® (Allergan)

Eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (Liquifilm®) 1.4%. Net price 5-mL = £1.85

Excipients include benzalkonium chloride, disodium edetate, sodium metabisulphite

Unit dose eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (Liquifilm®) 1.4%. Net price 30 × 0.4 mL = £9.96

Excipients include disodium edetate
**METIPRANOLOL**

**Indications** see notes above but in chronic open-angle glaucoma restricted to patients allergic to preservatives or to those wearing soft contact lenses (in whom benzalkonium chloride should be avoided)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; granulomatous anterior uveitis reported (discontinue treatment)

**Dose**
- Apply twice daily

**Minims** Metipranolol (Bausch & Lomb) 

Eye drops, metipranolol 0.1%, net price 20 × 0.5 mL = £11.77

**TIMOLOL MALEATE**

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

**Dose**
- Apply twice daily; long-acting preparations, apply once daily

**Timolol** (Non-proprietary)

Eye drops, timolol (as maleate) 0.25%, net price 5 mL = £1.56; 0.5%, net price 5 mL = £1.56

**Timoptol** (MSD)

Eye drops, in Ocumeter metered-dose unit, timolol (as maleate) 0.25%, net price 5 mL = £3.12; 0.5%, 5 mL = £3.12

Excipients include benzalkonium chloride

Unit dose eye drops, timolol (as maleate) 0.25%, net price 30 × 0.2 mL = £8.45; 0.5%, 30 × 0.2 mL = £9.65

**Once-daily preparations**

**Nyogel** (Novartis)

Eye gel (= eye drops), timolol (as maleate) 0.1%, net price 5 g = £2.85

Excipients include benzalkonium chloride

Dose apply once daily

**Timoptol-**LA (MSD)

Ophthalmic gel-forming solution (= eye drops), timolol (as maleate) 0.25%, net price 2.5 mL = £3.12; 0.5%, 2.5 mL = £3.12

Excipients include benzalkonium bromide

Dose apply once daily

- **With bimatoprost**
  - See under Bimatoprost
- **With brimonidine**
  - See under Brimonidine
- **With brinzolamide**
  - See under Brinzolamide
- **With dorzolamide**
  - See under Dorzolamide
- **With latanoprost**
  - See under Latanoprost
- **With travoprost**
  - See under Travoprost

**Prostaglandin analogues and prostamides**

The prostaglandin analogues latanoprost, tafluprost, and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

**Cautions** Before initiating treatment, patients should be monitored for possible change in eye colour since an increase in the brown pigment in the iris may occur; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Use with caution in patients with aphakia, pseudophakia with torn posterior lens capsule or anterior chamber lenses, and in those with known risk factors for cystoid macular oedema, iritis, or uveitis. Care is also needed in patients with brittle or severe asthma. Do not use within 5 minutes of thiomersal-containing preparations. For use in contact lens wearers see Contact Lenses, p. 684.

**Side-effects** Side-effects of prostaglandin analogues and prostamides include brown pigmentation particularly in those with mixed-colour irides, blepharitis, ocular irritation and pain, conjunctival hyperaemia, transient punctate epithelial erosion, skin rash, dry eyes, headache, and photophobia; they may also cause, darkening, thickening and lengthening of eye lashes. Less frequent side-effects include eyelid oedema and rash, keratitis, blurred vision, and conjunctivitis. There have been rare reports of dyspnoea, exacerbation of asthma, dizziness, arthralgia, myalgia, iritis, uveitis, local oedema, darkening of palpebral skin. Very rarely chest pain, palpitations, and exacerbation of angina has also been reported.

**BIMATOPROST**

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above

**Hepatic impairment** use with caution in moderate to severe impairment—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see notes above; also nausea, asthenia, hypertension

**Dose**
- Apply once daily, preferably in the evening; CHILD under 18 years, not recommended

**Lumigan** (Allergan)

Eye drops, bimatoprost 0.01% micrograms/mL, net price 3 mL = £12.43, triple pack (3 × 3 mL) = £37.29; 0.03% micrograms/mL, 3 mL = £10.30, triple pack (3 × 3 mL) = £30.90

Excipients include benzalkonium chloride

- **With timolol**
  - For prescribing information on timolol, see section 11.6, Beta-blockers

**Ganfort** (Allergan)

Eye drops, bimatoprost 0.03% micrograms/mL, timolol (as maleate) 5 mg/mL, net price 3 mL = £13.95

Excipients include benzalkonium chloride

- **With latanoprost**
  - See under Latanoprost
- **With travoprost**
  - See under Travoprost

**11.6 Treatment of glaucoma**

- **TIMOLOL MALEATE**
- **BIMATOPROST**
- **Prostaglandin analogues and prostamides**

**Latanoprost**

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above, also in cataract surgery

**Pregnancy** manufacturer advises avoid

**Breast-feeding** may be present in milk—manufacturer advises avoid

**Side-effects** see notes above

**Dose**

- Apply once daily, preferably in the evening; CHILD under 18 years, not recommended

**Xalatan®** (Pharmacia) [58]

**Eye drops**; latanoprost 50 micrograms/mL, net price 2.5 mL = £12.48

Excipients include benzalkonium chloride

**With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**Xalacom®** (Pharmacia) [58]

**Eye drops**; latanoprost 50 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £14.32

Excipients include benzalkonium chloride

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker alone not adequate; apply once daily

**Tafluprost**

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above

**Hepatic impairment** use with caution—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see notes above

**Dose**

- Apply once daily, preferably in the evening; CHILD under 18 years, not recommended

**Saflutan®** (MSD) [58]

**Unit dose eye drops**, tafluprost 15 micrograms/mL, net price 30 × 0.3 mL = £17.41

**Travatan®** (Alcon) [58]

**Eye drops**; travoprost 40 micrograms/mL, net price 2.5 mL = £9.98

**With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**DuoTrav®** (Alcon) [58]

**Eye drops**; travoprost 40 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £12.54

Excipients include benzalkonium chloride, disodium edetate

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate; apply once daily; CHILD and ADOLESCENT under 18 years, not recommended

**Sympathomimetics**

**Brimonidine**

A selective alpha2-adrenoceptor agonist, is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy.

Apraclonidine (section 11.8.2) is another alpha2-adrenoceptor agonist. Eye drops containing apraclonidine 0.5% are used for a short term to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

**Brimonidine Tartrate**

**Indications** raised intra-ocular pressure, see notes above

**Cautions** severe cardiovascular disease; cerebral or coronary insufficiency; Raynaud’s syndrome, thromboangiitis obliterans, postural hypotension, depression; children 2–12 years (increased risk of drowsiness); interactions: Appendix 1 (brimonidine)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** neonate or child under 2 years

**Hepatic impairment** manufacturer advises use with caution

**Renal impairment** manufacturer advises use with caution

**Pregnancy** manufacturer advises use only if benefit outweighs risk

**Breast-feeding** manufacturer advises avoid

**Side-effects** dry mouth, gastro-intestinal disturbances, taste disturbances, upper respiratory symptoms, headache, drowsiness, dizziness, malaise, ocular disturbances (including hyperaemia, burning, stinging, pruritus, pain and dryness), visual disturbances, eyelid inflammation, photophobia, corneal erosion and staining, conjunctival disturbances (including Blanching, follicles, and infection); less commonly palpitation, arrhythmia, bradycardia, tachycardia, depression, nasal dryness; rarely dyspnoea, very rarely hypertension, hypotension, syncope, insomnia, irritis, miosis

**Dose**

- Apply twice daily
11.6 Treatment of glaucoma 677

Brimonidine Tartrate (Non-proprietary) \(\text{A}\)  
**Eye drops**, brimonidine tartrate 0.2%, net price 5 mL = £6.55  
*Brands* include *Brymol*®  
*Excipients* may include benzalkonium chloride  
**Alphagan®** (Allergan) \(\text{A}\)  
**Eye drops**, brimonidine tartrate 0.2%, net price 5 mL = £6.85  
*Excipients* include benzalkonium chloride  

\[\text{With timolol}\]

For prescribing information on timolol, see section 11.6, Beta-blockers  
**Combigan®** (Allergan) \(\text{A}\)  
**Eye drops**, brimonidine tartrate 0.2%, timolol (as maleate) 0.5%, net price 5 mL = £10.00  
*Excipients* include benzalkonium chloride  

**Dose**  
For raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate, apply twice daily  

**Carbonic anhydrase inhibitors and systemic drugs**

The carbonic anhydrase inhibitors, acetazolamide, brinzolamide, and dorzolamide, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use also produces weak diuresis.  
**Acetazolamide** is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is a sulphonamide; blood disorders, rashes, and other sulphonamide-related side-effects occur occasionally; patients should be told to report any unusual skin rash. It is not generally recommended for long-term use; electrolyte disturbances and metabolic acidosis that occur can be corrected by administering potassium bicarbonate (as effervescent potassium tablets, section 9.2.1.3).  
**Dorzolamide** and **brinzolamide** are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Systemic absorption can rarely cause sulphonamide-like side-effects and may require discontinuation if severe.  
**The osmotic diuretics**, intravenous hypertonic mannitol (section 2.2.5) or glycerol by mouth are useful short-term ocular hypotensive drugs.  

**ACETAZOLAMIDE**

**Indications**  
reduction of intra-ocular pressure in open-angle glaucoma, secondary glaucoma, and peri-operative in angle-closure glaucoma; diuresis (section 2.2.7); epilepsy  
**Cautions**  
not generally recommended for prolonged use but if given monitor blood count and plasma-electrolyte concentration; pulmonary obstruction and impaired alveolar ventilation (risk of acidosis); elderly; diabetes mellitus; renal calculi; avoid extravasation at injection site (risk of necrosis);  
*interactions*: Appendix 1 (diuretics)  
**Contra-indications**  
hypokalaemia, hypotraemia, hyperchloremic acidosis, adenocortical insufficiency; long-term administration in chronic angle-closure glaucoma; sulfonamide hypersensitivity  
**Hepatic impairment** manufacturer advises avoid  

**Renal impairment** avoid—risk of metabolic acidosis  
**Pregnancy** manufacturer advises avoid, especially in first trimester (toxicity in animal studies)  
**Breast-feeding** amount too small to be harmful  
**Side-effects** see notes above; also nausea, vomiting, diarrhoea, taste disturbance, loss of appetite, paraesthesia, flushing, headache, dizziness, fatigue, irritability, excitement, ataxia, depression; thirst, polyuria, reduced libido, less commonly melena, drowsiness, confusion, hearing disturbances, fever, glycosuria, metabolic acidosis and electrolyte disturbances on long-term therapy, haematuria, crystalluria, renal and ureteric colic, renal lesions or calculi, renal failure, blood disorders, bone marrow suppression, rash (including Stevens-Johnson syndrome and toxic epidermal necrosis); rarely fulminant hepatic necrosis, hepatitis, cholestatic jaundice, flaccid paralysis, convulsions, photosensitivity; also reported transient myopia  

**Dose**

- Glaucoma, by mouth or by intravenous injection, 0.25–1 g daily in divided doses  
- Epilepsy, by mouth or by intravenous injection, 0.25–1 g daily in divided doses; *CHILD* 6–30 mg/kg/day, max. 750 mg/day  
*Note* Dose by intramuscular injection, as for intravenous injection but preferably avoided because of alkalinity  

**Diamox®** (Goldshield) \(\text{A}\)  
**Tablets**, acetazolamide 250 mg. Net price 112-tab pack = £12.68. Label: 3  
**Sodium Parenteral (= injection)**, powder for reconstitution, acetazolamide (as sodium salt). Net price 500-mg vial = £14.76  
**Modified release**  
**Diamox® SR** (Goldshield) \(\text{A}\)  
**Capsules**, m/r, orange, enclosing orange f/c pellets, acetazolamide 250 mg. Net price 30-cap pack = £13.88. Label: 3, 25  
*Dose* glaucoma, 1–2 capsules daily  

**BRINZOLAMIDE**

**Indications**  
adjunct to beta-blockers or used alone in raised intra-ocular pressure in ocular hypertension and in open-angle glaucoma if beta-blocker alone inadequate or inappropriate  
**Cautions** systemic absorption follows topical application;  
*interactions*: Appendix 1 (brinzolamide)  
**Contra-indications** hyperchloremic acidosis  
**Hepatic impairment** manufacturer advises avoid  
**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²  
**Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies  
**Breast-feeding** manufacturer advises avoid  
**Side-effects** local irritation, taste disturbance; less commonly nausea, dyspepsia, dry mouth, chest pain, epistaxis, haemoptysis, dyspnoea, rhinitis, pharyngitis, bronchitis, paraesthesia, depression, dizziness, headache, dermatitis, alopecia, corneal erosion  
**Dose**

- Apply twice daily increased to 3 times daily if necessary  
**Azopt®** (Alcon) \(\text{A}\)  
**Eye drops**, brinzolamide 10 mg/mL, net price 5 mL = £6.56  
*Excipients* include benzalkonium chloride, disodium edetate
DORZOLAMIDE

**Indications** raised intra-ocular pressure in ocular hypertension, open-angle glaucoma, pseudo-exfoliative glaucoma either as adjunct to beta-blocker or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

**Caution** systemic absorption follows topical application; history of renal calculi; chronic corneal defects, history of intra-ocular surgery; interactions: Appendix 1 (dorzolamide)

**Contra-indications** hyperchloraemic acidosis

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid—risk—limited information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, bitter taste, dry mouth; headache, asthenia; ocular irritation, blurred vision, lacrimation, conjunctivitis, superficial punctuate keratitis, eye oedema, epistaxis, throat irritation

**Dose**
- Used alone, apply 3 times daily
- With topical beta-blocker, apply twice daily

**Polassium**

**Eye drops** dorzolamide (as hydrochloride) 2%, net price 5 mL = £5.61

**Excipients** may include benzalkonium chloride

**Trusopt** (MSD) (= eye drops), in Ocumeter Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, net price 5 mL = £6.33

**Excipients** include benzalkonium chloride

**Unit dose eye drops** dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 60 × 0.2 mL = £28.59

Miotics

The small pupil is an unfortunate side-effect of these drugs (except when pilocarpine is used temporarily before an operation for angle-closure glaucoma). They act by opening up the inefficient drainage channels in the trabecular meshwork resulting from contraction or spasm of the ciliary muscle.

**Pilocarpine**, a miotic, is used in the management of raised intra-ocular pressure.

**Cautions** A darkly pigmented iris may require higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage. Retinal detachment has occurred in susceptible individuals and those with retinal disease; therefore fundus examination is advised before starting treatment with a miotic. Care is also required in conjunctival or corneal damage. Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic. Miotics should be used with caution in patients with peptic ulceration, gastro-intestinal spasm, cardiac disease, hypertension, hypotension, marked vasomotor instability, asthma, epilepsy, Parkinson’s disease, hyperthyroidism, and urinary-tract obstruction.

**Counselling** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting conditions

**Contra-indications** Miotics are contra-indicated in conditions where pupillary constriction is undesirable such as acute iritis, anterior uveitis and some forms of secondary glaucoma. They should be avoided in acute inflammatory disease of the anterior segment.

**Pregnancy** avoid unless potential benefit outweighs risk—limited information available

**Breast-feeding** avoid unless potential benefit outweighs risk—no information available

**Side-effects** Ciliary spasm leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment (a particular disadvantage in patients under 40 years of age). Ocular side-effects include burning, itching, smarting, blurred vision, conjunctival vascular congestion, myopia, lens changes with chronic use, vitreous haemorrhage, and pupillary block. Systemic side-effects (see under Parasympathomimetics, section 7.4.1) are rare following application to the eye.

PILOCARPINE

**Indications** see notes above; dry mouth (section 12.3.5)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply up to 4 times daily; long-acting preparations, see under preparations below
Pilocarpine Hydrochloride (Non-proprietary)  
**Eye drops**, pilocarpine hydrochloride 1%, net price 10 mL = £3.00; 2%, 10 mL = £2.87; 4%, 10 mL = £3.83  
**Excipients** may include benzalkonium chloride

- **Single use**  
  **Minims® Pilocarpine Nitrate** (Bausch & Lomb)  
  **Eye drops**, pilocarpine nitrate 2%, net price 20 × 0.5 mL = £10.04

- **Long acting**  
  **Pilogel®** (Alcon)  
  **Ophthalmic gel**, pilocarpine hydrochloride 4%, net price 5 g = £6.52  
  **Excipients** include benzalkonium chloride, disodium edetate  
  **Dose** apply 1–1.5 cm gel once daily at bedtime

---

**11.7 Local anaesthetics**

Oxybuprocaine and tetracaine (amethocaine) are widely used topical local anaesthetics. Proxymetacaine causes less initial stinging and is useful for children. Oxybuprocaine or a combined preparation of lidocaine and fluorescein is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine, with or without adrenaline (epinephrine), is injected into the eyelids for minor surgery, while retrobulbar or peribulbar injections are used for surgery of the globe itself. Local anaesthetics should never be used for the management of ocular symptoms. Local anaesthetic eye drops should be avoided in pre-term neonates because of the immaturity of the metabolising enzyme system.

**LIDOCAINE HYDROCHLORIDE**  
**Indications** local anaesthetic  
**Minims® Lidocaine and Fluorescein** (Bausch & Lomb)  
**Eye drops**, lidocaine hydrochloride 4%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £10.61

**OXYBUPROCAINE HYDROCHLORIDE**  
**Indications** local anaesthetic  
**Minims® Oxybuprocaine Hydrochloride** (Bausch & Lomb)  
**Eye drops**, oxybuprocaine hydrochloride 0.4%. Net price 20 × 0.5 mL = £8.92

**PROXYMETACAINA HYDROCHLORIDE**  
**Indications** local anaesthetic  
**Minims® Proxymetacaine** (Bausch & Lomb)  
**Eye drops**, proxymetacaine hydrochloride 0.5%. Net price 20 × 0.5 mL = £9.51

- **With fluorescein**  
  **Minims® Proxymetacaine and Fluorescein** (Bausch & Lomb)  
  **Eye drops**, proxymetacaine hydrochloride 0.5%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £10.59

**TETRACAINE HYDROCHLORIDE**  
**Indications** local anaesthetic  
**Minims® Tetracaine Hydrochloride** (Bausch & Lomb)  
**Eye drops**, tetracaine hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.93

---

**11.8 Miscellaneous ophthalmic preparations**

**11.8.1 Tear deficiency, ocular lubricants, and astringents**

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjogren’s syndrome) often responds to tear replacement therapy or pilocarpine given by mouth (section 12.3.5). The severity of the condition and patient preference will often guide the choice of preparation.

Hypromellose is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as acetylcysteine can be helpful. The ability of carboxomers to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Povidone and sodium hyaluronate eye drops are also used in the management of tear deficiency.

Sodium chloride 0.9% drops are sometimes useful in tear deficiency, and can be used as ‘comfort drops’ by contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intraocular surgery.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application...
before sleep. Ointments should not be used during contact lens wear.

**ACETYL-CYSTEINE**

**Indications**  
Tear deficiency, impaired or abnormal mucus production

**Dose**  
- Apply 3–4 times daily

**lube** (Moorfields)  
Eye drops, acetylcysteine 5%, hypromellose 0.35%.  
Net price 10 mL = £4.40  
Excipients include benzalkonium chloride, disodium edetate

**CARBOMERS**  
(Polyacrylic acid)

**Note**  
Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol

**Indications**  
Dry eyes including keratoconjunctivitis sicca, unstable tear film

**Dose**  
- Apply 3–4 times daily or as required

**Clinitas Gel** (Altacon)  
Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.80  
Excipients include benzalkonium chloride

**Liposic** (Bausch & Lomb)  
Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.96  
Excipients include cetrimide

**Liquivisc** (Spectrum Thea)  
Gel (= eye drops), carbomer 974P (polyacrylic acid) 0.2%, net price 10 g = £2.96  
Excipients include cetrimide

**Lumecare Long Lasting Tear Gel** (Medicom)  
Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.10  
Excipients include cetrimide

**Viscotears** (Novartis)  
Liquid gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.94  
Excipients include cetrimide

**Lumecare Long Lasting Tear Gel** (Medicom)  
Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 30 × 0.6-mL single-dose units = £3.42

**CARMELLOSE SODIUM**

**Indications**  
Dry eye conditions

**Dose**  
- Apply as required

**Optive®** (Allergan)  
Eye drops, carmellose sodium 0.5%, glycerol, net price 10 mL = £7.49

**Single use**

**Celluvisc®** (Allergan)  
Eye drops, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75; 90 × 0.4 mL = £15.53; 1%, 30 × 0.4 mL = £3.00, 60 × 0.4 mL = £10.99

**HYDROXYETHYLCELLULOSE**

**Indications**  
Tear deficiency

**Minims® Artificial Tears** (Bausch & Lomb)  
Eye drops, hydroxyethylcellulose 0.44%, sodium chloride 0.35%. Net price 20 × 0.5 mL = £8.21

**HYDROXYPROPYL GUAR**

**Indications**  
Dry eye conditions

**Dose**  
- Apply as required

**Systane®** (Alcon)  
Eye drops, hydroxypropyl guar, net price 10 mL = £4.66

**Single use**

**Systane®** (Alcon)  
Eye drops, hydroxypropyl guar, net price 28 × 0.8 mL = £4.66

**HYPROMELLOSE**

**Indications**  
Tear deficiency

**Note**  
The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypromellose prescribed, the prescriber should be contacted to clarify the strength intended.

**Hypromellose** (Non-proprietary)  
Eye drops, hypromellose 0.3%, net price 10 mL = £1.61  
Excipients may include benzalkonium chloride  
Brands include Artefac®, Lumecare® Hypermellose

**Isopo Alkaline®** (Alcon)  
Eye drops, hypromellose 1%, net price 10 mL = 94p  
Excipients include benzalkonium chloride

**Isopo Plain®** (Alcon)  
Eye drops, hypromellose 0.5%, net price 10 mL = 81p  
Excipients include benzalkonium chloride

**Tears Naturale®** (Alcon)  
Eye drops, hypromellose 0.3%, dextran ’70’ 0.1%, net price 15 mL = £1.60  
Excipients include benzalkonium chloride, disodium edetate

**Single use**

**Artelac® SDU** (Pharma-Global)  
Eye drops, hypromellose 0.32%, net price 30 × 0.5 mL = £16.95

**Hydromoor®** (Moorfields)  
Eye drops, hypromellose 0.3%, net price 30 × 0.4 mL = £5.75

**Lumecare® Preservative Free Tear Drops** (Medicom)  
Eye drops, hypromellose 0.3%, net price 30 × 0.5 mL = £5.72

**Tears Naturale® Single Dose** (Alcon)  
Eye drops, hypromellose 0.3%, dextran ’70’ 0.1%, net price 28 × 0.4 mL = £13.26

**LIQUID PARAFFIN**

**Indications**  
Dry eye conditions

**Lacril-Lube®** (Allergan)  
Eye ointment, white soft paraffin 57.3%, liquid paraffin 42.5%, wool alcohols 0.2%. Net price 3.5 g = £2.51, 5 g = £3.32
### PARAFFIN, YELLOW, SOFT

**Indications**  
see notes above

**Simple Eye Ointment**  
*Ointment*, liquid paraffin 10%, wool fat 10%, in yellow soft paraffin. Net price 4 g = £3.06

### POLYVINYL ALCOHOL

**Indications**  
tear deficiency

**Liquifilm Tears**  
(Allergan)  
*Ophthalmic solution* (= eye drops), polyvinyl alcohol 1.4%. Net price 15 mL = £1.93  
Excipients include benzalkonium chloride, disodium edetate

**Sno Tears**  
(Bausch & Lomb)  
*Eye drops*, polyvinyl alcohol 1.4%. Net price 10 mL = £1.06  
Excipients include benzalkonium chloride, disodium edetate

### POVIDONE

**Indications**  
dry eye conditions

**Dose**  
• Apply 4 times daily or as required

**Oculotect**  
(Novartis)  
*Eye drops*, povidone 5%. Net price 20 × 0.4 mL = £3.40

### SODIUM CHLORIDE

**Indications**  
irrigation, including first-aid removal of harmful substances

**Sodium Chloride 0.9% Solutions**  
See section 13.11.1

**Balanced Salt Solution**  
*Solution* (sterile), sodium chloride 0.64%, sodium acetate 0.39%, sodium citrate 0.17%, calcium chloride 0.046%, magnesium chloride 0.03%, potassium chloride 0.075%.  
For intra-ocular or topical irrigation during surgical procedures  
Brands include *Iocare*®

**Fluorescein sodium** is used in diagnostic procedures and for locating damaged areas of the cornea due to injury or disease.

**FLUORESCIN SODIUM**

**Indications**  
detection of lesions and foreign bodies

**Minims® Fluorescein Sodium**  
(Bausch & Lomb)  
*Eye drops*, fluorescein sodium 1% or 2%. Net price 20 × 0.5 mL (both) = £7.53  
With local anaesthetic  
Section 11.7

**Ocular diagnostic preparations**

Fluorescein sodium is used in diagnostic procedures and for locating damaged areas of the cornea due to injury or disease.

**Ocular peri-operative drugs**

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

Non-steroidal anti-inflammatory eye drops such as diclofenac, flurbiprofen, ketorolac, and nepafenac, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Diclofenac and flurbiprofen are also used to prevent miosis during ocular surgery.

**Apraclonidine**, an alpha-2-adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intra-ocular pressure prior to surgery.

**Acetylcholine**, instilled into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.
Intra-ocular sodium hyaluronate and balanced salt solution (section 11.8.1) are used during surgical procedures on the eye.

**ACETYLCHOLINE CHLORIDE**

**Indications** cataract surgery, penetrating keratoplasty, iridectomy, and other anterior segment surgery requiring rapid complete miosis

**Cautions** gastrointestinal spasm, peptic ulcer; heart failure; asthma; hyperthyroidism; urinary-tract obstruction; parkinsonism

**Pregnancy** avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** avoid unless potential benefit outweighs risk—no information available

**Side-effects** rarely bradycardia, hypotension, breathing difficulty, sweating, flushing

**Mi chol-E® (Novartis) (SD Healthcare)**

**Intra-ocular irrigation** powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

**Miptel® (SD Healthcare)**

**Intra-ocular irrigation** powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

**APRACLONIDINE**

**Note** Apraclonidine is a derivative of clonidine

**Indications** control of intra-ocular pressure

**Cautions** history of angina, severe coronary insufficiency, recent myocardial infarction, heart failure, cerebrovascular disease, vasovagal attack, chronic renal failure; depression; monitor intra-ocular pressure and visual fields; loss of effect may occur over time; suspend treatment if reduction in vision occurs in end-stage glaucoma; monitor for excessive reduction in intra-ocular pressure following peri-operative use; **interactions:** Appendix 1 (apraclonidine)

**Driving** Drowsiness may affect performance of skilled tasks

**Contra-indications** history of severe or unstable and uncontrolled cardiovascular disease

**Pregnancy** manufacturer advises caution—no information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** dry mouth, taste disturbance; hyperaemia, ocular pruritus, discomfort and lacrimation (withdraw if ocular intolerance including oedema of lids and conjunctiva); headache, asthenia, dry nose; lid retraction, conjunctival blanching and mydriasis reported after peri-operative use; since absorption may follow topical application systemic effects (see Clonidine, section 2.5.2) may occur

**Dose**

- See under preparations below

**Lopidine® (Alcon) (Sun) (SD Healthcare)**

**Ophthalmic solution** (= eye drops), apraclonidine 0.5% (as hydrochloride), net price 5 mL = £10.88

**Excipients** include benzalkonium chloride

**Dose** short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug (see note below), apply 1 drop 3 times daily usually for max. 1 month. **CHILD** not recommended

**Note** May not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

**DICLOFENAC SODIUM**

**Indications** inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties); postoperative inflammation in cataract surgery, strabismus surgery or argon laser trabeculoplasty; pain in corneal epithelial defects after photorefractive keratectomy, radial keratotomy or accidental trauma; seasonal allergic conjunctivitis (section 11.4.2)

**Voltarol® Ophtha Multidose** (Novartis) (Allergan)

**Eye drops**, diclofenac sodium 0.1%, net price 5 mL = £6.68

**Excipients** include benzalkonium chloride, disodium edetate, propylene glycol

**Single use**

**Voltarol® Ophtha** (Novartis) (Allergan)

**Eye drops**, diclofenac sodium 0.1%, net price pack of 5 single-dose units = £4.00, 40 single-dose units = £32.00

**FLURBIPROFEN SODIUM**

**Indications** inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties); anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

**Ocufen® (Allergan)** (Allergan)

**Ophthalmic solution** (= eye drops), flurbiprofen sodium 0.03%, polyvinyl alcohol (Liquifilm®) 1.4%, net price 40 x 0.4 mL = £37.15

**KETOROLAC TROMETAMOL**

**Indications** prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

**Acular® (Allergan)** (Allergan)

**Eye drops**, ketorolac trometamol 0.5%, net price 5 mL = £3.00

**Excipients** include benzalkonium chloride, disodium edetate

**NEPAFENAC**

**Indications** prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery

**Cautions** avoid sunlight; discontinue immediately if evidence of corneal epithelial breakdown

**Side-effects** headache; punctuate keratitis, blurred vision, eye pruritus, dry eye, less commonly nausea, dry mouth; iritis; keratitis, corneal deposits, choroidal effusion, allergic conjunctivitis, increased lacrimation, photophobia, conjunctival hyperaemia

**Nevanac® (Alcon) (Sun) (SD Healthcare)**

**Ophthalmic suspension** (= eye drops), nepafenac 1 mg/mL, net price 5 mL = £14.92

**Excipients** include benzalkonium chloride, disodium edetate
Subfoveal choroidal neovascularisation

Pegaptanib and ranibizumab are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration; they are given by intravitreal injection by specialists experienced in the management of this condition.

NICE guidance
Ranibizumab and pegaptanib for the treatment of wet age-related macular degeneration (August 2008)

Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:

- the best corrected visual acuity is between 6/12 and 6/96;
- there is no permanent structural damage to the central fovea;
- the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
- there is evidence of recent disease progression;

the cost of ranibizumab beyond 14 injections is met by the manufacturer.

Ranibizumab should only be continued in patients who maintain adequate response to therapy. Pegaptanib is not recommended for the treatment of wet age-related macular degeneration; patients currently receiving pegaptanib for any lesion type can continue therapy until they and their specialist consider it appropriate to stop.

Verteporfin is licensed for use in the photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (see NICE guidance below). Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives. Only specialists experienced in the management of these conditions should use it.

NICE guidance
Photodynamic therapy for wet age-related macular degeneration (September 2003)

Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better. Photodynamic therapy is not recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation except in clinical studies.

Side-effects

Rhinorhoea; headache; eye pain, anterior chamber inflammation, raised intra-ocular pressure, punctate keratits, vitreous floats, cataract, conjunctival and retinal haemorrhage, local oedema, conjunctivitis, corneal dystrophy, dry eye, endophthalmitis, eye discharge, eye irritation, macular degeneration, mydriasis, periorbital haematoma, photophobia, flashing lights, vitreous disorders; less commonly vomiting, dyspepsia, palpitation, chest pain, hypertension, aortic aneurysm, influenza-like symptoms, nightmares, depression, back pain, asthenopia, blepharitis, corneal deposits, vitreous haemorrhage, chaliazon, retinal exudates, eyelid ptosis, decreased intra-ocular pressure, injection-site reactions, retinal detachment, occlusion of retinal blood vessels, ectropion, eye movement disorder, pupillary disorder, iritis, optic nerve cupping, nasopharyngitis, deafness, vertigo, eczema, changes in hair colour, rash, pruritus, night sweats

Dose

- By intravitreal injection, 300 micrograms once every 6 weeks into the affected eye

Note: For further information on administration, consult product literature. Review treatment if no benefit after 2 consecutive injections

Macugen® (Pfizer) ©
Solution for intravitreal injection, pegaptanib (as sodium salt), net price 300-microgram vial = £514.00

RANIBIZUMAB

Indications

see notes above—specialist use only

Cautions

monitor intra-ocular pressure and for signs of ocular infection following injection

Contra-indications

ocular or periorcular infection;
severe intra-ocular inflammation

Pregnancy

manufacturer advises avoid unless potential benefit outweighs risk and recommends effective contraception during treatment

Breast-feeding

manufacturer advises avoid—no information available

Side-effects

nausea; headache; nasopharyngitis, cough; anxiety; anaemia; arthralgia; raised intra-ocular pressure, visual disturbance, conjunctival retinal and vitreous disorders, eye inflammation and irritation, eye haemorrhage; allergic skin reactions; less commonly atrial fibrillation, blindness, corneal disorders, iris adhesion, injection site reactions

Dose

- By intravitreal injection, initially 500 micrograms once a month into the affected eye, thereafter monitor visual acuity once a month; if necessary subsequent doses may be given at least 1 month apart

Note: For further information on administration, consult product literature

Antimicrobial eye drops should be administered into the affected eye for 3 days before and 3 days after each injection

Lucentis® (Novartis) © (BNF)
Solution for intravitreal injection, ranibizumab 10 mg/mL, net price 0.23-mL vial = £761.20

PEGAPTANIB SODIUM

Indications

see notes above—specialist use only

Cautions

monitor intra-ocular pressure following injection

Contra-indications

ocular or periorcular infection

Pregnancy

manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding

manufacturer advises avoid—no information available

VERTEPORFIN

Indications

see notes above—specialist use only

Cautions

photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards; concomitant use with other
photosensitising drugs; biliary obstruction; avoid extravasation

**Contra-indications**  
- acute porphyria
- Hepatic impairment use with caution in moderate impairment; avoid in severe impairment
- Pregnancy manufacturer advises use only if potential benefit outweighs risk (teratogenic in animal studies)

**Breast-feeding**  
- no information available—manufacturer advises avoid breast-feeding for 48 hours after administration

**Side-effects**  
- nausea, hypercholesterolaemia, malaise, back pain, photosensitivity, visual disturbances (including reduced visual acuity, flashing lights, visual-field defects), less commonly hypertension, hyperaesthesia, pyrexia, retinal detachment, haemorrhage, rarely retinal or choroidal vessel non-perfusion; also reported chest pain, myocardial infarction

**Dose**  
- By intravenous infusion over 10 minutes, 6 mg/m²

**Note**  
- For information on administration and light activation, consult product literature

**Visudyne** (Novartis)®

Injection, powder for reconstitution, verteporfin, net price 15-mg vial = £850.00

**Excipients** include butylated hydroxytoluene

---

**11.9 Contact lenses**

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. Continuous (extended) wear involves much greater risks to eye health and is not generally recommended except where medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

*Acanthamoeba keratitis*, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

**Contact lenses and drug treatment**  
- Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic reactions. Therefore, unless medically indicated, the lenses should be removed before drop instillation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine and hydralazine). Other drugs that may affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (saliicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolor lenses).

- oropharyngeal infections, p. 695
- periodontitis, p. 693

12.1 Drugs acting on the ear

12.1.1 Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin or clioquinol) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid (such as Locorten-Vioform) are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity in patients with a perforated tympanic membrane (eardrum), manufacturers contra-indicate treatment with a topical aminoglycoside antibiotic in those with a tympanic perforation. However, many specialists do use these drops cautiously in the presence of a perforation in patients with otitis media (section 12.1.2) and when other measures have failed for otitis externa.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EarCalm spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol (section 4.7.1) or ibu-
prophen (section 10.1.1), can be used. A systemic antibacterial (Table 1, section 5.1) can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, fluocortolone is the drug of choice; ciprofloxacin (or an aminoglycoside) may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments (section 13.4) are then required, but prolonged use should be avoided.

### Astringent preparations

**ALUMINIUM ACETATE**

**Indications** inflammation in otitis externa (see notes above)

**Dose**
- Insert into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

**Aluminium Acetate (Non-proprietary)**
- **Ear drops** 13%, aluminium sulphate 2.25 g, calcium carbonate 1 g, tartaric acid 450 mg, acetic acid (33%) 2.5 mL, purified water 7.5 mL
- Available from manufacturers of ‘special order’ products
- **Ear drops** 8%, dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared

### Anti-inflammatory preparations

#### Corticosteroids

Topical corticosteroids are used to treat inflammation and eczema in otitis externa. **Cautions** Prolonged use of topical corticosteroid ear preparations should be avoided.

**Contra-indications** Corticosteroid ear preparations should be avoided in the presence of an untreated ear infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-inflammatory (see notes above).

**Side-effects** Local sensitivity reactions may occur.

#### BETAMETHASONE SODIUM PHOSPHATE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Betnesol®** (UCB Pharma)
- **Ear drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.23
- **Excipients** include benzalkonium chloride, disodium edetate
- **Dose** ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained; eye, section 11.4.1; nose, section 12.2.1

### With antibacterial

**Betnesol-N®** (UCB Pharma)
- **Ear drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 10 mL = £2.30
- **Excipients** include benzalkonium chloride, disodium edetate
- **Dose** ear, apply 2–3 drops every 3–4 hours; reduce frequency when relief obtained; eye, section 11.4.1; nose, section 12.2.1

### DEXAMETHASONE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### With antibacterial

**Otimize®** (GSK Consumer Healthcare)
- **Ear spray**, dexamethasone 0.1%, neomycin sulphate 3250 units/mL, glacial acetic acid 2%. Net price 5-mL pump-action aerosol unit = £3.71
- **Excipients** include hydroxybenzoates (parabens)
- **Dose** ear, apply 1 metered spray 3 times daily

**Sofradex®** (Sanofi-Aventis)
- **Ear drops** (for ear or eye), dexamethasone (as sodium metabsulphobenzozate) 0.05%, framycetin sulphate 0.5%, gramicidin 0.005%. Net price 10 mL = £6.25
- **Excipients** include polysorbate 80
- **Dose** ear, apply 2–3 drops 3–4 times daily; eye, section 11.4.1

### FLUMETASONE PIVALATE

(Flumethasone Pivalate)

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### With antibacterial

**Locorten-Vioform®** (Amdipharm)
- **Ear drops**, flumetasone pivalate 0.02%, clioquinol 1%. Net price 7.5 mL = £1.76
- **Contra-indications** iodine sensitivity
- **Dose** ADULT and CHILD over 2 years apply 2–3 drops into the ear twice daily for 7–10 days
- **Note** Clioquinol stains skin and clothing

### HYDROCORTISONE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above
With antibacterial

Gentisone® HC (Amdipharm) 

Ear drops, hydrocortisone acetate 1%, gentamicin 0.3% (as sulphate). Net price 10 mL = £3.92

Excipients include benzalkonium chloride, disodium edetate

Dose: ear, apply 2–4 drops 3–4 times daily and at night

Otosporin® (GSK)

Ear drops, hydrocortisone 1%, neomycin sulphate 3400 units, polymyxin B sulphate 10 000 units/mL. Net price 5 mL = £2.00; 10 mL = £4.00

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), polysorbate 20

Dose: ADULT and CHILD over 3 years, ear, apply 3 drops 3–4 times daily

Predsol® (UCB Pharma)

Drops (for ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £1.92

Excipients include benzenzium chloride, disodium edetate

Dose: ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained; eye, section 11.4.1

Predsol-N® (UCB Pharma)

Drops (for ear or eye), prednisolone sodium phosphate 0.5%, neomycin sulphate 0.5%. Net price 10 mL = £2.27

Excipients include benzalkonium chloride, disodium edetate

Dose: ear, apply 2–3 drops 3–4 times daily; eye, section 11.4.1

Anti-infective preparations

CHLORAMPHENICOL

Indications: bacterial infection in otitis externa (but see notes above)

Cautions: avoid prolonged use (see notes above)

Side-effects: high incidence of sensitivity reactions to vehicle

Chloramphenicol (Non-proprietary) 

Ear drops, chloramphenicol in propylene glycol, net price 5%, 10 mL = £6.22; 10%, 10 mL = £5.62

Dose: ear, apply 2–3 drops 2–3 times daily

CLOQUINOL

Indications: mild bacterial or fungal infections in otitis externa (see notes above)

Cautions: avoid prolonged use (see notes above); manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

Side-effects: local sensitivity, stains skin and clothing

With corticosteroid

Locoten-Vioform® see Flumetasone, p. 686

CLOTRIMAZOLE

Indications: fungal infection in otitis externa (see notes above)

Side-effects: occasional local irritation or sensitivity

Canesten® (Bayer Consumer Care)

Solution, clotrimazole 1% in polyethylene glycol 400 (macrogol 400). Net price 20 mL = £2.43

Dose: ear, apply 2–3 times daily continuing for at least 14 days after disappearance of infection; skin, section 13.10.2

FRAMYCETIN SULPHATE

Indications: bacterial infection in otitis externa (see notes above)

Cautions: avoid prolonged use (see notes above)

Contra-indications: perforated tympanic membrane (see p. 685)

Side-effects: local sensitivity

GENTAMICIN

Indications: bacterial infection in otitis externa (see notes above)

Cautions: avoid prolonged use (see notes above)

Contra-indications: perforated tympanic membrane (see also p. 685 and section 12.1.2)

Side-effects: local sensitivity

Gentisone® HC see Hydrocortisone, above

GENTAMICIN

Indications: bacterial infection in otitis externa (see notes above)

Cautions: avoid prolonged use (see notes above)

Contra-indications: perforated tympanic membrane

Side-effects: local sensitivity

Gentisone® HC see Hydrocortisone, above

Betnesol-N® see Dexamethasone, p. 686

Otozint® see Dexamethasone, p. 686

Predsol-N® see Prednisolone, above

12.1.2 Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza,
are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a simple analgesic, such as paracetamol, may be sufficient. In children without systemic features, a systemic antibacterial (Table 1, section 5.1) may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with acute otitis media usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial (Table 1, section 5.1) can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.

Otitis media with effusion Otitis media with effusion (‘glue ear’) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If ‘glue ear’ persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

Chronic otitis media Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Wax can be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium or urea–hydrogen peroxide are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to co-operate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

**Removal of ear wax** Wax is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

**Chronic otitis media** Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin (or erythromycin if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing. Parenteral antibacterials are required if **Pseudomonas aeruginosa** and **Proteus** sp. are present. Manufacturers contra-indicate topical treatment with ototoxic antibacterials in the presence of a perforation (section 12.1.1). However, many specialists use ear drops containing aminoglycosides (e.g. neomycin) or polynyxins if the otitis media has failed to settle with systemic antibacterials; it is considered that the pus in the middle ear associated with otitis media carries a higher risk of ototoxicity than the drops themselves. Ciprofloxacin or ofloxacin ear drops (both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies, see p. 968) or eye drops used in the ear (unlicensed indication) are an effective alternative to aminoglycoside ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

**Removal of ear wax** Wax is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Wax can be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium or urea–hydrogen peroxide are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to co-operate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

**Removal of ear wax** Wax is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.
Nasal polyps  Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the ‘head down’ position. A short course of a systemic corticosteroid (section 6.3.2) may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

12.2.1 Drugs used in nasal allergy

Mild allergic rhinitis is controlled by antihistamines (see also section 3.4.1) or topical nasal corticosteroids; systemic nasal decongestants are of doubtful value (section 3.10). Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid. More persistent symptoms and nasal congestion can be relieved by topical nasal corticosteroids; cromoglicate (cromoglycate) is an alternative, but may be less effective. The topical antihistamine azelastine is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis. Montelukast (section 3.3.2) is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vaso- motor rhinitis. In this situation, the addition of topical nasal ipratropium bromide (section 6.2.2) can reduce watery rhinorrhea. Very disabling symptoms occasionally justify the use of systemic corticosteroids for short periods (section 6.3), for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

Pregnancy  If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone, budesonide, fluticasone, or sodium cromoglicate may be considered.

Antihistamines

AZELASTINE HYDROCHLORIDE

Indications  allergic rhinitis

Side-effects  irritation of nasal mucosa; bitter taste (if applied incorrectly)

Corticosteroids

Nasal preparations containing corticosteroids (beclometasone, budesonide, flunisolide, fluticasone, mometasone, and triamcinolone) have a useful role in the prophylaxis and treatment of allergic rhinitis (see notes above).

Cautions  Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, and also after nasal surgery (until healing has occurred); they should also be avoided in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids, see section 6.3.2. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Side-effects  Local side-effects include dryness, irritation of nose and throat, and epistaxis. Nasal ulceration has been reported, but occurs commonly with nasal preparations containing fluticasone furoate or mometasone furoate. Nasal septal perforation (usually following nasal surgery) occurs very rarely. Raised intra-ocular pressure or glaucoma may occur rarely. Headache, smell and taste disturbances may also occur. Hypersensitivity reactions, including bronchospasm, have been reported.

BECLOMETASONE DIPROPIONATE
(Beclomethasone Dipropionate)

Indications  prophylaxis and treatment of allergic and vaso-motor rhinitis

Cautions  see notes above

Side-effects  see notes above

Dose  • ADULT and CHILD over 6 years, 100 micrograms (2 sprays) into each nostril twice daily; max. total 400 micrograms (8 sprays) daily; when symptoms controlled, dose reduced to 50 micrograms (1 spray) into each nostril twice daily
12.2.1 Drugs used in nasal allergy

**BETAMETHASONE SODIUM PHOSPHATE**

**Indications** non-infected inflammatory conditions of nose

**Cautions** see notes above

**Side-effects** see notes above

**Betnesol** (UCB Pharma) 

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.23

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** nose, 2–3 drops into each nostril 2–3 times daily; ear, section 12.1.1; eye, section 11.4.1

**Vistamethasone** (Martindale)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02, 10 mL = £1.16

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** nose, 2–3 drops into each nostril twice daily; ear, section 12.1.1; eye, section 11.4.1

**BUDESONIDE**

**Indications** prophylaxis and treatment of allergic rhinitis and perennial rhinitis; nasal polyps

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Side-effects** see notes above

**Dose**

1. See preparations

2. Beudesone (Non-proprietary)

**Nasal spray**, budesonide 100 micrograms/metered spray, net price 100-spray unit = £5.90

**Dose** rhinitis, ADULT and CHILD over 12 years, 200 micrograms (2 sprays) into each nostril once daily in the morning or 100 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 100 micrograms (1 spray) into each nostril once daily

Nasal polyps, ADULT and CHILD over 12 years, 64 micrograms (1 spray) into each nostril twice daily for up to 3 months

1. Can be sold to the public for nasal administration (other than by aerosol) if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg

**Rhinocort Aqua** (AstraZeneca)

**Nasal spray**, budesonide 64 micrograms/metered spray, net price 120-spray unit = £2.49

**Excipients** include disodium edetate, polysorbate 80, potassium sorbate

**Dose** rhinitis, ADULT and CHILD over 12 years, 128 micrograms (2 sprays) into each nostril once daily in the morning or 64 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 64 micrograms (1 spray) into each nostril once daily, max. duration of treatment 3 months

Nasal polyps, ADULT and CHILD over 12 years, 64 micrograms (1 spray) into each nostril twice daily for up to 3 months

---

**FLUNISOLIDE**

**Indications** prophylaxis and treatment of allergic rhinitis

**Cautions** see notes above

**Side-effects** see notes above

**Syntaris** (IVAX)

**Aqueous nasal spray**, flunisolide 25 micrograms/metered spray. Net price 240-spray unit with pump and applicator = £5.05

**Excipients** include benzalkonium chloride, butylated hydroxytoluene, disodium edetate, polysorbate 80, propylene glycol

**Dose** ADULT, 50 micrograms (2 sprays) into each nostril twice daily, increased if necessary to max. 3 times daily then reduced for maintenance; CHILD 5–14 years initially 25 micrograms (1 spray) into each nostril up to 3 times daily

**FLUTICASONE PROPIONATE**

**Indications** prophylaxis and treatment of allergic rhinitis and perennial rhinitis; nasal polyps

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Side-effects** see notes above

**Dose**

1. Rhinitis, 100 micrograms (2 sprays) into each nostril once daily, preferably in the morning, increased to max. twice daily if required; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; CHILD 4–11 years, 50 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased to max. twice daily if required

2. Nasal polyps, see Flixonase Nasule® below

**Flixonase** (A&H)

**Aqueous nasal spray**, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit with applicator = £11.01

**Excipients** include benzalkonium chloride, polysorbate 80

**Note** Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg

**Flixonase Nasule** (A&H)

**Nasal drops**, fluticasone propionate 400 micrograms/unit dose, net price 28 × 0.4-mL units = £12.99

**Excipients** include polysorbate 20

**Dose** nasal polyps, ADULT and ADOLESCENT over 16 years, 200 micrograms (approx. 6 drops) into each nostril once or twice daily; consider alternative treatment if no improvement after 4–6 weeks

**Nasofan** (IVAX)

**Aqueous nasal spray**, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit = £8.41

**Excipients** include benzalkonium chloride, polysorbate 80
Fluticasone furoate

Avamys® (GSK) *(G2)*

**Nasal spray**, fluticasone furoate 27.5 micrograms/metered spray, net price 120-spray unit = £6.44.

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80.

**Dose** prophylaxis and treatment of allergic rhinitis, ADULT and CHILD over 12 years, 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to minimum effective dose, 27.5 micrograms (1 spray) into each nostril once daily may be sufficient; CHILD 6–12 years, 27.5 micrograms (1 spray) into each nostril once daily, increased if necessary up to 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to 27.5 micrograms (1 spray) into each nostril once daily.

Side-effects see notes above.

Cautions prophylaxis and treatment of allergic rhinitis.

Indications see preparations.

Nasonex® (Scherer-Plough) *(G2)*

**Nasal spray**, mometasone furoate 50 micrograms/metered spray. Net price 140-spray unit = £7.68.

**Excipients** include benzalkonium chloride, polysorbate 80.

**Dose** prophylaxis and treatment of allergic rhinitis, ADULT and CHILD over 12 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary up to 250 micrograms (4 sprays) into each nostril once daily; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; CHILD 6–11 years, 50 micrograms (1 spray) into each nostril once daily.

**Nasal polyps**, ADULT over 18 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary after 5–6 weeks to 200 micrograms (2 sprays) into each nostril twice daily (consider alternative treatment if no improvement after further 5–6 weeks); reduce to the lowest effective dose when control achieved.

**Side-effects** see notes above.

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80.

**Dose** ADULT and CHILD over 12 years, 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily; CHILD 6–12 years, 55 micrograms (1 spray) into each nostril once daily, increased if necessary to 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months; CHILD 2–6 years see BNF for Children.

Note Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-pressurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis.

Sodium cromoglicate

**Indications** prophylaxis of allergic rhinitis.

**Side-effects** local irritation; rarely transient bronchospasm.

Sodium cromoglicate

**Indications** prophylaxis of allergic rhinitis.

**Side-effects** local irritation; prophylaxis of allergic rhinitis.

12.2.2 Topical nasal decongestants

Rynacrom® (Sanofi-Aventis)

4% aqueous nasal spray, sodium cromoglicate 4% (5.2 mg/spray). Net price 22 mL (150-spray unit with pump) = £17.07.

**Excipients** include benzalkonium chloride, disodium edetate.

**Dose** ADULT and CHILD, 1 spray into each nostril 2–4 times daily.

Vividrin® (Pharma-Global)

**Nasal spray**, sodium cromoglicate 2%. Net price 15 mL (approx. 110-spray unit) = £11.60.

**Excipients** include benzalkonium chloride, edetic acid, polysorbate 80.

**Dose** ADULT and CHILD, 1 spray into each nostril 4–6 times daily.

12.2.2 Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of warm moist air is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (section 3.6).

Symptoms of nasal congestion associated with vaso-motor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine nasal drops is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline are more likely to cause a rebound effect. Symptomatemics may cause a hypertensive crisis if used during treatment with a monoamine-oxidase inhibitor including moclobemide.

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine, oxymetazoline, or xylometazoline can be considered for up to 5 days in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age (section 3.9.1). Non-allergic watery rhinorrhea often responds well to treatment with the antimuscarinic ipratropium bromide.

Systemic nasal decongestants—see section 3.10.

Sinusitis and oral pain Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where
this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air (section 3.8) or with epinephrine nasal drops (see above). For antibacterial treatment of sinusitis, see Table 1, section 5.1.

### Sympathomimetics

#### Ephedrine Hydrochloride

**Indications** nasal congestion  
**Cautions** see section 3.1.1.2 and notes above; also avoid excessive or prolonged use; interactions: Appendix 1 (sympathomimetics)  
**Pregnancy** see section 3.1.1.2  
**Breast-feeding** see section 3.1.1.2  
**Side-effects** local irritation, nausea, headache; after excessive use tolerance with diminished effect, rebound congestion; cardiovascular effects also reported  
**Dose**  
- See below

**Ephedrine** (Non-proprietary)  
**Nasal drops**, ephedrine hydrochloride 0.5%, net price 10 mL = £1.39; 1%, 10 mL = £1.63  
**Note** The BF directs that if no strength is specified 0.5% drops should be supplied  
**Dose**  
- **ADULT** and **CHILD** over 12 years, 1–2 drops into each nostril up to 3 or 4 times daily when required, max. duration 7 days; **CHILD** under 12 years see **BNF for Children**  
**Dental prescribing on NHS** Ephedrine nasal drops may be prescribed  
1. Can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see **Medicines, Ethics and Practice**, No. 34, London, Pharmaceutical Press, 2010 (and subsequent editions)

#### Xylocaine Hydrochloride

**Indications** nasal congestion  
**Cautions** see under Ephedrine Hydrochloride section 3.1.1.2 and notes above; also avoid excessive or prolonged use  
**Pregnancy** manufacturer advises avoid  
**Side-effects** see under Ephedrine Hydrochloride and notes above; in small children, also restlessness, sleep disturbances, and hallucinations (discontinue treatment)  
**Dose**  
- See below

**Xylocaine** (Non-proprietary)  
**Nasal drops**, xylocaine hydrochloride 0.1%, net price 10 mL = £1.91  
**Dose** 2–3 drops into each nostril 2–3 times daily when required; max. duration 7 days; not recommended for children under 12 years  
**Brands include** Otrivine®.  
**Paediatric nasal drops**, xylocaine hydrochloride 0.05%, net price 10 mL = £1.59  
**Dose**  
- **CHILD** 6–12 years 1–2 drops into each nostril 1–2 times daily when required; max. duration 5 days  
**Brands include** Otrivine®, Rinatec®

### Antimuscarinic

#### Ipratropium Bromide

**Indications** rhinorrhea associated with allergic and non-allergic rhinitis  
**Cautions** see section 3.1.2; avoid spraying near eyes  
**Side-effects** epistaxis, nasal dryness, and irritation; less frequently nausea, headache, and pharyngitis; very rarely antimuscarinic effects such as gastrointestinal motility disturbances, palpitations, and urinary retention  
**Dose**  
- **ADULT** and **CHILD** over 12 years, 42 micrograms (2 sprays) into each nostril 2–3 times daily  
**Rinatec®** (Boehringer Ingelheim)  
**Nasal spray 0.03%**, ipratropium bromide 21 micrograms/metered spray. Net price 180-dose unit = £3.99  
**Excipients** include benzalkonium chloride, disodium edetate

### 12.2.3 Nasal preparations for infection

There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; for elimination of nasal staphylococci, see below.

Systemic treatment of sinusitis—see Table 1 section 5.1.

#### Betnesol-N®

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 10 mL = £2.30  
**Excipients** include benzalkonium chloride, disodium edetate  
**Dose**  
- **nose** 2–3 drops into each nostril 2–3 times daily; eye, section 11.4.1; ear, section 12.1.1

### Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Naseptin®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population. A nasal ointment containing mupirocin is also available; it should probably be held in reserve for resistant cases. In hospital or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant Staphylococcus aureus (MRSA). The ointment should be applied 3 times daily for 5 days and a sample taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more
than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

Bactroban Nasal® (GSK) Nasal ointment, mupirocin 2% (as calcium salt) in white soft paraffin basis. Net price 3 g = £5.80

Dose for eradication of nasal carriage of *Staphylococcus* including meticillin-resistant *Staphylococcus aureus* (MRSA), apply 2–3 times daily to the inner surface of each nostril

Naseptin® (Alliance) Cream, chlorhexidine hydrochloride 0.1%, neomycin sulphate 0.5%, net price 15 g = £1.90

Excipients include arachis (peanut) oil, cetostearyl alcohol

Dose for eradication of nasal carriage of *Staphylococcus* (including MRSA), apply to nostrils twice daily for 10 days; for preventing nasal carriage of *Staphylococcus* (including MRSA), apply to nostrils twice daily

**12.3 Drugs acting on the oropharynx**

**12.3.1 Drugs for oral ulceration and inflammation**

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy-induced mucositis and myelosuppression, section 8.1). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer.

**Simple mouthwashes** A saline mouthwash (section 12.3.4) may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subside.

**Antiseptic mouthwashes** Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of chlorhexidine mouthwash (section 12.3.4) is often beneficial and may accelerate healing of recurrent aphthae.

**Mechanical protection** Carmellose gelatin paste may relieve some discomfort arising from ulceration by protecting the ulcer site. As the paste adheres to dry mucosa, it is difficult to apply it effectively to the tongue and oropharynx.

**Corticosteroids** Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase.

**Local analgesics** Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine 5% ointment or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine 10% solution as spray (section 15.2) can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

**Flurbiprofen** lozenges are licensed for the relief of sore throat.

**Choline salicylate** dental gel has some analgesic action and may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

**Other preparations** Doxycycline rinsed in the mouth may be of value for recurrent aphthous ulceration.

**Periodontitis** Low-dose doxycycline (Periostar®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis. For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see section 12.3.2 and Table 1, section 5.1. For mouthwashes used for oral hygiene and plaque inhibition, see section 12.3.4.
12 Ear, nose, and oropharynx

**BENZYMADINE HYDROCHLORIDE**

**Indications** painful inflammatory conditions of oropharynx

**Side-effects** occasional numbness or stinging; rarely hypersensitivity reactions

**Difflam** (3M)

**Oral rinse**, green, benzymadine hydrochloride 0.15%, net price 200 mL (Difflam® Sore Throat Rinse) = £2.50; 300 mL = £4.01

**Dose**
- **ADULT** and **adolescent** over 12 years, rinse or gargle using 15 mL (dilute with an equal volume of water if stinging occurs) every 1½–3 hours as required, usually for not more than 7 days.
- **Dental prescribing on NHS** May be prescribed as Benzymadine Mouthwash 0.15%

**Spray**, benzymadine hydrochloride 0.15%. Net price 30-mL unit = £3.17

**Dose**
- **ADULT** 4–8 sprays onto affected area every 1½–3 hours.
- **CHILD** under 6 years 1 spray per 4 kg body-weight to max. 4 sprays every 1½–3 hours.
- **Dental prescribing on NHS** May be prescribed as Benzymadine Oromucosal Spray 0.15%

**CARMELLOSE SODIUM**

**Indications** mechanical protection of oral and perioral lesions

**Orabase** (Convatec)

**Protective paste** (= oral paste), carmellose sodium 16.7%, pectin 16.7%, gelatin 16.7%, in Plastibase®.

Net price 30 g = £2.02; 100 g = £4.48

**Dose** apply a thin layer when necessary after meals

**Dental prescribing on NHS** May be prescribed as Carmellose Gelatin Paste

**Orabase** (Convatec)

**Powder**, carmellose sodium, pectin, gelatin, equal parts. Net price 25 g = £2.28

**Dose** sprinkle on the affected area

**CORTICOSTEROIDS**

**Indications** oral and perioral lesions

**Contra-indications** untreated oral infection; thrush or other candidal infections

**Side-effects** occasional exacerbation of local infection; thrush or other candidal infections

**Hydrocortisone** (Non-proprietary)

**Micromechanical buccal tablets** (= oromucosal tablets), hydrocortisone 2.5 mg (as sodium succinate).

Net price 20 = £2.03

**Dose**
- **ADULT** and **CHILD** over 12 years, 1 lozenge 4 times daily, allowed to dissolve slowly in the mouth in contact with the ulcer; **CHILD** under 12 years, only on medical advice.
- **Dental prescribing on NHS** May be prescribed as Hydrocortisone Oromucosal Tablets

**Betnesol** (UCB Pharma)

**Soluble tablets**, pink, scored, betamethasone 500 micrograms (as sodium phosphate), net price 100-tab pack = £4.97. Label: 10, steroid card, 13, 21

**Dose** oral ulceration, **[unlicensed indication]** ADULT and **CHILD** over 12 years, 500 micrograms dissolved in 20 mL water and rinsed around the mouth 4 times daily; not to be swallowed

**Dental prescribing on the NHS** May be prescribed as Betamethasone Soluble Tablets 500 micrograms

**DOXYCYCLINE**

**Indications** see preparations; oral herpes (section 12.2.2); other indications (section 5.1.3)

**Cautions** section 5.1.3; monitor for superficial fungal infection, particularly if predisposition to oral candidiasis

**Contra-indications** section 5.1.3

**Hepatic impairment** section 5.1.3

**Renal impairment** section 5.1.3

**Pregnancy** section 5.1.3

**Breast-feeding** section 5.1.3

**Side-effects** section 5.1.3; fungal superinfection

**Dose**
- See preparations

**Note** Doxycycline stains teeth; avoid in children under 12 years of age

**Periostat** (Alliance)

**Tablets**, f/c, doxycycline (as hyclate) 20 mg, net price 56-tab pack = £16.50. Label: 6, 11, 27, counselling, posture

**Dose** periodontitis (as an adjunct to gingival scaling and root planing), 20 mg twice daily for 3 months; **CHILD** under 12 years not recommended

**Counselling Tablets** should be swallowed whole with plenty of fluid (at least 100 mL), while sitting or standing

**Dental prescribing on NHS** May be prescribed as Doxycycline Tablets 20 mg

**LOCAL application**

For recurrent aphthous ulceration, a 100 mg doxycycline dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes 4 times daily usually for 3 days; it should preferably not be swallowed **[unlicensed indication]**.

**FLURBIPROFEN**

**Indications** relief of sore throat

**Cautions** section 10.1.1

**Contra-indications** section 10.1.1

**Hepatic impairment** section 10.1.1

**Renal impairment** section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** section 10.1.1

**Side-effects** taste disturbance, mouth ulcers (move lozenge around mouth); see also section 10.1.1

**Strelen** (Reckitt Benckiser)

**Lozenges**, flurbiprofen 8.75 mg, net price 16 = £2.24

**Dose**
- **ADULT** and **CHILD** over 12 years, allow 1 lozenge to dissolve slowly in the mouth every 3–6 hours, max. 5 lozenges in 24 hours, for max. 3 days

**LOCAL ANAESTHETICS**

**Indications** relief of pain in oral lesions

**Cautions** avoid prolonged use; hypersensitivity; avoid anaesthesia of the pharynx before meals—risk of choking

**Hepatic impairment** see Lidocaine section 15.2

**Renal impairment** see Lidocaine section 15.2

**Pregnancy** see Lidocaine section 15.2

**Breast-feeding** see Lidocaine section 15.2

**Lidocaine** (Non-proprietary)

**Ointment**, lidocaine 5% in a water-miscible basis, net price 15 g = 80p

**Dose** rub sparingly and gently on affected areas

**Dental prescribing on NHS** Lidocaine 5% Ointment may be prescribed
Xylocaine® (Astra Zeneca)
Spray (pump spray): lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/spray; 500 spray doses per container. Net price 50-mL bottle = £3.13
Dose apply thinly to the ulcer (unlicensed indication) using a cotton bud
Dental prescribing on NHS May be prescribed as Lidocaine Spray 10%

Preparations on sale to the public
Many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer.

Note The correct proprietary name should be ascertained—many products have very similar names but different active ingredients

SALICYLATES
Indications mild oral and perioral lesions
Cautions not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures; frequent application, especially in children, may give rise to salicylate poisoning
Contra-indications children under 16 years
Reye's syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionsary measure due to the theoretical risk of Reye's syndrome

Choline salicylate
Choline Salicylate Dental Gel, BP
Oral gel, choline salicylate 8.7% in a flavoured gel basis, net price 15 g = £1.89
Brands include Bozole® (sugar-free)
Dose ADULT and CHILD over 16 years, apply ½-inch of gel with gentle massage not more often than every 3 hours
Dental prescribing on NHS Choline Salicylate Dental Gel may be prescribed

Salicylic acid
Pyralvex® (Norgine)
Oral paint, brown, rhubarb extract (anthraquinone glycosides 0.5%), salicylic acid 1%. Net price 10 mL with brush = £3.25
Dose ADULT and CHILD over 16 years, apply 3–4 times daily

Oropharyngeal anti-infective drugs

The most common cause of a sore throat is a viral infection which does not benefit from anti-infective treatment. Streptococcal sore throats require systemic penicillin therapy (Table 1, section 5.1). Acute ulcerative gingivitis (Vincent's infection) responds to systemic metronidazole (section 5.1.11).
Preparations administered in the dental surgery for the local treatment of periodontal disease include gels of metronidazole (Elyzol® Colgate-Palmolive) and of minocycline (Dentomycin®, Blackwell).

Oropharyngeal fungal infections

Fungal infections of the mouth are usually caused by Candida spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

Thrush Acute pseudomembranous candidiasis (thrust), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin or miconazole may be needed. Fluconazole (section 5.2.1) is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred (section 5.2.1).

Acute erythematous candidiasis Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole (section 5.2.1).

Denture stomatitis Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

Miconazole oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the denture base material, may be the cause.

Chronic hyperplastic candidiasis Chronic hyperplastic candidiasis (candidal leucoplaikia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole (section 5.2.1) to eliminate candidial over-lay. Patients should avoid the use of tobacco.

Angular cheilitis Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (Candida spp.) and bacteria (Staphylococcus aureus and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply micon-
azole cream (see p. 737) or sodium fusidate ointment (see p. 735); if the angular cheilitis is unresponsive to treatment, miconazole and hydrocortisone cream or ointment (see p. 707) can be used.

Immunocompromised patients For advice on prevention of fungal infections in immunocompromised patients see p. 374.

Drugs used in oropharyngeal candidiasis Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole (section 5.2.1) is given by mouth for infections that do not respond to topical therapy or where topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole (section 5.2.1) can be used for fluconazole-resistant infections. If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient’s partner may also require treatment to prevent reinfection.

For the role of antisepic mouthwashes in the prevention of oral candidiasis in immunocompromised patients and treatment of denture stomatitis, see section 12.3.4.

**MICONAZOLE**

**Indications** see preparations

**Caution** avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (antifungals, imidazole)

**Contra-indications** with oral gel, impaired swallowing reflex in infants, first 5–6 months of life of an infant born preterm

**Hepatic impairment** avoid

**Pregnancy** manufacturer advises avoid if possible—toxicity at high doses in animal studies

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** nausea, vomiting; rash; with buccal tablets, abdominal pain, including streptococci and staphylococci. Fluconazole (section 5.2.1) is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole (section 5.2.1) can be used for fluconazole-resistant infections. If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient’s partner may also require treatment to prevent reinfection.

For the role of antisepic mouthwashes in the prevention of oral candidiasis in immunocompromised patients and treatment of denture stomatitis, see section 12.3.4.

**Dose**

- see preparations

Daktarim® (Janssen-Cilag)

**Oral gel** sugar-free, orange-flavoured, miconazole 24 mg/mL (20 mg/g). Net price 15-g tube = £2.85, 80-g tube = £4.38. Label: 9, counselling, hold in mouth, after food

**Dose** prevention and treatment of oral and intestinal fungal infections, 5–10 mL in the mouth after food 4 times daily, retained near oral lesions before swallowing. CHILD 4 months–2 years 2.5 mL twice daily; smeared around the mouth, 2–6 years 5 mL.

azole cream (see p. 737) or sodium fusidate ointment (see p. 735); if the angular cheilitis is unresponsive to treatment, miconazole and hydrocortisone cream or ointment (see p. 707) can be used.

**Immunocompromised patients** For advice on prevention of fungal infections in immunocompromised patients see p. 374.

**Drugs used in oropharyngeal candidiasis** Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. 12.3.3 Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

12.3.4 Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chlor-ide mouthwash with an equal volume of warm water. Mouthwash solution-tablets are used to remove unpleasant tastes.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis.

There is no convincing evidence that gargles are effective.

CHLORHEXIDINE GLUCONATE

Indications see under preparations below

Side-effects mucosal irritation (if desquamation occurs, discontinue treatment or dilute mouthwash with an equal volume of water); taste disturbance; reversible brown staining of teeth, and of silicate or composite restorations; tongue discoloration; parotid gland swelling reported

Note Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste, leave an interval of at least 30 minutes between using mouthwash and toothpaste

Chlorhexidine (Non-proprietary)

Mouthwash, chlorhexidine gluconate 0.2%, net price 300 mL = £2.51

Dose oral hygine and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily

Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

Dental prescribing on NHS Chlorhexidine Mouthwash may be prescribed

Corsodyl® (GSK Consumer Healthcare)

Dental gel, chlorhexidine gluconate 1%. Net price 50 g = £1.21

Dose oral hygine and plaque inhibition and gingivitis, brush on the teeth once or twice daily

Oral candidiasis and management of aphthous ulcers, apply to affected areas once or twice daily

Dental prescribing on NHS May be prescribed as Chlorhexidine Gluconate Gel

Mouthwash, chlorhexidine gluconate 0.2%. Net price 300 mL (original or mint) = £2.18, 600 mL (mint) = £3.85

Dose oral hygine and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily

Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

Oral spray, chlorhexidine gluconate 0.2% (mint-flavoured). Net price 60 mL = £4.10

Dose oral hygine and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, apply as required to tooth, gingival, or ulcer surfaces using up to 12 actuations (approx 0.14 mL/actuation) twice daily

Dental prescribing on NHS May be prescribed as Chlorhexidine Oral Spray

Periogard® (Colgate-Palmolive)

Oromucosal solution, alcohol-free, chlorhexidine gluconate 0.2%, net price 300 mL = £1.96

Dose short-term treatment of inflammation of gingival and oral mucosa, ADULT and CHILD over 6 years, rinse mouth with 10 mL for about 1 minute twice daily

Dental prescribing on NHS May be prescribed as Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2%

With chlorobutanol

Eludril® (Fabre)

Mouthwash or gargle, chlorhexidine gluconate 0.1%, chlorobutanol 0.5% (mint-flavoured), net price 90 mL = £1.36, 250 mL = £2.83, 500 mL = £5.06

Dose oral hygiene and plaque inhibition, use 10–15 mL (diluted with warm water in measuring cup provided) 2–3 times daily

Denture dissection, soak previously cleansed dentures in mouthwash (diluted with 2 volumes of water) for 60 minutes

HEXETIDINE

Indications oral hygiene

Side-effects local irritation; very rarely taste disturbance and transient anaesthesia

Oraldene® (McNeil)

Mouthwash or gargle, red or blue-green (mint-flavoured), hexetidine 0.1%. Net price 100 mL = £1.31; 200 mL = £2.02

Dose ADULT and CHILD over 6 years, use 15 mL, undiluted 2–3 times daily

HYDROGEN PEROXIDE

Indications oral hygiene, see notes above

Side-effects hypertherpy of papillae of tongue on prolonged use
12.3.5 Treatment of dry mouth

Hydrogen Peroxide Mouthwash, BP

Mouthwash, consists of Hydrogen Peroxide Solution 6% (= approx. 20 volume) BP

Dose rinse the mouth for 2–3 minutes with 15 mL diluted in half a tablespoonful of warm water 2–3 times daily

Dental prescribing on NHS Hydrogen Peroxide Mouthwash may be prescribed

Peroxyl® (Colgate-Palmolive)

Mouthwash, hydrogen peroxide 1.5%, net price 300 mL = £2.54

Dose rinse the mouth with 10 mL for about 1 minute up to 4 times daily (after meals and at bedtime)

SODIUM CHLORIDE

Indications oral hygiene, see notes above

Sodium Chloride Mouthwash, Compound, BP

Mouthwash, sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with a peppermint flavour.

Dose extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL.

To be diluted with an equal volume of warm water

Dental prescribing on NHS Compound Sodium Chloride Mouthwash may be prescribed

THYMOL

Indications oral hygiene, see notes above

Mouthwash Solution-tablets

Consist of tablets which may contain antimicrobial, colouring, and flavouring agents in a suitable soluble effervescent basis to make a mouthwash suitable for dental purposes. Net price 100-tab pack = £15.09

Dose dissolve 1 tablet in a tablespoonful of warm water

Note Mouthwash solution tablets may contain ingredients such as thymol

Dental prescribing on NHS Mouthwash Solution-tablets may be prescribed

Local treatment

AS Saliva Orthana® (AS Pharma)

Oral spray, gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral. Net price 50-mL bottle = £4.92; 450-mL refill = £34.27

Dose ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray 2–3 times onto oral and pharyngeal mucosa, when required

Dental prescribing on NHS AS Saliva Orthana® Oral Spray may be prescribed

Lozenges, mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral. Net price 30-lozenge pack = £3.50

Dose ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome

Note AS Saliva Orthana® lozenges do not contain fluoride

Dental prescribing on NHS AS Saliva Orthana® Lozenges may be prescribed

Biotine Oralbalance® (GSK)

Saliva replacement gel, lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis, net price 50-g tube = £4.10, 24 × 12.4-mL tube = £30.40 (for hospital use)

Dose ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, apply to gums and tongue as required

Note Avoid use with toothpastes containing detergents (including foam agents)

Dental prescribing on NHS Biotine Oralbalance® Saliva Replacement Gel may be prescribed

BioXtra® (RIS Products)

Gel, lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients, net price 40-mL tube = £3.94, 50-mL spray = £3.94

Dose ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, apply to oral mucosa as required

Dental prescribing on NHS BioXtra® Gel may be prescribed

Glandosane® (Fresenius Kabi)

Aerosol spray, carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75. Net price 50-mL unit (neutral, lemon or peppermint flavoured) = £4.62

Dose ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray onto oral and pharyngeal mucosa as required

Dental prescribing on NHS Glandosane® Aerosol Spray may be prescribed

12.3.5 Treatment of dry mouth

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some anti-psychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene, they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, Salinum® or Xerolit® can be used for any condition giving rise to a dry mouth. Biotine Oralbalance®, BioXtra®, Glandosane®, Saliva Orthana®, and Salivex®, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. Salivex® pastilles, which act locally as salivary stimulants, are also available and have similar ACBS approval. SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

Pilocarpine tablets are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren’s syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.
PILOCARPINE HYDROCHLORIDE

**Indications**  xerostomia following irradiation for head and neck cancer (see also notes above); dry mouth and dry eyes in Sjögren’s syndrome

**Cautions**  asthma and chronic obstructive pulmonary disease (avoid if uncontrolled, see Contra-indications), cardiovascular disease (avoid if uncontrolled); cholelithiasis or biliary-tract disease, peptic ulcer, risk of increased urethral smooth muscle tone and renal colic; maintain adequate fluid intake to avoid dehydration associated with excessive sweating; cognitive or psychiatric disturbances; susceptibility to angle-closure glaucoma; **interactions:** Appendix 1 (parasympathomimetics)

**Counselling**  Blurred vision or dizziness may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting

**Contra-indications**  uncontrolled asthma and chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance); uncontrolled cardiorenal disease; acute iritis

**Pregnancy**  avoid—smooth muscle stimulant; toxicity in animal studies

**Breast-feeding**  manufacturer advises avoid—present in milk in animal studies

**Side-effects**  dyspepsia, diarrhoea, abdominal pain, nausea, vomiting, constipation; flushing, hypotension, palpitation, headache, dizziness, asthma, influenza-like symptoms, sweating; increased urinary frequency; visual disturbances, lacrimation, ocular pain, conjunctivitis; rhinitis; rash, pruritus; less commonly: flushing, urinary urgency

**Dose**  • Xerostomia following irradiation for head and neck cancer, 5 mg 3 times daily with or immediately after meals (last dose always with evening meal); if tolerated but response insufficient after 4 weeks, may be increased to max. 30 mg daily in divided doses; max. therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months; **CHILD** not recommended

• Dry mouth and dry eyes in Sjögren’s syndrome, 5 mg 4 times daily (with meals and at bedtime); if tolerated but response insufficient, may be increased to max. 30 mg daily in divided doses; discontinue if no improvement after 2–3 months; **CHILD** not recommended

**Salagen®**  **(Novartis)**

**Tablets**, f/c, pilocarpine hydrochloride 5 mg. Net price 84-tab pack = £41.14. Label: 21, 27. counselling, driving

13.1 Management of skin conditions

13.1.1 Vehicles

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.
Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. 

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution
The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

### 13.1.2 Suitable quantities for prescribing

<table>
<thead>
<tr>
<th>Area of the Body</th>
<th>Creams and Ointments</th>
<th>Lotions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Face</td>
<td>15–30 g</td>
<td>100 mL</td>
</tr>
<tr>
<td>Both hands</td>
<td>25–50 g</td>
<td>200 mL</td>
</tr>
<tr>
<td>Scalp</td>
<td>50–100 g</td>
<td>200 mL</td>
</tr>
<tr>
<td>Both arms or both legs</td>
<td>100–200 g</td>
<td>200 mL</td>
</tr>
<tr>
<td>Trunk</td>
<td>400 g</td>
<td>500 mL</td>
</tr>
<tr>
<td>Groins and genitalia</td>
<td>15–25 g</td>
<td>100 mL</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations—for suitable quantities of corticosteroid preparations see section 13.4.

### 13.1.3 Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis, p. 197). The following excipients in topical preparations are rarely associated with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance, p. 2.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexamethylenimine chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulphite
- Sorbic acid
- Wool fat and related substances including lanolin

1. Purified versions of wool fat have reduced the problem

### 13.2 Emollient and barrier preparations

#### 13.2.1 Emollients

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis (section 13.5.2). The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Emollients should be applied in the direction of hair growth. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation (section 13.1.3) and this should be suspected if an eczematous reaction
13.2.1 Emollients

Occur. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

### Fire hazard with paraffin-based emollients

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

Preparations such as aqueous cream and emulsifying ointment can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil (section 13.2.1.1) may also be helpful.

Preparations containing an antibacterial (section 13.10) should be avoided unless infection is present or is a frequent complication.

Urea is a hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients. It is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

#### Non-proprietary emollient preparations

**Aqueous Cream, BP**

Cream, emulsifying ointment 30%, phenoxethanol 1% in freshly boiled and cooled purified water, net price 100 g = £1.51, 500 g = £1.86

Excipients include cetostearyl alcohol

1. The BP permits use of alternative antimicrobials provided their identity and concentration are stated on the label.

**Emulsifying Ointment, BP**

Ointment, emulsifying wax 30%, white soft paraffin 50%, liquid paraffin 20%, net price 500 g = £2.22

Excipients include cetostearyl alcohol

**Hydrous Ointment, BP**

Ointment, oily cream, dried magnesium sulphate 0.5%, phenoxethanol 1%, wool alcohols ointment 50%, in freshly boiled and cooled purified water, net price 500 g = £2.92

**Liquid and White Soft Paraffin Ointment, NPF**

Ointment, liquid paraffin 50%, white soft paraffin 50%, net price 500 g = £6.09

**Paraffin, White Soft, BP**

White petroleum jelly, net price 100 g = 51p

**Paraffin, Yellow Soft, BP**

Yellow petroleum jelly, net price 100 g = 49p

#### Proprietary emollient preparations

**Aquamol®** *(Thornton & Ross)*

Cream, containing liquid paraffin, white soft paraffin, net price 50 g = £1.22, 500-g pump pack = £6.40

Excipients include cetostearyl alcohol, chlorocresol

For dry skin conditions

**Aveeno®** *(J&J)*

Cream, colloidal oatmeal in emollient basis, net price 100 mL = £3.78, 300-mL pump pack = £6.80

Excipients include benzyl alcohol, cetyl alcohol, isopropyl palmitate

ACBS: For endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin

**Lotion**, colloidal oatmeal in emollient basis, net price 400 mL = £6.42

Excipients include benzyl alcohol, cetyl alcohol, isopropyl palmitate

ACBS: as for Aveeno® Cream

**Cetraben®** *(Genus)*

Emollient cream, white soft paraffin 13.2%, light liquid paraffin 10.5%, net price 50-g pump pack = £1.40, 150-g pump pack = £3.98, 500-g pump pack = £5.99, 1.05-kg pump pack = £11.62

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

For inflamed, damaged, dry or chapped skin including eczema

**Dermamist®** *(Alliance)*

Spray application, white soft paraffin 10% in a basis containing liquid paraffin, fractionated coconut oil, net price 250-mL pressurised aerosol unit = £5.97

Excipients none as listed in section 13.1.3

For dry skin conditions including eczema, ichthyosis, pruritus of the elderly

Note Flammable

**Diprosone®** *(Schering-Plough)*

Cream, cetomacrogol 2.25%, cetostearyl alcohol 7.2%, liquid paraffin 6%, white soft paraffin 15%, water-miscible basis used for Diprosone® cream, net price 50 g = £1.28; 500-g pump pack = £6.32

Excipients include cetostearyl alcohol, chlorocresol

For dry skin conditions

**Ointment**, liquid paraffin 5%, white soft paraffin 95%, basis used for Diprosone® ointment, net price 50 g = £1.28, 500 g = £5.99

Excipients none as listed in section 13.1.3

For dry skin conditions

**Doublebase®** *(Dermal)*

Gel, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500 g = £5.82

Excipients none as listed in section 13.1.3

For dry, chapped, or itchy skin conditions

**E45®** *(Reckitt Benckiser)*

Cream, light liquid paraffin 12.6%, white soft paraffin 14.5%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in self-emulsifying monostearin, net price 50 g = £1.40, 125 g = £2.55, 350 g = £4.46, 500-g pump pack = £4.89

Excipients include cetri alcohol, hydroxybenzoates (parabens)

For dry skin conditions

**Lotion**, light liquid paraffin 4%, cetomacrogol, white soft paraffin 10%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in glyceryl monostearate, net price 200 mL = £2.42, 500-mL pump pack = £4.50

Excipients include isopropyl palmitate, hydroxybenzoates (parabens), benzyl alcohol

ACBS: for symptomatic relief of dry skin conditions, such as those associated with atopic eczema and contact dermatitis

**Emollin®** *(C D Medical)*

Spray, liquid paraffin 50%, white soft paraffin 50% in aerosol basis, net price 150 mL = £3.74, 240 mL = £5.98

Excipients none as listed in section 13.1.3

For dry skin conditions
13.2.1 Emollients

Epaderm® (Mölnlycke)

- **Cream**, yellow soft paraffin 15%, liquid paraffin 10%, emulsifying wax 5%, net price 50-g pump pack = £1.60, 500-g pump pack = £6.55
- **Exipients** include cetostearyl alcohol, chlorocresol
- For use as an emollient or soap substitute

**Ointment**, emulsifying wax 30%, yellow soft paraffin 30%, liquid paraffin 40%, net price 125 g = £3.72, 500 g = £6.30, 1 kg = £11.61
- **Exipients** include cetostearyl alcohol
- For use as an emollient or soap substitute

Hydromol® (Alliance)

- **Cream**, sodium pilolate 2.5%, liquid paraffin 13.8%, net price 50 g = £2.04, 100 g = £3.80, 500 g = £11.09
- **Exipients** include cetostearyl alcohol, hydroxybenzoates (parabens)
- For dry skin conditions

**Ointment**, yellow soft paraffin 30%, emulsifying wax 30%, liquid paraffin 40%, net price 125 g = £2.79, 500 g = £4.74, 1 kg = £8.81
- **Exipients** include cetostearyl alcohol
- For use as an emollient, bath additive, or soap substitute

**Lipobase®** (Astellas)

- **Cream**, fatty cream basis used for Locoid Lipocream®, net price 50 g = £1.46
- **Exipients** include cetostearyl alcohol, hydroxybenzoates (parabens)
- For dry skin conditions, also for use during treatment with topical corticosteroid and as diluent for Locoid Lipocream®

Oilatum® (Stiefel)

- **Cream**, light liquid paraffin 6%, white soft paraffin 15%, net price 40 g = £1.30, 150 g = £2.46, 500-mL pump pack = £4.99, 1.05-litre pump pack = £9.98
- **Exipients** include benzyl alcohol, cetylstearyl alcohol
- For dry skin conditions

**Oilatum® Junior Cream**, light liquid paraffin 6%, white soft paraffin 15%, 150 g = £3.38, 350 mL = £4.65, 500 mL = £4.99, 1.05-litre pump pack = £9.98
- **Exipients** include benzyl alcohol, cetylstearyl alcohol
- For dry skin conditions

**QV®** (Crawford)

- **Cream**, glycerol 10%, light liquid paraffin 10%, white soft paraffin 5%, net price 100 g = £1.95, 500 g = £5.60
- **Exipients** include cetostearyl alcohol, hydroxybenzoates (parabens)
- For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus

**Lotion**, white soft paraffin 5%, net price 250 mL = £3.00
- **Exipients** include cetostearyl alcohol, hydroxybenzoates (parabens)
- For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus

**Ultrabase®** (Bayer Schering)

- **Cream**, water-miscible, containing liquid paraffin and white soft paraffin, net price 50 g = £1.58, 500-g pump pack = £16.23
- **Exipients** include fragrance, hydroxybenzoates (parabens), disodium edetate, stearyl alcohol
- For dry skin conditions

**Unguentum M®** (Almirall)

- **Cream**, containing saturated neutral oil, liquid paraffin, white soft paraffin, net price 50 g = £1.41, 100 g = £2.78, 200-mL pump pack = £5.50, 500 g = £8.48
- **Exipients** include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid
- For dry skin conditions and nappy rash

**Zerobase®** (Thorton & Ross)

- **Cream**, liquid paraffin 11%, net price 50 g = £1.04, 500-g pump pack = £5.26
- **Exipients** include cetostearyl alcohol, chlorocresol
- For dry skin conditions

**Zerocream®** (Thornton & Ross)

- **Cream**, liquid paraffin 12.6%, white soft paraffin 14.5%, net price 50 g = £1.17, 500-g pump pack = £4.08
- **Exipients** include cetostearyl alcohol, hydroxybenzoates (parabens), lanolin anhydrous
- For dry skin conditions

**Zeroguent®** (Thornton & Ross)

- **Cream**, light liquid paraffin 8%, white soft paraffin 4%, refined soya bean oil 5%, net price 100 g = £2.33, 500 g = £7.07
- **Exipients** include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid
- For dry skin conditions

**Preparations containing urea**

**Aquadrate®** (Alliance)

- **Cream**, urea 10%, net price 100 g = £4.37
- **Exipients** none as listed in section 13.1.3
- **Dose** for dry, scaling and itching skin, apply thinly twice daily

**Balneum®** (Almirall)

- **Cream**, urea 5%, ceramide 0.1%, net price 50-g pump pack = £2.80, 500-g pump pack = £9.80
- **Exipients** include cetostearyl alcohol, polysorbates, propylene glycol
- **Dose** for dry skin conditions, apply twice daily

**Balneum® Plus Cream**, urea 5%, laurmacrogols 3%, net price 100 g = £3.29, 175-g pump pack = £8.33, 500-g pump pack = £16.42
- **Exipients** include benzyl alcohol, polysorbates
- **Dose** for dry, scaling and itching skin, apply twice daily

**Calmidur®** (Galuiderma)

- **Cream**, urea 10%, lactic acid 5%, net price 100 g = £5.70, 500-g pump pack = £27.42
- **Exipients** none as listed in section 13.1.3
- **Dose** for dry, scaling and itching skin, apply a thick layer for 3-5 minutes, massage into area, and remove excess, usually twice daily. Use half-strength cream for 1 week if stinging occurs
- **Note** Can be diluted with aqueous cream (life of diluted cream 14 days)

**Dermatonics Heel Balm®** (Dermatonics)

- **Cream**, urea 25%, net price 75 mL = £4.00, 200 mL = £9.50
- **Exipients** include beeswax, lanolin
- **Dose** for dry skin on soles of feet, apply twice daily

**E45® Itch Relief Cream** (Reckitt Benckiser)

- **Cream**, urea 5%, macrogol lauryl ether 3%, net price 50 g = £2.55, 100 g = £3.47, 500-g pump pack = £14.99
- **Exipients** include benzyl alcohol, polysorbates
- **Dose** for dry, scaling, and itching skin, apply twice daily

**Eucerin® Intensive** (Beiersdorf)

- **Cream**, urea 10%, net price 100 mL = £7.59
- **Exipients** include benzyl alcohol, isopropyl palmitate, wool fat
- **Dose** for dry skin conditions including eczema, ichthyosis, xeroderma, hyperkeratosis, apply thinly and rub into area twice daily

**Lotion**, urea 10%, net price 250 mL = £7.93
- **Exipients** include benzyl alcohol, polysorbates
- **Dose** for dry skin conditions including eczema, ichthyosis, xeroderma, hyperkeratosis, apply sparingly and rub into area twice daily

**Hydromol® Intensive** (Alliance)

- **Cream**, urea 10%, net price 30 g = £1.64, 100 g = £4.37
- **Exipients** none as listed in section 13.1.3
- **Dose** for dry, scaling and itching skin, apply thinly twice daily

**Nutraplus®** (Galderma)

- **Cream**, urea 10%, net price 100 g = £4.37
- **Exipients** include hydroxybenzoates (parabens), propylene glycol
- **Dose** for dry, scaling and itching skin, apply 2-3 times daily
13.2.1 Emollients

With antimicrobials

Dermol® (Dermal)

Cream, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, isopropyl myristate 10%, liquid paraffin 10%, net price 100-g tube = £2.86, 500-g pump pack = £6.63

Excipients include cetostearyl alcohol

Dose for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

Dermol® 500 Lotion, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 500-mL pump pack = £6.03

Excipients include cetostearyl alcohol

Dose for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

Eczezl® (Genus)

Cream, chlorhexidine gluconate 1% in emollient basis, net price 250 mL = £3.70

Excipients include cetostearyl alcohol

Dose for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

13.2.1.1 Emollient bath additives and shower preparations

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin and rinsed off. In dry skin conditions soap should be avoided (see section 13.2.1 for soap substitutes). The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washtub; recommended bath additive quantities for children reflect this.

These preparations make skin and surfaces slippery—particularly care is needed when bathing

Aveeno® (J&J)

Aveeno® Bath oil, colloidal oatmeal, white oat fraction in emollient basis, net price 250 mL = £4.28

Excipients include beeswax, fragrance

Dose ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin, add 20–40 mL/bath or apply to wet skin and rinse

Aveeno Colloidal® Bath additive, oatmeal, white oat fraction in emollient basis, net price 10 × 50-g sachets = £7.33, Baby Bath Additive, 10 × 15-g sachets = £4.39

Excipients none as listed in section 13.1.3

Dose ACBS: as for Aveeno® Bath oil, add 50 g/bath (INFANT and CHILD under 12 years, 15 g)

Balneum® (Almirall)

Balneum® bath oil, soya oil 84.75%, net price 200 mL = £2.48, 500 mL = £5.38, 1 litre = £10.39

Excipients include butylated hydroxytoluene, propylene glycol, fragrance

Dose for dry skin conditions including those associated with dermatitis and eczema; add 20–60 mL/bath (INFANT 5–15 mL) do not use undiluted

Balneum Plus® bath oil, soya oil 82.95%, mixed lauromacrogols 15%, net price 500 mL = £6.66

Excipients include butylated hydroxytoluene, propylene glycol, fragrance

Dose for dry skin conditions including those associated with dermatitis and eczema where pruritus also experienced; add 20 mL/bath (INFANT 5 mL) or apply to wet skin and rinse

Cetraben® (Genus)

Emollient bath additive, light liquid paraffin 82.8%, net price 500 mL = £5.75

Excipients none as listed in section 13.1.3

Dose for dry skin conditions, including eczema, add 1–2 capfuls/bath (CHILD ½–1 capful) or apply to wet skin and rinse

Dermalo® (Dermal)

Bath emollient, acetylated wool alcohols 5%, liquid paraffin 65%, net price 500 mL = £3.44

Excipients none as listed in section 13.1.3

Dose for dermatitis, dry skin conditions including ichthyosis and pruritus of the elderly; add 15–20 mL/bath (INFANT and CHILD 5–10 mL) or apply to wet skin and rinse

Diprobas® (Schering-Plough)

Bath additive, isopropyl myristate 30%, light liquid paraffin 46%, net price 500 mL = £6.71

Excipients none as listed in section 13.1.3

Dose for dry skin conditions including dermatitis and eczema; add 25–50 mL/bath (INFANT 10 mL); do not use undiluted

Doublebase® (Dermal)

Emollient bath additive, liquid paraffin 65%, net price 500 mL = £5.45

Excipients include cetostearyl alcohol

Dose for dry skin conditions including dermatitis, ichthyosis, and pruritus of the elderly; add 15–20 mL/bath (INFANT and CHILD 5–10 mL)

Emollient shower gel, isopropyl myristate 15%, light liquid paraffin 15%, net price 200 g = £5.21

Excipients none as listed in section 13.1.3

For dry, chapped, or itchy skin conditions

Note: Also available as Doublebase® Emollient Wash Gel

E45® (Reckitt Benckiser)

Emollient bath oil, cetyl dimethicone 5%, liquid paraffin 91%, net price 250 mL = £3.19, 500 mL = £5.11

Excipients none as listed in section 13.1.3

Dose ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin; add 15 mL/bath (CHILD 5–10 mL) or apply to wet skin and rinse

Emollient wash cream, soap substitute, zinc oxide 5% in an emollient basis, net price 250-mL pump pack = £3.19

Excipients none as listed in section 13.1.3

ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis and senile pruritus (pruritus of the elderly) associated with dry skin

Hydromol® (Alliance)

Bath and shower emollient, isopropyl myristate 13%, light liquid paraffin 37.8%, net price 350 mL = £3.61, 500 mL = £4.11, 1 litre = £8.19

Excipients none as listed in section 13.1.3

Dose ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin

Oiltatum® (Stiefel)

Emollient bath additive (emulsion), light liquid paraffin 63.4%, net price 250 mL = £2.75, 500 mL = £4.57

Excipients include acetylated lanolin alcohols, isopropyl palmitate, fragrance

Dose for dry skin conditions including dermatitis, pruritus of the elderly and ichthyosis; add 1–3 capfuls/bath (INFANT ½–2 capfuls) or apply to wet skin and rinse

Junior bath additive, light liquid paraffin 63.4%, net price 150 mL = £2.82, 250 mL = £3.25, 500 mL = £5.10, 600 mL = £5.89

Excipients include acetylated lanolin alcohols, isopropyl palmitate

Dose for dry skin conditions including dermatitis, pruritus of the elderly and ichthyosis; add 1–3 capfuls/bath (INFANT 0.5–2 capfuls) or apply to wet skin and rinse

Shower emollient (gel), light liquid paraffin 70%, net price (with fragrance or fragrance-free) 150 g = £5.15

For dry skin conditions including dermatitis
13.2.2 Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. They are no substitute for adequate nursing care and it is doubtful if they are any more effective than zinc ointments.

Nappy rash
Barrier creams and ointments are used for protection against nappy rash which is usually a local dermatitis. The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation can be helpful. If the rash is associated with a fungal infection, an antifungal cream such as clotrimazole cream (section 13.10.2) is useful. A mild corticosteroid such as hydrocortisone 1% is useful in moderate to severe inflammation, but it should be avoided in neonates. The barrier preparation is applied after the corticosteroid preparation, but it should be avoided in neonates. The barrier preparation is usually referred to as an antifungal and antibacterial drug (section 13.4) if there is considerable inflammation, erosion, and infection. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and water-proof pants may increase absorption for cautions, see p. 708).

Non-proprietary barrier preparations

Zinc Cream, BP
Cream, zinc oxide 32%, arachis (peanut) oil 32%, calcium hydroxide 0.045%, oleic acid 0.5%, wool fat 8%, in freshly boiled and cooled purified water, net price 50 g = 75p

For nappy and urinary rash and eczematous conditions

Zinc Ointment, BP
Ointment, zinc oxide 15%, in Simple Ointment BP 1988 (which contains wool fat 5%, hard paraffin 5%, cetostearyl alcohol 9%, white soft paraffin 85%), net price 25 g = 30p

For nappy and urinary rash and eczematous conditions

Zinc and Castor Oil Ointment, BP
Ointment, zinc oxide 7.5%, castor oil 50%, arachis (peanut) oil 30.5%, white beeswax 10%, cetostearyl alcohol 2%, net price 500 g = £2.93

For nappy and urinary rash
13.3 Topical local anaesthetics and antipruritics

Proprietary barrier preparations

Conotrate® (Astellas)

Cream, benzalkonium chloride 0.1%, dimeticonic ‘350’, 22%, net price 100 g = £8.80, 500 g = £35.51

Excipients include cetostearyl alcohol, fragrance

For nappy and urinary rash and pressure sores

Drapolene® (Chefaro UK)

Cream, benzalkonium chloride 0.01%, cetrimide 0.2% in a basis containing white soft paraffin, cetyl alcohol and wool fat, net price 100 g = £1.54, 200 g = £2.50, 350 g = £3.75

Excipients include cetyl alcohol, chlorocresol, wool fat

For nappy and urinary rash, minor wounds

Medicaid® (PC)

Cream, cetrimide 0.5% in a basis containing liquid liquid paraffin, white soft paraffin, cetostearyl alcohol, glyceryl monostearate, net price 50 g = £1.69

Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens), zinc oxide, wool fat

For nappy rash, minor burns and abrasions

Metanium® (Thorn & Ross)

Ointment, titanium dioxide 20%, titanium oxide 5%, titanium salicylate 3% in a basis containing dimeticone, liquid paraffin, white soft paraffin, and benzoin tincture, net price 30 g = £2.01

Excipients none as listed in section 13.1.5

For nappy rash

Morolin® (Actavis)

Ointment, cod-liver oil 11.4%, zinc oxide 38%, in a basis containing liquid paraffin and yellow soft paraffin, net price 50 g = £1.91

Excipients include wool fat derivative

For minor wounds, varicose ulcers, pressure sores, eczema and nappy rash

Siopel® (Derma UK)

Barrier cream, dimeticonic ‘1000’ 10%, cetrimide 0.3%, arachis (peanut) oil, net price 50 g = £2.15

Excipients include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens), calamine

For protection against water-soluble irritants

Sprilon® (Ayrton Saunders)

Spray application, dimeticonic 1.04%, zinc oxide 12.5%, in a basis containing wool alcohols, cetostearyl alcohol, dextran, white soft paraffin, liquid paraffin, propellants, net price 115-g pressurised aerosol unit = £3.54

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), wool fat

For urinary rash, pressure sores, leg ulcers, moist eczema, fissures, cutaneous and stomatocystic care

Note: Flammable

Sudocrem® (Forest)

Cream, benzyl alcohol 0.39%, benzyl benzoate 1.01%, benzyl cinnamate 0.15%, hydrous wool fat (hypoa- lergenic lanolin) 4%, zinc oxide 15.25%, net price 30 g = £1.13, 60 g = £1.25, 125 g = £1.84, 250 g = £3.09, 400 g = £4.34

Excipients include beeswax (synthetic), propylene glycol, butylated hydroxyanisole, fragrance

For nappy rash and pressure sores

Vasogen® (Forest)

Barrier cream, dimeticonic 20%, calamine 1.5%, zinc oxide 7.5%, net price 100 g = £2.72

Excipients include hydroxybenzoates (parabens), wool fat

For nappy rash, pressure sores, lichen simplex and eczematous care

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible the underlying causes should be treated. An emollient (section 13.2.1) may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient. Levomethenol cream can be used to relieve pruritus; it exerts a cooling effect on the skin. For advice on the treatment of pruritus in palliative care, see p. 22.

Preparations containing crotamiton are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.

A topical preparation containing doxepin 5% is licensed for the relief of pruritus in eczema; it can cause drowsi- ness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine is the treatment of choice (section 1.9.2).

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause sensitisation. For insect stings and insect bites, a short course of a topical corticosteroid is appropriate. Short-term treatment with a sedating antihistamine (section 3.4.1) may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

For preparations used in pruritus ani, see section 1.7.1.

Calamine

Indications

Pruritus

Calamine (Non-proprietary)

Aqueous cream, calamine 4%, zinc oxide 3%, liquid paraffin 20%, self-emulsifying glyceryl monostearate 5%, cetomacrogol emulsifying wax 5%, phenox- yethanol 0.5%, freshly boiled and cooled purified water 62.5%, net price 100 mL = 64p.

Lotion (cutaneous suspension), calamine 15%, zinc oxide 5%, glycerol 5%, bentonite 3%, sodium citrate 0.5%, liquefied petrol 0.5%, in freshly boiled and cooled purified water, net price 200 mL = 63p.

Oily lotion (BP 1980), calamine 5%, arachis (peanut) oil 50%, oleic acid 0.5%, wool fat 1%, in calcium hydroxide solution, net price 200 mL = £1.57

Crotamiton

Indications

Pruritus (including pruritus after scabies—section 13.10.4); see notes above

Cautions

Avoid use near eyes and broken skin; use on doctor’s advice for children under 3 years

Contra-indications

acute exudative dermatoses

Dose

Pruritus, apply 2–3 times daily; CHILD under 3 years, apply once daily
Eurax® (Novartis Consumer Health)

**Cream**, crotamiton 10%, net price 30 g = £2.38, 100 g = £4.15

**Excipients** include beeswax, fragrance, hydroxybenzoates (parabens), stearyl alcohol.

**Lotion**, crotamiton 10%, net price 100 mL = £3.14

**Excipients** include cetyl alcohol, fragrance, propylene glycol, sorbic acid, stearyl alcohol.

### 13.4 Topical corticosteroids

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema (section 13.5.1), contact dermatitis, insect stings (p. 42), and eczema of scabies (section 13.10.4). Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are of no value in the treatment of urticaria and they are contra-indicated in rosacea; they may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). Topical use of potent corticosteroids on widespread psoriasis can lead to systemic as well as to local side-effects. It is reasonable, however, to prescribe a mild to moderate topical corticosteroid for a short period (2–4 weeks) for flexural and facial psoriasis and to use a more potent corticosteroid such as beta-methasone or fluocinonide for psoriasis of the scalp, palms, or soles (see below for cautions in psoriasis).

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections (section 10.1.2.2) may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

### Perioral lesions

Hydrocortisone cream 1% can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone and miconazole cream or ointment is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis (see also p. 695). Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including *streptococci* and *staphylococci*.

**Children** Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 1% ointment or cream is useful for treating nappy rash (section 13.2.2) and for

---

**DOXEPIN HYDROCHLORIDE**

**Indications** pruritus in eczema; depressive illness (section 4.3.1)

**Cautions** susceptibility to angle-closure glaucoma, urinary retention, mania, cardiac arrhythmias, severe heart disease; avoid application to large areas; interactions: Appendix 1 (antidepressants, tricyclic)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** manufacturer advises caution in severe liver disease

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** drowsiness; local burning, stinging, irritation, tingling and rash; systemic side-effects such as antimuscarinic effects, headache, fever, dizziness, gastro-intestinal disturbances also reported

**Dose**

- **ADULT and CHILD** over 12 years, apply thinly 3–4 times daily; usual max. 3 g per application; usual total max. 12 g daily; coverage should be less than 10% of body surface area

**Xepin® (CHS)**

**Cream, doxepin hydrochloride 5%**, net price 30 g = £11.70; Label: 2, 10, patient information leaflet

**Excipients** include benzyl alcohol

---

**LEVOMENTHOL**

**Indications** pruritus

**Levomenthol Cream, BP** (also in Anti-pers Cream)

**Cream, levomenthol 0.5%**, net price 500 g = £15.30; 1% 100 g = £3.67, 500 g = £15.30; 2% 50-mL pump pack = £3.19, 500 g = £15.30

**Dose** apply 1–2 times daily

---

**TOPICAL LOCAL ANAESTHETICS**

**Indications** relief of local pain, see notes above. See section 15.2 for use in surface anaesthesia

**Cautions** occasionally cause hypersensitivity

**Note** Topical local anaesthetic preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than about 3 days; not generally suitable for young children

---

**TOPICAL ANTIHISTAMINES**

**Indications** see notes above

**Cautions** may cause hypersensitivity; avoid in eczema; photosensitivity (diphenhydramine); not recommended for longer than 3 days

---

**TOPICAL CORTICOSTEROIDS**

**Indications** see notes above

**Cautions** may cause hypersensitivity; avoid in eczema; photosensitivity (diphenhydramine); not recommended for longer than 3 days

---
atopic eczema in childhood (section 13.5.1). A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Continuous daily application of a mild corticosteroid such as hydrocortisone 1% is equivalent to a potent corticosteroid such as betamethasone 0.1% applied intermittently. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient’s condition.

Choice of formulation Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polythene or hydrocolloid dressings increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF topical corticosteroids for the skin are categorised as ‘mild’, ‘moderately potent’, ‘potent’ or ‘very potent’ (see p. 709); the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

Cautions Avoid prolonged use of a topical corticosteroid on the face (and keep away from eyes). In children avoid prolonged use and use potent or very potent corticosteroids under specialist supervision; eradication of infantile sebaceous naevi is useful but the duration of treatment may be uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

These amounts are usually suitable for an adult for a single daily application for 2 weeks.

If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. The potency of each topical corticosteroid (see Topical Corticosteroid Preparation Potencies, below) should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

Compound preparations The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.
Hydrocortisone

Apply thinly 1–2 times daily.

Dose

● Apply thinly 1–2 times daily

Hydrocortisone (Non-proprietary) Cream, hydrocortisone 0.5%, net price, 15 g = £1.92, 30 g = £5.19; 1%, 15 g = £1.64, 30 g = £1.99, 50 g = £4.06; 2.5%, 15 g = £1.92, 30 g = £2.38; 1%, 50 g = £7.03. Label: 28, counselling, application, see p. 708. Potency: mild

Dental prescribing on NHS

Hydrocortisone Cream 1% 15 g may be prescribed

Ointment, hydrocortisone 0.5%, net price 15 g = £3.05, 30 g = £5.23; 1%, 15 g = £3.34, 30 g = £2.70, 50 g = £6.67; 2.5%, 15 g = £23.78. Label: 28, counselling, application, see p. 708. Potency: mild

When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied

Over-the-counter hydrocortisone preparations

Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot); over-the-counter hydrocortisone preparations containing clotrimazole or miconazole nitrate can be sold to the public for athlete’s foot and candidal intertrigo

Proprietary hydrocortisone preparations

Dioderm® (Dermal) Cream, hydrocortisone 0.1%, net price 30 g = £2.39. Label: 28, counselling, application, see p. 708. Potency: mild

Note Although this contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP

Mildison® (Astellas) Lipocream, hydrocortisone 1%, net price 30 g = £1.71. Label: 28, counselling, application, see p. 708. Potency: mild

Compound preparations

Compound preparations with coal tar see section 13.5.2

Alphaderm® (Alliance) Cream, hydrocortisone 1%, urea 10%, net price 30 g = £2.38; 100 g = £7.03. Label: 28, counselling, application, see p. 708. Potency: moderate

Calmurid HC® (Galderma) Cream, hydrocortisone 1%, urea 10%, lactic acid 5%, net price 30 g = £2.80, 50 g = £4.67. Label: 28, counselling, application, see p. 708. Potency: moderate

Eurax-Hydrocortisone® (Novartis Consumer Health) Cream, hydrocortisone 0.25%, crotamiton 10%, net price 30 g = £8.7. Label: 28, counselling, application, see p. 708. Potency: mild

1. A 15-g tube is on sale to the public for treatment of contact dermatitis and insect bites

With antimicrobials

See notes above for comment on compound preparations

Canesten HC® (Bayer Consumer Care) Cream, hydrocortisone 1%, clotrimazole 1%, net price 30 g = £2.42. Label: 28, counselling, application, see p. 708. Potency: mild

Exipients include benzyl alcohol, cetostearyl alcohol, crotamiton and hydrocortisone

1. A 15-g tube is on sale to the public for the treatment of athlete’s foot and fungal infection of skin folds with associated inflammation

Daktacort® (Janssen-Cilag) Cream, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.28. Label: 28, counselling, application, see p. 708. Potency: mild

Exipients include butylated hydroxyanisole, disodium edetate

Dental prescribing on NHS May be prescribed as Miconazole and Hydrocortisone Cream for max. 7 days

Note A 15-g tube is on sale to the public for the treatment of athlete’s foot and candidal intertrigo
**HYDROCORTISONE BUTYRATE**

**Indications**

Severe inflammatory skin disorders such as eczema unresponsive to less potent corticosteroids; psoriasis, see notes above; use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression.

**Dose**

Apply thinly 1–2 times daily.

**Contra-indications**

See notes above.

**Site-effects**

See notes above.

**Notes**

Thin; apply sparingly.

**Clobetasol Propionate**

**Indications**

- short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions**

- see notes above

**Contra-indications**

- see notes above

**Side-effects**

- see notes above

**Dose**

- Apply thinly 1–2 times daily for up to 4 weeks; max. 50 g of 0.05% preparation per week

**Clarelux** (Fabre) (FR)

- Foam (= scalp application), clobetasol propionate 0.05%, net price 100 g = £11.06. | Label: 15, 28, counselling, application, see p. 708. | Potency: very potent |

**Dermovate** (GSK) (FR)

- Cream, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. | Label: 28, counselling, application, see p. 708. | Potency: very potent |

**Note**

- Stains clothing

- Flammable

- Apply directly to scalp lesions (foam begins to subside immediately on contact with skin)
13.4 Topical corticosteroids

Etivex® (Galderma) 
**Shampoo**
clobetasol propionate 0.05%, net price 125 mL = £15.43. Label: 28, counselling, application, see p. 708. Potency: very potent
*Excipients* none as listed in section 13.1.3

Dose moderate scalp psoriasis, AD/OUT over 18 years, apply thinly once daily, rinse off after 15 minutes; reduce frequency of application after clinical improvement; max. duration of treatment 4 weeks

■ With antimicrobials
See notes above for comment on compound preparations

Dermovate-NN® (Chemidex)

**Cream**
clobetasol propionate 0.05%, neomycin sulphate 0.5%, nystatin 100 000 units/g, net price 30 g = £3.91. Label: 28, counselling, application, see p. 708. Potency: very potent
*Excipients* include arachis (peanut) oil, beeswax or beeswax substitute

Ointment
clobetasol propionate 0.05%, neomycin sulphate 0.5%, nystatin 100 000 units/g, in a paraffin base, net price 30 g = £3.91. Label: 28, counselling, application, see p. 708. Potency: very potent
*Excipients* none as listed in section 13.1.3

Clobetasone butyrate

Indications eczemas and dermatitis of all types; maintenance between courses of more potent corticosteroids

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

■ Apply thinly 1–2 times daily

**Eumovate** (GSK)

**Cream**
clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 708. Potency: moderate
*Excipients* include benzyl alcohol, cetostearyl alcohol, chlorocresol

Ointment
clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 708. Potency: moderate
*Excipients* none as listed in section 13.1.3

1. Cream can be sold to the public for short-term symptomatic treatment and control of patches of eczema and dermatitis (but not seborrhoeic dermatitis) in adults and children over 12 years provided pack does not contain more than 15 g

■ With antimicrobials
See notes above for comment on compound preparations

Trimovate® (GSK)

**Cream**
clobetasone butyrate 0.05%, oxytetracycline 3% (as calcium salt), nystatin 100 000 units/g, net price 30 g = £3.29. Label: 28, counselling, application, see p. 708. Potency: moderate
*Excipients* include cetostearyl alcohol, chlorocresol, sodium metabsulphate

Note Stains clothing

Aureocort® (Goldshield) n

Ointment, triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3%, in an anhydrous greasy basis containing wool fat and white soft paraffin, net price 15 g = £2.70. Label: 28, counselling, application, see p. 708. Potency: potent

Excipients include wool fat

Note: Stains clothing

13.5 Preparations for eczema

13.5.1 Preparations for eczema

13.5.2 Preparations for psoriasis

13.5.3 Drugs affecting the immune response

13.5 Preparations for eczema

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic different types may co-exist. Lichenification, due to influence treatment. The main types of eczema are

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application (section 13.2.1) and with a bath emollient (section 13.2.1.1) can also be used; antiseptic shampoos (section 13.9) can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug (section 5.3.2.1) is indicated.

The management of seborrhoeic dermatitis is described below.

Management of other features of eczema Lichenification, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing ichthammol paste (to reduce pruritus) and other substances such as zinc oxide can be applied over the corticosteroid or emollient. Coal tar (section 13.5.2) and ichthammol can be useful in some cases of chronic eczema.

A non-sedating antihistamine (section 3.4.1) may be of some value in relieving severe itching or urticaria associated with eczema. A sedating antihistamine (section 3.4.1) can be used if itching causes sleep disturbance.

Exudative (‘weeping’) eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment (see above). Potassium permanganate solution (1 in 10 000) can be used in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system (section 13.5.3). Alitretinoin (see p. 715) is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Seborrhoeic dermatitis Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast Malassezia and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole and coal tar, section 13.9) and combinations of mild corticosteroids with suitable antimicrobials (section 13.4) are used.
Topical preparations for eczema

ICHTHAMMOL

Indications chronic lichenified eczema
Side-effects skin irritation
Dose
• Apply 1–3 times daily

Icthammol Ointment, BP 1980
Ointment, ichthammol 10%, yellow soft paraffin 45%, wool fat 45%
Zinc and Icthammol Cream, BP
Cream, ichthammol 5%, cetostearyl alcohol 3%, wool fat 10%, in zinc cream
Zinc Paste and Icthammol Bandage, BP 1993
See Appendix 8 (section A8.8.9)

Oral retinoid for eczema

The retinoid, alitretinoin, is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pannophyly.

Alitretinoin should be prescribed only by, or under the supervision of, a consultant dermatologist.

Alitretinoin is teratogenic and must not be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician. See also Pregnancy Prevention under Cautions, below.

NICE guidance
Alitretinoin for the treatment of severe chronic hand eczema in adults (August 2009)
Alitretinoin is recommended for the treatment of severe chronic hand eczema that has not responded to potent topical corticosteroids. Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after 12 weeks, or if an adequate response has not been achieved by 24 weeks.

ALITRETINOIN

Indications severe chronic hand eczema refractory to potent topical corticosteroids
Cautions avoid blood donation during treatment and for at least 1 month after stopping treatment; monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia; history of depression; dry eye syndrome; interactions: Appendix 1 (retinoids)

Pregnancy prevention In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Each prescription for alitretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment

Contra-indications uncontrolled hyperlipidaemia; uncontrolled hypothyroidism; hypervitaminosis A

Hepatic impairment manufacturer advises avoid—no information available

Renal impairment manufacturer advises avoid in severe impairment—no information available

Pregnancy avoid—teratogenic; effective contraception must be used—see Pregnancy Prevention above

Breast-feeding manufacturer advises avoid

Side-effects raised serum concentration of triglycerides and of cholesterol (risk of pancreatitis if triglycerides above 9 mmol/litre), flushing; headache; changes in thyroid function tests; anaemia; myalgia, raised creatine kinase, arthralgia; conjunctivitis, dry eyes (may respond to lubricating eye ointment or tear replacement therapy)—sometimes decreased tolerance to contact lenses, eye irritation; dryness of skin and lips, cheilitis, erythema, alopecia; less commonly epistaxis, hyperosmosis, ankylosing spondylitis, blurred vision, cataracts, pruritus, and astecotic eczema; rarely benign intracranial hypertension (discontinue if severe headache, nausea, vomiting, papilloedema, or visual disturbances occur) and vasculitis; also reported keratitis and impaired night vision

Dose
• ADULT over 18 years, 30 mg once daily, reduced to 10 mg once daily if not tolerated; patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease, initially 10 mg once daily, increased if necessary up to max. 30 mg daily

Note Duration of treatment 12–24 weeks; discontinue if no response after 12 weeks. Course may be repeated in those who relapse. See also Pregnancy Prevention, above

Toctino (Basilea) ▼ ▼ ▼ 30-cap pack = £411.43; 30 mg (red-brown), 30-cap pack = £411.43. Label: 10, patient information leaflet, 11, 21

13.5.2 Preparations for psoriasis

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp. For mild psoriasis, reassurance and treatment with an emollient may be all that is necessary.

Occasionally psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

Emollients (section 13.2.1), in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis. They are particularly useful in inflammatory psoriasis and in plaque psoriasis of palms and soles, in which irritant factors can perpe- tuate the condition. Emollients are useful adjuncts to other more specific treatment.
More specific topical treatment for chronic stable plaque psoriasis on extensor surfaces of trunk and limbs involves the use of vitamin D analogues, coal tar, dithranol, and the retinoid tazarotene. However, they can irritate the skin and are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Widespread unstable psoriasis of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute inflammatory psoriasis with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcipotriol is an active form of vitamin D. Vitamin D and its analogues are used as first-line treatment for plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcipotriol are less likely to irritate.

Coal tar has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscalping properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleanser extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. It should be applied to chronic extensor plaques only, carefully avoiding normal skin. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes (‘short contact’). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable. When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards.

Tazarotene, a retinoid, seems to be less effective than calcipotriol with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin. Tazarotene is clean and odourless.

A topical corticosteroid (section 13.4) is not generally suitable as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis). However, it may be appropriate to treat psoriasis in specific sites, such as the face and flexures, usually with a mild corticosteroid, and psoriasis of the scalp, palms, and soles with a potent corticosteroid.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. Eczema co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent. This requires softening with an emollient ointment, cream, or oil and usually combined with salicylic acid as a keratolytic.

Some preparations prescribed for psoriasis affecting the scalp combine salicylic acid with coal tar or sulphur. Preparations containing salicylic acid, sulphur, and coal tar are available as proprietary products. The product should be applied generously and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing it off. If a corticosteroid lotion or gel is required (e.g. for itch), it can be used in the morning.

Phototherapy Phototherapy is available in specialist centres under the supervision of a dermatologist. Ultraviolet B (UVB) radiation is usually effective for chronic stable psoriasis and for guttate psoriasis. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including localised palmoplantar pustular psoriasis. Early adverse effects include photoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin (see below) and drugs that affect the immune response (such as ciclosporin and methotrexate, section 13.5.3).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

Acitretin, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is psoriasis, but it is also used in disorders of keratinisation such as severe
Darier’s disease (keratosis follicularis), and some forms of ichthyosis. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 to 6 weeks or longer. The manufacturers of acitretin do not recommend continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective). Common side-effects derive from its widespread but reversible effects on epithelia, such as dry and cracking lips, dry skin and mucosal surfaces, hair thinning, paronychia, and soft and sticky palms and soles.

Topical preparations for psoriasis

Vitamin D and analogues

Calcipotriol, calcitriol, and tacalcitol are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia). Local skin reactions (itching, erythema, burning, paraesthesia, dermatitis) are common. Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas. Aggravation of psoriasis has also been reported.

CALCIPOTRIOL

Indications see under Dose

Cautions see notes above; avoid use on face; avoid excessive exposure to sunlight and sunlamps

Contra-indications see notes above

Pregnancy manufacturers advise avoid unless essential

Breast-feeding no information available

Side-effects see notes above; also photosensitivity, dry skin; rarely facial or perioral dermatitis, skin atrophy

Dose

- Plaque psoriasis, apply cream or ointment once or twice daily; max. 100 g weekly (less with scalp solution, see below); CHILD over 6 years, apply twice daily; 6–12 years max. 50 g weekly; over 12 years max. 75 g weekly.

Note Patient information leaflets for Dovonex® cream and ointment advise liberal application (but note max. recommended weekly dose, above)

- Scalp psoriasis, apply scalp solution twice daily; max. 60 mL weekly (less with cream or ointment, see below); CHILD under 18 years see BNF for Children

Note When preparations used together max. total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with cream or ointment 30 g or cream or ointment 60 g with scalp solution 30 mL)

Calcipotriol (Non-proprietary) (Calcipotriol, calcitriol 50 micrograms/g, net price 120 g = £24.04

Note Not licensed for use in children under 18 years

Scalp solution, calcipotriol 50 micrograms/mL, net price 60 mL = £12.53, 120 mL = £26.07

Dovonex® (LEO) (Calcipotriol, calcitriol 50 micrograms/g, net price 120 g = £23.10

Excipients include cetostearyl alcohol, disodium edetate

Ointment, calcipotriol 50 micrograms/g, net price 120 g = £23.10

Excipients include propylene glycol

With betamethasone

For prescribing information and for comment on the limited role of corticosteroids in psoriasis, see section 13.4.

Dovobet® (LEO) (Calcipotriol, calcitriol (as dipropionate) 0.05%, calcitriol (as monohydrate) 50 micrograms/g, net price 60 g = £32.99, 120 g = £61.27. Label: 28

Excipients note as listed in section 13.13

Dose stable plaque psoriasis, apply once daily to max. 30% of body surface (max. 15 g daily, max. 100 g weekly) for 4 weeks; if necessary, subsequent courses repeated on the advice of a specialist. CHILD under 18 years see BNF for Children

Gel, betamethasone (as dipropionate) 0.05%, calcitriol (as monohydrate) 50 micrograms/g, net price 60 g = £36.50, 2 x 60 g = £67.79. Label: 28

Excipients include butylated hydroxytoluene

Dose scalp psoriasis, ADULT over 18 years, apply 1–4 g to scalp once daily, shampoo off after leaving on scalp overnight or during day; usual duration of therapy 4 weeks; if necessary, subsequent courses repeated on the advice of a specialist

Mild to moderate plaque psoriasis, ADULT over 18 years, apply once daily to max. 30% of body surface (max. 15 g daily, max. 100 g weekly) for 8 weeks; if necessary, subsequent courses repeated on the advice of a specialist

Note When different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week

Xamiol® (LEO) (Calcipotriol, calcitriol (as dipropionate) 0.05%, calcitriol (as monohydrate) 50 micrograms/g, net price 60 g = £36.50, 120 g = £67.79. Label: 28

Excipients include butylated hydroxytoluene

Dose scalp psoriasis, ADULT over 18 years, apply 1–4 g to scalp once daily, shampoo off after leaving on scalp overnight or during day; usual duration of therapy 4 weeks; if necessary, subsequent courses repeated on the advice of a specialist

Mild to moderate plaque psoriasis, ADULT over 18 years, apply once daily to max. 30% of body surface (max. 15 g daily, max. 100 g weekly) for 8 weeks; if necessary, subsequent courses repeated on the advice of a specialist

Note When different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week

CALCITRIOL (1,25-Dihydroxycholecalciferol)

Indications mild to moderate plaque psoriasis

Cautions see notes above

Contra-indications see notes above; do not apply under occlusion

Hepatic impairment manufacturer advises avoid—no information available

Renal impairment manufacturer advises avoid—no information available

Pregnancy avoid—use in restricted amounts if clearly necessary (risk of significant systemic absorption; monitor urine- and plasma-calcium concentration)

Breast-feeding manufacturer advises avoid

Side-effects see notes above
TACALCITOL

Indications plaque psoriasis

Cautions see notes above; avoid eyes; monitor plasma calcium if risk of hypercalcaemia; if used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime

Contra-indications see notes above

Renal impairment monitor serum-calcium concentration

Pregnancy manufacturer advises avoid unless no safer alternative—no information available

Breast-feeding manufacturer advises avoid application to breast area; no information available on presence in milk

Side-effects see notes above

Dose

ADULT and CHILD over 12 years, apply once daily preferably at bedtime; max. 10 g ointment or 10 mL lotion daily

Note When lotion and ointment used together, max. total tacalcitol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

Curatoderm® (Almiral) 

Lotion, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 mL = £12.73

Excipients include disodium edetate, propylene glycol

Ointment, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 g = £13.40, 60 g = £23.14, 100 g = £30.86

Excipients none as listed in section 13.1.3

Tazarotene

TAZAROTENE

Indications mild to moderate plaque psoriasis affecting up to 10% of skin area

Cautions wash hands immediately after use, avoid excessive exposure to UV light (including sunlight, solariums, PUVA or UVB treatment); do not apply emollients or cosmetics within 1 hour of application

Pregnancy avoid, effective contraception required (oral progestogen-only contraceptives not considered effective)

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects local irritation (more common with higher concentration and may require discontinuation), pruritus, burning, erythema, desquamation, non-specific rash, contact dermatitis, and worsening of psoriasis; rarely stinging and inflamed, dry or painful skin

Dose

Apply once daily in the evening usually for up to 12 weeks; CHILD under 18 years not recommended

Zorac® (Allergan) 

Gel, tazarotene 0.05%, net price 30 g = £14.09; 0.1%, 30 g = £14.80

Excipients include benzyl alcohol, butylated hydroxyanisole, butylated hydroxytoluene, disodium edetate, polysorbate 40

Tars

Indications psoriasis and occasionally chronic atopic eczema

Cautions application to face and skin flexures; use suitable chemical protection gloves for extemporaneous preparation

Contra-indications not for use in sore, acute, or purulent psoriasis or in presence of infection; avoid eyes, mucosa, genital or rectal areas; broken or inflamed skin

Side-effects skin irritation and acne-like eruptions, photosensitivity; stains skin, hair, and fabric

Dose

Apply 1–3 times daily starting with low-strength preparations

Note For shampoo preparations see section 13.9; for use with dressings see Appendix 8 (section A8.8.9)

Non-proprietary preparations

May be difficult to obtain. Patients may find newer proprietary preparations more acceptable

Calamine and Coal Tar Ointment, BP

Ointment, calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g

Excipients include wool fat

Dose apply 1–2 times daily

Coal Tar and Salicylic Acid Ointment, BP

Ointment, coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polyethylene glycol 600, liquid paraffin 7.8 g

Excipients include cetostearyl alcohol

Dose apply 1–2 times daily

Coal Tar Paste, BP

Paste, strong coal tar solution 7.5%, in compound zinc paste

Dose apply 1–2 times daily

Zinc and Coal Tar Paste, BP

Paste, zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%

Excipients include cetostearyl alcohol

Dose apply 1–2 times daily

Proprietary preparations

Carbo-Dome® (Sandoz)

Cream, coal tar solution 10%, in a water-miscible basis, net price 30 g = £4.77, 100 g = £16.38

Excipients include benzyl alcohol, hydroxybenzoates (parabens)

Dose psoriasis, apply to skin 2–3 times daily

Cocos® (UCB Pharma)

Scalp ointment, coal tar solution 12%, salicylic acid 2%, precipitated sulphur 4%, in a coconut oil emulsion basis, net price 40 g (with applicator nozzle) = £5.98, 100 g = £11.23

Excipients include cetostearyl alcohol

Dose scaly scalp disorders including psoriasis, eczema, seborrheic dermatitis and dandruff, apply to scalp once weekly as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour; CHILD 6–12 years, medical supervision required (not recommended under 6 years)
**Polytar Emollient** *(Stiefel)*

- **Bath additive,** coal tar solution 2.5%, arachis (peanut) oil extract of coal tar 7.5%, paraffin 5%, cera cata 4.5%, liquid paraffin 5%, net price 500 mL = £8.54. **Excipients** include isopropyl palmitate. **Dose** psoriasis, apply to skin or scalp 1–2 times daily. **Scalp liquid**—section 13.9.

**Psoriderm** *(Derma)*

- **Cream,** coal tar 6%, lecithin 0.4%, net price 225 mL = £9.42. **Excipients** include isopropyl palmitate, propylene glycol. **Dose** psoriasis, apply to skin or scalp 1–2 times daily.

**Scalp lotion**—section 13.9.

**Sebco** *(Derma UK)*

- **Scalp ointment,** coal tar solution 12%, salicylic acid 2%, precipitated sulphur 4%, in a coconut oil emollient basis, net price 40 g = £4.54, 100 g = £8.52. **Excipients** include cetostearyl alcohol. **Dose** scalp scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff, apply to scalp as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour; (CHILD) 6–12 years, medical supervision required (not recommended over 6 years).

**Seborpure** *(Derma)*

- **Cream,** coal tar 6%, coal tar solution 4%, precipitated sulphur 4%, net price 100 mL = £7.95, 200 mL = £15.90. **Excipients** include isopropyl palmitate, propylene glycol. **Dose** psoriasis, apply to skin or scalp 1–2 times daily. **Scalp solution**—section 13.9.

**SALICYLIC ACID**

- **Cream,** coal tar 1%, salicylic acid 2%, precipitated sulphur 4%, in a coconut oil emollient basis, net price 40 g = £4.54, 100 g = £8.52. **Excipients** include cetostearyl alcohol. **Dose** scalp scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff, apply to scalp as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour; (CHILD) 6–12 years, medical supervision required (not recommended over 6 years).

conditions (section 13.9); fungal nail infections (section 13.10.2)

Cautions see notes above; avoid broken or inflamed skin

Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin

Side-effects sensitivity, excessive drying, irritation, systemic effects after widespread use (see under Cautions)

Dose
- See preparations

Zinc and Salicylic Acid Paste, BP Paste, (Lassar's Paste), zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%, net price 25 g = 17p

Dose apply twice daily

Oral retinoids for psoriasis

ACITRETIN

Note Acitretin is a metabolite of etretinate

Indications severe extensive psoriasis resistant to other forms of therapy; palmoplantar pustular psoriasis; severe congenital ichthyosis; severe Darier's disease (keratosis follicularis)

Cautions exclude pregnancy before starting (test for pregnancy within 2 weeks before treatment and monthly thereafter; start treatment on day 2 or 3 of menstrual cycle)—women (including those with history of infertility) should avoid pregnancy and use effective contraception for at least 1 month before, during, and for at least 3 years after treatment (oral progesteron-only contraceptives not considered effective); patients should avoid concomitant tetracycline or methotrexate, high doses of vitamin A (more than 4000–5000 units daily), and use of keratolytics, and should not donate blood during or for at least 1 year after stopping therapy (teratogenic risk); check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months; monitor serum-triglyceride and serum-cholesterol concentrations every 2–4 weeks for first 2 months, then every 3 months; diabetes (can alter glucose tolerance—initial frequent blood glucose checks); radiographic assessment on long-term treatment; investigate atypical musculoskeletal symptoms; in children use only in exceptional circumstances (pre-mature epiphyseal closure reported); avoid exposure to sunlight and unsupervised use of sunlamps; interactions: Appendix 1 (retinoids)

Contra-indications hyperlipidaemia

Hepatic impairment avoid—risk of further impairment

Renal impairment avoid; increased risk of toxicity

Pregnancy avoid—teratogenic; effective contraception must be used—see Cautions above

Breast-feeding avoid

Side-effects dryness of mucous membranes (sometimes erosion), of skin (sometimes scaling, thinning, erythema especially of face, and pruritus), and of conjunctiva (sometimes conjunctivitis and decreased tolerance of contact lenses); sticky skin, dermatitis; other side-effects reported include palmoplantar exfoliation, epistaxis, epidermal and nail fragility, peripheral oedema, vulvovaginal candidiasis, paronychia, granulomatous lesions, bullous eruptions, reversible hair thinning and alopecia, myalgia and arthralgia, occasional nausea, headache, malaise, drowsiness, rhinitis, sweating, taste disturbance, stomatitis, cheilitis, and gingivitis; benign intracranial hypertension (discontinue if severe headache, vomiting, diarrhoea, abdominal pain, and visual disturbance occur; avoid concomitant tetracyclines); photosensitivity, corneal ulceration, rarely jaundice and hepatitis (avoid concomitant methotrexate); raised serum-triglyceride or serum-cholesterol concentration; decreased night vision reported; skeletal hyperostosis and extra-osseous calcification reported following long-term administration of etretinate (and premature epiphyseal closure in children, see Cautions above)

Dose
- ADULT over 18 years (under expert supervision), initially 25–30 mg daily (Darier's disease 10 mg daily) for 2–4 weeks, then adjusted according to response, usual range 25–50 mg daily; up to 75 mg daily for short periods in psoriasis and ichthyosis (see p. 716); CHILD under 18 years see BNF for Children

Neotigason® (Actavis) Capsules, acitretin 10 mg (brown/white), net price 60-cap pack = £23.80; 25 mg (brown/yellow), 60-cap pack = £55.24. Label: 10, patient information leaflet, 11, 21

13.5.3 Drugs affecting the immune response

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus by topical application is licensed for mild to moderate atopic eczema. Tacrolimus is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in treating atopic eczema

NICE guidance Tacrolimus and pimecrolimus for atopic eczema (August 2004)

Topical pimecrolimus and tacrolimus are options for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years and topical tacrolimus is recommended for moderate to severe atopic eczema in adults and children over 2 years. Pimecrolimus and tacrolimus should be used within their licensed indications.

For the role of topical corticosteroids in eczema, see section 13.5.1, and for comment on their limited role in psoriasis, see section 13.4. A short course of a systemic corticosteroid (section 6.3.2) can be given for eczema flares that have not improved despite appropriate topical treatment.
Ciclosporin by mouth can be used for severe psoriasis and for severe eczema. Azathioprine or mycophenolate mofetil (section 8.2.1) are used for severe refractory eczema [unlicensed indication]. Hydroxychloroquine (section 8.2.2) is used by mouth for severe psoriasis [unlicensed indication].

Methotrexate can be used for severe psoriasis, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid 5 mg (section 9.1.2) can be given once weekly [unlicensed indication], on a different day from the methotrexate, to reduce the possibility of side-effects associated with methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept, adalimumab, and infliximab inhibit the activity of tumour necrosis factor (TNF-α). They are used for severe plaque psoriasis either refractory to at least 2 standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, adalimumab or infliximab may be useful when rapid disease control is required. Ustekinumab (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for severe plaque psoriasis that has not responded to etanercept, adalimumab, or infliximab, or when these drugs cannot be used because of intolerance or contra-indications (see also NICE guidance below). Adalimumab, etanercept, and infliximab are also licensed for psoriatic arthritis (section 10.1.3).

NICE guidance
Adalimumab for plaque psoriasis in adults
Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks.

NICE guidance
Etanercept and efalizumab for plaque psoriasis in adults
Etanercept is recommended for severe psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Etanercept should be withdrawn if the response is not adequate after 12 weeks. Following suspension of the marketing authorisation for efalizumab, NICE has temporarily withdrawn its guidance on the use of efalizumab for plaque psoriasis.

NICE guidance
Infliximab for plaque psoriasis in adults
Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.

NICE guidance
Ustekinumab for plaque psoriasis in adults
Ustekinumab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Ustekinumab should be withdrawn if the response is not adequate after 16 weeks. For patients weighing over 100 kg, the manufacturer should provide the 90-mg dose of ustekinumab at the same price as the 45-mg dose.

AZATHIOPRINE
Indications
severe refractory eczema [unlicensed indication]; inflammatory bowel disease (section 1.5.3); autoimmune conditions and prophylaxis of transplant rejection (section 8.2.1); rheumatoid arthritis (section 10.1.3)
Cautions
section 8.2.1
Contra-indications
section 8.2.1; also very low or deficient thiopurine methyltransferase (TPMT) activity (homozygous phenotype)
Hepatic impairment
section 8.2.1
Renal impairment
section 8.2.1
Pregnancy
section 8.2.1
Breast-feeding
section 8.2.1
Side-effects
section 8.2.1
Dose
Severe refractory eczema [unlicensed indication], by mouth, normal or high TPMT activity, 1–3 mg/kg daily; low TPMT activity (heterozygous phenotype), 0.5–1 mg/kg daily
Preparations
Section 8.2.1

CICLOSPORIN
(Cyclosporin)
Indications
see under Dose; severe acute ulcerative colitis (section 1.5.3); transplantation and graft-versus-host disease (section 8.2.2)
Cautions
section 8.2.2
Additional cautions in atopic dermatitis and psoriasis
Contra-indicated in abnormal renal function, uncontrolled hypertension (see also below), infections not under control, and malignancy (see also below). Dermatological and physiological examination, including blood pressure and renal function measurements required at least twice before starting. During treatment, monitor serum creatinine every 2

2. The Scottish Medicines Consortium issued similar advice (August 2009) on the use of etanercept in adults and children over 8 years of age
weeks for first 3 months then every month; reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within 1 month. Discontinue if hypertension develops that cannot be controlled by dose reduction or antihypertensive therapy. Avoid excessive exposure to sunlight and avoid use of UVB or PUVA. In atopic dermatitis, also allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe). Staphylococcus aureus skin infections not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative—see also interactions: Appendix 1 (ciclosporin)); investigate lymphaedenopathy that persists despite improvement in atopic dermatitis. In psoriasis, also exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.

**Hepatic impairment** section 8.2.2

**Renal impairment** see Cautions above

**Pregnancy** see Immunosuppressant therapy, p. 553

**Breast-feeding** section 8.2.2

**Side-effects** section 8.2.2

**Dose**
- Short-term treatment (usually for max. 8 weeks but can be longer under specialist supervision) of severe atopic dermatitis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, by mouth, ADULT and CHILD over 16 years, initially 2.5 mg/kg daily in 2 divided doses, if good initial response not achieved within 2 weeks, increase rapidly to max. 5 mg/kg daily; initial dose of 5 mg/kg daily in 2 divided doses if very severe; CHILD under 16 years see BNF for Children
- Severe psoriasis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, by mouth, ADULT and CHILD over 16 years, initially 2.5 mg/kg daily in 2 divided doses, increased gradually to max. 5 mg/kg daily if no improvement within 1 month (discontinue if response still insufficient after 6 weeks); initial dose of 5 mg/kg daily justified if rapid control required; CHILD under 16 years see BNF for Children

**Important**

For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

## METHOTREXATE

**Indications** severe psoriasis unresponsive to conventional therapy (specialist use only); Crohn’s disease (section 1.5.3); malignant disease (section 8.1.3); rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3; also photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported)

**Contra-indications** section 10.1.3

**Hepatic impairment** avoid—dose-related toxicity

**Renal impairment** section 10.1.3

**Pregnancy** section 10.1.3

**Breast-feeding** section 10.1.3

**Side-effects** section 10.1.3

**Dose**
- By mouth or by intramuscular or intravenous or subcutaneous injection, 2.5–10 mg once weekly; increased according to response in steps of 2.5–5 mg at intervals of at least 1 week; usual dose 7.5–15 mg once weekly; max. weekly dose 30 mg; **ELDERLY** consider dose reduction (extreme caution); **CHILD** 2–18 years see BNF for Children

### Important

Note that the above dose is a weekly dose. To avoid error with low dose methotrexate, it is recommended that:
- the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers); liver toxicity (e.g. nausea, vomiting, except emollients at treatment site; alcohol consumption (risk of facial flushing and skin irritation)

### Contra-indications

contact with eyes and mucous membranes, application under occlusion, infection at treatment site; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions

**Side-effects** burning sensation, pruritus, erythema, skin infections (including folliculitis and less commonly impetigo, herpes simplex and zoster, molluscum contagiosum); rarely papilloma, skin discoloration, local reactions including pain, paraesthesia, peeling, dryness, oedema, and worsening of eczema; skin malignancy reported

**Dose**
- Short-term treatment, apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks); **CHILD** under 2 years not recommended

**Eldel®** (Novartis) Cream, pimecrolimus 1%, net price 30 g = £19.69, 60 g = £37.41, 100 g = £59.07. Label: 4, 28

**Excipients** include benzyl alcohol, cetyl alcohol, propylene glycol, stearyl alcohol

## PIMECROLIMUS

**Indications** short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used; see also notes above

**Cautions** UV light (avoid excessive exposure to sunlight and sunlamps), avoid other topical treatments except emollients at treatment site; alcohol consumption (risk of facial flushing and skin irritation)

**Contra-indications** contact with eyes and mucous membranes, application under occlusion, infection at treatment site; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions

**Side-effects** burning sensation, pruritus, erythema, skin infections (including folliculitis and less commonly impetigo, herpes simplex and zoster, molluscum contagiosum); rarely papilloma, skin discoloration, local reactions including pain, paraesthesia, peeling, dryness, oedema, and worsening of eczema; skin malignancy reported

**Dose**
- Short-term treatment, apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks); **CHILD** under 2 years not recommended

**Eldel®** (Novartis) Cream, pimecrolimus 1%, net price 30 g = £19.69, 60 g = £37.41, 100 g = £59.07. Label: 4, 28

**Excipients** include benzyl alcohol, cetyl alcohol, propylene glycol, stearyl alcohol

### Preparations

Section 10.1.3

### TACROLIMUS

**Indications** short-term treatment of moderate to severe atopic eczema (including flares) either unresponsive to, or in patients intolerant of conventional therapy; prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus; see also notes above; other indications section 8.2.2

**TACROLIMUS**
Cautions infection at treatment site, UV light (avoid excessive exposure to sunlight and sunlamps); alcohol consumption (risk of facial flushing and skin irritation)

Contra-indications congenital epidermal barrier defects; generalised erythrodema; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions; avoid contact with eyes and mucous membranes; avoid under occlusion

Pregnancy manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration

Breast-feeding manufacturer advises avoid—present in milk following systemic administration

Side-effects application-site reactions including rash, irritation, pain and paraesthesia; herpes simplex infection, Kaposi’s varicelliform eruption; application-site infections; less commonly acne; rosacea and skin malignancy also reported

Dose
- Short-term treatment, ADULT and CHILD over 16 years initially apply 0.1% ointment thinly twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks); reduce to once daily or switch to 0.03% ointment if condition allows; CHILD 2–16 years, initially apply 0.03% ointment thinly twice daily for up to 3 weeks (consider other treatment if eczema worsens or if no improvement after 2 weeks) then reduce to once daily until lesion clears
- Prevention of flares, ADULT and CHILD over 16 years, apply 0.1% ointment thinly twice weekly; use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year; CHILD 2–16 years, apply 0.03% ointment thinly twice weekly; use short-term treatment regimen during an acute flare; interrupt preventative therapy after 1 year to reassess condition

Protopic® (Astellas) Ointment, tacrolimus (as monohydrate) 0.03%, net price 30 g = £19.44, 60 g = £35.46; 0.1%, 30 g = £21.60, 60 g = £39.40. Label: 4, 11, 28

Excipients include beeswax

Cytokine modulators

ADALIMUMAB

Indications see notes above; Crohn’s disease (section 1.5.3); anklyosing spondylitis, polyarticular juvenile idiopathic arthritis, psoriatic arthritis, rheumatoid arthritis (section 10.1.3)

Cautions section 10.1.3

Contra-indications section 10.1.3

Pregnancy section 10.1.3

Breast-feeding section 10.1.3

Side-effects section 10.1.3

Dose
- By subcutaneous injection, plaque psoriasis, ADULT over 18 years, initially 80 mg, then 40 mg on alternate weeks starting 1 week after initial dose; discontinue treatment if no response within 16 weeks

Preparations
Section 10.1.3

ETANERCEPT

Indications see notes above; anklyosing spondylitis, psoriatic arthritis, polyarticular course juvenile idiopathic arthritis, rheumatoid arthritis (section 10.1.3)

Cautions section 10.1.3

Contra-indications section 10.1.3

Hepatic impairment section 10.1.3

Pregnancy section 10.1.3

Breast-feeding section 10.1.3

Side-effects section 10.1.3

Dose
- By subcutaneous injection, plaque psoriasis, 25 mg twice weekly or 50 mg once weekly; max. treatment duration 24 weeks; discontinue if no response after 12 weeks; CHILD 8–18 years, 800 micrograms/kg (max. 50 mg) once weekly; max. treatment duration 24 weeks; discontinue if no response after 12 weeks

Preparations
Section 10.1.3

INFLIXIMAB

Indications see notes above; inflammatory bowel disease (section 1.5.3); anklyosing spondylitis, psoriatic arthritis, rheumatoid arthritis (section 10.1.3)

Cautions section 10.1.3; monitor for non-melanoma skin cancer before and during treatment

Contra-indications section 10.1.3

Pregnancy section 10.1.3

Breast-feeding section 10.1.3

Side-effects section 10.1.3

Dose
- By intravenous infusion, plaque psoriasis, ADULT over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; discontinue if no response within 14 weeks of initial infusion

Preparations
Section 10.1.3

USTEKINUMAB

Indications see notes above

Cautions predisposition to infection; history or development of malignancy; elderly; interactions

Tuberculosis Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

Contra-indications active infection

Pregnancy avoid; manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects infections (sometimes severe); diarrhoea, hypersensitivity reactions (possibly delayed onset),
pain in pharynx and larynx; headache, fatigue, dizziness; depression; arthralgia; myalgia; nasal congestion; pruritus; injection-site reactions

**Dose**

- By subcutaneous injection, plaque psoriasis, ADULT over 18 years, body-weight under 100 kg, initially 45 mg, then 45 mg 4 weeks after initial dose, then 45 mg every 12 weeks; body-weight over 100 kg, initially 45–90 mg, then 45–90 mg 4 weeks after initial dose, then 45–90 mg every 12 weeks

**Note** Discontinue if no response within 16 weeks

Stelara® (Janssen-Cilag) ▼ [inhalation]
**Injection**, ustekinumab 90 mg/mL, net price 0.5–mL (45-mg) prefilled syringe = £2147.00. Label: 10, counselling, tuberculosis

### 13.6 Acne and rosacea

#### 13.6.1 Topical preparations for acne

**Benzoyl peroxide**

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide (see below) or to a topical retinoid (see p. 725). Alternatively, topical application of an antibiotic such as erythromycin or clindamycin may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed (section 13.6.2).

**Benzoyl peroxide and azelaic acid**

**Benzoyl peroxide** is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

**Azelaic acid** has antimicrobial and antimcomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

**Indications** acne vulgaris

**Cautions** avoid contact with eyes, mouth, and mucous membranes; may bleach fabrics and hair; avoid excessive exposure to sunlight

**Side-effects** skin irritation (reduce frequency or suspend use until irritation subsides and re-introduce at reduced frequency)

- **Dose**
  - Apply 1–2 times daily preferably after washing with soap and water, start treatment with lower-strength preparations

**Note** May bleach clothing

**Acnecide®** (Galderma)

- **Gel**, benzoyl peroxide 5% in an aqueous gel basis, net price 60 g = £10.88
  - Excipients include propylene glycol

**Brevoxy®** (Stiefel)

- **Cream**, benzoyl peroxide 4% in an aqueous basis, net price 40 g = £3.30
  - Excipients include cetyl alcohol, fragrance, stearyl alcohol

**PanOxyl®** (Stiefel)

- **Aquageel** (= aqueous gel), benzoyl peroxide 2.5%, net price 40 g = £1.76; 5%, 40 g = £1.92; 10%, 40 g = £2.13
  - Excipients include propylene glycol

- **Cream**, benzoyl peroxide 5% in a non-greasy basis, net price 40 g = £1.89
  - Excipients include isopropyl palmitate, propylene glycol

- **Gel**, benzoyl peroxide 5% in an aqueous alcoholic basis, net price 40 g = £1.51; 10%, 40 g = £1.69
  - Excipients include fragrance

**Wash**, benzoyl peroxide 10% in a detergent basis, net price 150 mL = £4.00
  - Excipients include sodium bicarbonate

**Benzoyl peroxide**

- **Cream**, benzoyl peroxide 5% in a non-greasy basis, net price 40 g = £1.89
  - Excipients include isopropyl palmitate, propylene glycol

**Azelaic acid** has antimicrobial and antimcomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.
Topical antibiotics for acne

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin and clindamycin are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation. Antibacterial resistance of Propionibacterium acnes is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacterium);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

**Indications** clindamycin 1% (as phosphate), in an aqueous alcoholic basis, net price (both with applicator) 30 mL = £4.34, 50 mL = £7.23  
**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide  
**Dose** apply twice daily  

**Lotion, clindamycin 1% (as phosphate)** in an aqueous basis, net price 30 mL = £5.08, 50 mL = £8.47  
**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide  
**Dose** apply twice daily  

**Stieamycin®** (Stiefel)  
**Indications** erythromycin 2% in an alcoholic basis, net price 50 mL = £7.69  
**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide  
**Dose** apply twice daily  

**Zinclacin®** (Crawford)  
**Indications** clindamycin 1% (as phosphate), net price 30 g = £8.66  
**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide  
**Dose** apply once daily  

**Zineryt**  
**Indications** powder for reconstitution, erythromycin 40 mg, zinc acetate 12 mg/mL when reconstituted with solvent containing ethanol, net price per pack of powder and solvent to provide 30 mL = £7.71, 90 mL = £16.68  
**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide  
**Dose** apply twice daily  

**Topical retinoids and related preparations for acne**

Topical tretinoin, its isomer isoretinoin, and adapalene (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Isoretinoin is given by mouth in severe acne; see section 13.6.2 for warnings relating to use by mouth.

**Cautions** topical retinoids should be avoided in severe acne involving large areas. Contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin should be avoided. These drugs should be used with caution in sensitive areas such as the neck, and accumulation in angles of the nose should be avoided. Exposure to UV light (including sunlight, solariums) should be avoided; if sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used. Use of retinoids with abrasive cleaners, comedogenic or astringent cosmetics should be avoided. Exposure to UV light (including sunlight, solariums) should be avoided; if sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used. Use of retinoids with abrasive cleaners, comedogenic or astringent cosmetics should be avoided.
Pregnancy  Topical retinoids are contra-indicated in pregnancy; women of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

Side-effects  Local reactions include burning, erythema, stinging, pruritus, dry or peeling skin (discontinue if severe). Increased sensitivity to UVB light or sunlight occurs. Temporary changes of skin pigmentation with severe). Increased sensitivity to UVB light or sunlight has been reported. Eye irritation and oedema, discomfort (oral). Decrease in breast milk production (breast-feeding women). Contra-indications  Personal or familial history of non-melanoma skin cancer; rosacea; perioral dermatitis; pregnancy; women of child-bearing age.

Indications  For treating acne vulgaris (see notes above; oral treatment (see section 8.1.5).

Cautions  See notes above. Breast-feeding  Amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas.

Dose  ADULT and CHILD over 12 years, apply thinly once daily before retiring to bed; reduce frequency or suspend treatment if irritation occurs.

With antibacterial  Isotrexin® (Stiefel) Gel, isotretinoin 0.05%, erythromycin 2% in ethanolic basis, net price 30 g = £7.47. Label: 11

Excipients  Include butylated hydroxytoluene.

Retin-A® (Janssen-Cilag) Gel, tretinoin 0.01%, net price 60 g = £5.28; 0.025%, 60 g = £5.28. Label: 11

Excipients  Include butylated hydroxytoluene.

Dose  Acne vulgaris, apply thinly 1–2 times daily.

With antibacterial  Aknemycin® Plus (Almirall) Solution, tretinoin 0.025%, erythromycin 4% in an alcoholic basis, net price 25 mL = £7.05. Label: 11

Excipients  None as listed in section 13.1.3

Dose  Acne, apply thinly 1–2 times daily.

Other topical preparations for acne

Salicylic acid  is available in various preparations for sale direct to the public for the treatment of mild acne. Other products are more suitable for acne; salicylic acid is used mainly for its keratolytic effect.

Preparations containing abrasive agents are not considered beneficial in acne.

A topical preparation of nicotinamide is available for inflammatory acne.

Abrasive agents  Note  Isotretinoin is an isomer of tretinoin. Important: For prescribing information on isotretinoin when given by mouth, see p. 728.

Indications  Acne vulgaris (but see notes above).

Cautions  Avoid contact with eyes; discontinue use temporarily if skin becomes irritated.

Contra-indications  Superficial venules, telangiectasia.

Brasivol® (Stiefel) Paste No. 1, aluminium oxide 38.09% in fine particles, in a soap-detergent basis, net price 75 g = £2.21

Excipients  Include fragrance, N-(3-Chloroallyl)hexamminium chloride (quaternium 15)

Dose  Use instead of soap 1–3 times daily.

Nicotinamide  Indications  See under preparation.

Cautions  Avoid contact with eyes and mucous membranes (including nose and mouth); reduce frequency of application if excessive dryness, irritation or peeling.
Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is no more effective than an oral broad-spectrum antibacterial but is useful in women who also wish to receive oral contraception. Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent. Contra-indications of co-cyprindiol include pregnancy and a predisposition to thrombosis.

Venous thromboembolism occurs more frequently in women taking co-cyprindiol than in those taking a low-dose combined oral contraceptive. Co-cyprindiol is licensed for use in women with severe acne that has not responded to oral antibacterials and for moderately severe hirsutism; it should not be used solely for contraception. It is contra-indicated in those with a personal or close family history of venous thromboembolism. Women with severe acne or hirsutism may have an inherently increased risk of cardiovascular disease.

13.6.2 Oral preparations for acne

Oral antibacterials for acne

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomedonal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either oxytetracycline or tetracycline (section 5.1.3) is usually given for acne in a dose of 500 mg twice daily. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline and lymecycline (section 5.1.3) are alternatives to tetracycline. Doxycycline can be used in a dose of 100 mg daily. Lymecycline is given in a dose of 408 mg daily.

Although minocycline is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a dose of 100 mg once daily or 50 mg twice daily.

Erythromycin (section 5.1.5) in a dose of 500 mg twice daily is an alternative for the management of acne but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim (section 5.1.8) in a dose of 300 mg twice daily may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.
Oral retinoid for acne

The retinoid isotretinoin reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin, nose bleeds, and joint pains. The drug is teratogenic and must not be given to women of child-bearing age unless they practise effective contraception (oral progesterone-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme (see under Cautions below).

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

Note Isotretinoin is an isomer of tretinoin

**Indications** see notes above

**Cautions** see notes above; also avoid blood donation during treatment and for at least 1 month after treatment; history of depression; monitor all patients for depression; measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised); discontinue if uncontrolled hypertriglyceridaemia or pancreatitis; diabetes; dry eye syndrome (associated with risk of keratitis); avoid keratoconjunctivitis; **Interactions:** Appendix 1 (retinoids)

**Pregnancy prevention** In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practice effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progesterone-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

**Counselling** Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.
13.7 Preparations for warts and calluses

Warts (verrucas) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region (see below); treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid, formaldehyde, glutaraldehyde or silver nitrate are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation. An ointment combining salicylic acid with podophyllum resin (Posalfilin®) is available for treating plantar warts; severe systemic toxicity including gastrointestinal, renal haematological, and CNS effects may occur with excessive application of preparations containing podophyllum. Cryotherapy causes pain, swelling, and blistering and may be no more effective than topical salicylic acid in the treatment of warts.

**SALICYLIC ACID**

**Indications** see under preparations; psoriasis (section 13.9.2); acne (section 13.6.1); fungal nail infections (section 13.10.2)

**Cautions** significant peripheral neuropathy, patients with diabetes at risk of neuropathic ulcers; protect surrounding skin and avoid broken skin; not suitable for application to face, anogenital region, or large areas

**Side-effects** skin irritation, see notes above

**Dose** • See under preparations; advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly; treatment may need to be continued for up to 3 months

**Cuplex®** (Crawford)

**Gel**, salicylic acid 11%, lactic acid 4%, in a collodion basis, net price 5 g = £2.23. Label: 15

**Dose** for plantar and mosaic warts, apply twice daily

**Note** Contains colophony (see notes above)

**Duofilm®** (Stiefel)

**Paint**, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 15 mL (with applicator) = £2.25. Label: 15

**Dose** for plantar and mosaic warts, apply daily

**Occlusal®** (Alliance)

**Cutaneous solution**, salicylic acid 26% in polyacrylic solution, net price 10 mL (with applicator) = £3.56.

**Label**: 15

**Dose** for common and plantar warts, apply daily

**Salactol®** (Dermal)

**Paint**, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 10 mL (with applicator) = £1.71. Label: 15

**Dose** for warts, particularly plantar warts, verrucas, corns, and calluses, apply daily

**Note** Contains colophony (see notes above)

**Salatac®** (Dermal)

**Gel**, salicylic acid 12%, lactic acid 4% in a collodion basis, net price 8 g (with applicator) = £2.98. Label: 15

**Dose** for warts, verrucas, corns, and calluses, apply daily

**Verrugon®** (Ransom)

**Ointment**, salicylic acid 50% in a paraffin basis, net price 6 g = £3.12

**Dose** for plantar warts, apply daily

- With podophyllum

**Posalfilin®** (Norgine)

**Ointment**, podophyllum resin 20%, salicylic acid 25%, net price 10 g = £3.37

**Pregnancy** avoid—neonatal death and teratogenesis have been reported with podophyllum

**Breast-feeding** avoid

**Dose** for plantar warts apply daily

**Note** Owing to the salicylic acid content, not suitable for anogenital warts; owing to the podophyllum content, also contra-indicated in pregnancy and breast-feeding

**FORMALDEHYDE**

**Indications** see under preparations

**Cautions** see under Salicylic Acid

**Side-effects** see under Salicylic Acid

**Veracur®** (Typharm)

**Gel**, formaldehyde 0.75% in a water-miscible gel basis, net price 15 g = £2.41.

**Dose** for warts, particularly plantar warts, apply twice daily

**GLUTARALDEHYDE**

**Indications** warts, particularly plantar warts

**Cautions** protect surrounding skin; not for application to face, mucosa, or anogenital areas

**Side-effects** rashes, skin irritation (discontinue if severe); stains skin brown

**Dose** • Apply twice daily (see also under Salicylic acid)

**Glutarol®** (Dermal)

**Solution** (= application), glutaraldehyde 10%, net price 10 mL (with applicator) = £2.07

**SILVER NITRATE**

**Indications** warts, verrucas, umbilical granulomas, over-granulating tissue, cauterisation

**Cautions** protect surrounding skin and avoid broken skin; not suitable for application to face, ano-genital region, or large areas

**Side-effects** chemical burns on surrounding skin; stains skin and fabric

**Dose** • Common warts and verrucas, apply moistened caustic pencil tip for 1–2 minutes; repeat after 24 hours up to max. 3 applications for warts or max. 6 applications for verrucas

**Note** Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

- Umbilical granulomas, apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes while protecting surrounding skin with soft paraffin

**Silver nitrate** (Non-proprietary)

**Caustic pencil**, tip containing silver nitrate 40%, potassium nitrate 60%, net price = 93p
Skin

13.8 Sunscreens and camouflagers

AVOCA® (Bray)

Caustic pencil, tip containing silver nitrate 95%, potassium nitrate 5%, net price, treatment pack (including emery file, 6 adhesive dressings and protector pads) = £1.94.

Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. **Podophyllotoxin** (the major active ingredient of podophyllum) may be used for soft, non-keratinised external anogenital warts. Patients with a limited number of external warts or keratinised lesions may be better treated with cryotherapy or other forms of physical ablation.

**Imiquimod** cream is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis (section 13.8.1). Iminosine pranobex (section 5.3.2.1) is licensed for adjunc-tive treatment of genital warts but it has been superseded by more effective drugs.

**IMIQUIMOD**

**Indications** see under Dose

**Cautions** avoid normal or broken skin, and open wounds; not suitable for internal genital warts; uncircumcised males (risk of phimosis or stricture of foreskin), autoimmune disease; immunosuppressed patients

**Pregnancy** no evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution

**Breast-feeding** no information available

**Side-effects** local reactions (including itching, burning sensation, erythema, erosion, oedema, excoriation, and scabbing); headache; influenza-like symptoms; myalgia; less commonly local ulceration and alopecia, rarely Stevens-Johnson syndrome and cutaneous lupus erythematosus-like effect; very rarely dysuria in women; permanent hypopigmentation or hyperpigmentation reported

**Dose**

- Warts (external genital and perianal), apply thinly 3 times a week at night until lesions resolve (max. 16 weeks)
- Superficial basal cell carcinoma, apply to lesion (and 1 cm beyond it) on 5 days each week for 6 weeks; assess response 12 weeks after completing treatment
- Actinic keratosis, apply to lesion 3 times a week for 4 weeks; assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist; max. 2 courses
- **CHILD under 18 years see BNF for Children**

**Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact

**Aldara®** (Meda) (Stiefel)

Cream, imiquimod 5%, net price 12-sachet pack = £48.34. Label: 10, patient information leaflet

**Excipients** include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polysorbate 60, stearyl alcohol

**Contra-indications** may damage latex condoms and diaphragms

13.8 Sunscreens and camouflagers

**13.8.1 Sunscreen preparations**

**13.8.2 Camouflagers**

Podophyllotoxin

**Indications** see under preparations

**Cautions** avoid normal skin and open wounds; keep away from face; very irritant to eyes

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** local irritation

**Condyline®** (Nycomed)

**Solution**, podophyllotoxin 0.5% in alcoholic basis, net price 3.5 mL (with applicators) = £14.49. Label: 15

**Dose** condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm² in the male. max. 50 single applications (‘loops’) per session (consult product literature). **CHILD 2–18 years see BNF for Children**

**Warticon®** (Stiefel)

**Cream**, podophyllotoxin 0.15%, net price 5 g (with mirror) = £14.86

**Excipients** include butylated hydroxyanisole, cetyl alcohol, hydroxybenzoates (parabens), sorbic acid, stearyl alcohol

**Dose** condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm²; **CHILD 2–18 years see BNF for Children**

**Solution**, blue, podophyllotoxin 0.5% in alcoholic basis, net price 3 mL (with applicators) = £12.38. Label: 15

**Dose** condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm²; max. 50 single applications (‘loops’) per session (consult product literature). **CHILD 2–18 years see BNF for Children**

13.8 Sunscreens and camouflagers

**13.8.1 Sunscreen preparations**

**13.8.2 Camouflagers**

Sunscreens and camouflagers

**13.8.1 Sunscreen preparations**

**Sunscreens**

Sunscreens are absorbed by the skin to protect it from ultraviolet radiation. They are more effective if used in combination with protective clothing and shade. They are not effective if worn under clothing or if not applied correctly. They may also reduce the effectiveness of condoms and diaphragms.

**Sunscreens**

Solar ultraviolet radiation can be harmful to the skin. It is responsible for disorders such as **polymorphic light eruption**, **solar urticaria**, and it provokes the various **cutaneous porphyrias**. It also provokes (or at least aggravates) skin lesions of **lupus erythematosus** and may aggravate **rosacea** and some other **dermatoses**. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as **sunburn**) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include **aging changes** and more importantly the initiation of **skin cancer**.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause sunburn. The long wavelengths (320–400 nm, known as UVA) are responsible for many
photosensitivity reactions and photodermatoses. Both UVA and UVB contribute to long-term photodamage and to the changes responsible for skin cancer and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied thickly and frequently (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF

## Borderline substances

The preparations marked 'ACBS' are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed. See also Appendix 7.

### Delphin® (Fenton)

**Lotion**, (UVA and UVB protection; UVB-SPF 30), oxybenzone 4.8%, oxybenzone 1.5%, titanium dioxide 2%, net price 200 mL = £3.57. ACBS

**Excipients** include cetostearyl alcohol, fragrance, hydroxystearates (parabens), niacinamide.

**Note** For INCI synonyms, see table above

### Sunsense® Ultra (Crawford)

**Lotion** (UVA and UVB protection; UVB-SPF 50+), octinoxate 6%, enzacamene 4%, avobenzone 2%, oxybenzone 2%, ensulizole 2%, titanium dioxide 3%, net price 50-mL bottle with roll-on applicator = £4.11, 125 mL = £6.86, 500 mL = £15.54. ACBS

**Excipients** include butylated hydroxytoluene, cetyl alcohol, fragrance, hydroxystearates (parabens), propylene glycol.

**Note** For INCI synonyms, see table above

### Uvistat® (LPC)

**Cream** (UVA and UVB protection; UVB-SPF 30), avobenzone 5%, bisoctrizole 1.5%, octinoxate 7.5%, octocrylene 4%, titanium dioxide 5.2%, net price 125 mL = £7.45. ACBS

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol.

**Note** For INCI synonyms, see table above

**Cream** (UVA and UVB protection; UVB-SPF 50), amiloxate 2%, avobenzone 5%, bisoctrizole 6%, octinoxate 10%, octocrylene 4%, titanium dioxide 4.8%, net price 125 mL = £8.45. ACBS

**Excipients** include disodium edetate, polyisobutyl 60, propylene glycol.

**Note** For INCI synonyms, see table above

**Cream** (UVA and UVB protection; UVB-SPF 50), avobenzone 5%, bemotrizinol 3%, octinoxate 10%, octocrylene 4%, titanium dioxide 3%, net price 5 g = £2.99. ACBS

**Excipients** include butylated hydroxytoluene, hydroxystearates (parabens).

**Note** For INCI synonyms, see table above

### Photodamage

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments are used for non-hypertrophic actinic keratosis. An emollient may be sufficient for mild lesions. **Diclofenac** gel is suitable for the treatment of superficial lesions in mild disease. **Fluorouracil** cream is effective against most types of non-hypertrophic actinic keratosis. **Imiquimod** (section 13.7) is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac but lesions resolve faster. **Photodynamic therapy** in combination with methyl-5-aminolevulinate cream (**Metvix**, available from Galderma) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratoses when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for peri-orbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

### DICLOFENAC SODIUM

#### Indications

**Actinic keratosis**

**Cautions** as for topical NSAIDs, see section 10.3.2
Contra-indications as for topical NSAIDs, see section 10.3.2
Side-effects as for topical NSAIDs, see section 10.3.2; also paraesthesia; application of large amounts may result in systemic effects, see section 10.1

Dose
- Apply thinly twice daily for 60–90 days; max. 8 g daily

Solaraze® (Almirall) (HF)
Gel, diclofenac sodium 3% in a sodium hyaluronate basis, net price 50 g = £38.30, 100 g = £76.60
Exipients include benzyl alcohol

FLUOROURACIL

Indications superficial malignant and pre-malignant skin lesions; other malignant disease (section 8.1.3)
Cautions avoid contact with mucous membranes; caution in handling—irritant to tissues
Pregnancy manufacturer advises avoid (teratogenic)
Breast-feeding manufacturer advises avoid
Side-effects local irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions), photosensitivity, erythema multiforme

Dose
- Apply thinly to the affected area once or twice daily; max. area of skin treated at one time, 500 cm² (e.g. 23 cm × 23 cm); usual duration of initial therapy, 3–4 weeks
Note Alternative regimens may be in use in some settings

Efudix® (Meda) (HF)

Cream, fluorouracil 5%, net price 40 g = £32.73
Exipients include hydroxybenzoates (parabens), polyethylene glycol, stearyl alcohol

13.8.2 Camouflagers

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Borderline substances The preparations marked ACBS are regarded as drugs when prescribed for postoperative scars and other deformities and as an adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo. See also Appendix 7.

Covermark® (Skin Camouflage Co.)

Classic foundation, net price 15 mL (10 shades) = £11.32, ACBS
Exipients include beeswax, hydroxybenzoates (parabens), fragrance
Finishing powder, net price 25 g = £11.32, ACBS
Exipients include beeswax, hydroxybenzoates (parabens), fragrance

Dermacolor® (Fox)

Camouflage cream, (100 shades), net price 25 mL = £9.96
ACBS
Exipients include beeswax, butylhydroxytoluene, fragrance, propylene glycol, stearyl alcohol, wool fat
Fixing powder, (7 shades), net price 60 g = £8.45. ACBS
Exipients include fragrance

Keromask® (Lornamade)

Masking cream, (9 shades), net price 15 mL = £5.68. ACBS
Exipients include butylated hydroxyanisole, hydroxybenzoates (parabens), wool fat, propylene glycol

13.9 Shampoos and other preparations for scalp and hair conditions

Dandruff is considered to be a mild form of seborrhoeic dermatitis (see also section 13.5.1). Shampoos containing antimicrobial agents such as pyrithione zinc (which are widely available) and selenium sulphide may have beneficial effects. Shampoos containing tar extracts may be useful and they are also used in psoriasis.

Ketocanazole shampoo should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Cortico-steroid gels and lotions (section 13.4) can also be used.

Shampoos containing coal tar and salicylic acid may also be useful. A cream or an ointment containing coal tar and salicylic acid is very helpful in psoriasis that affects the scalp (section 13.5.2). Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

Crade cap in infants may be treated with coconut oil or olive oil applications followed by shampooing.

See below for male-pattern baldness and also section 13.5 (psoriasis and eczema), section 13.10.4 (lice), and section 13.10.2 (ringworm).

Shampoos

Ketocanazole (Non-proprietary) (HF)

Cream—section 13.10.2
Shampoo, ketocanazole 2%, net price 120 mL = £3.53
Exipients include imidurea
Brands include Dandrazol® 2% Shampoo, Nitrazol®
Dose treatment of seborrhoeic dermatitis and dandruff apply twice weekly for 2–4 weeks (prophylaxis apply once every 1–2 weeks); treatment of pityriasis versicolor apply once daily for max. 5 days (prophylaxis apply once daily for up to 3 days before sun exposure); leave preparation on for 3–5 minutes before rinsing
1. Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketocanazole max. 2%, in a pack containing max. 120 mL and labelled to show a maximum frequency of application of once every 3 days

Alphosyl 2 in 1® (GSK Consumer Healthcare)

Shampoo, alcoholic coal tar extract 5%, net price 125 mL = £1.81, 250 mL = £3.43
Exipients include hydroxybenzoates (parabens), fragrance
Dose dandruff, use once or twice weekly as necessary; psoriasis, seborrhoeic dermatitis, scaling and itching, use every 2–3 days

Capasal® (Dermal)

Shampoo, coal tar 1%, coconut oil 1%, salicylic acid 0.5%, net price 250 mL = £4.69
Exipients none as listed in section 13.13
Dose scalp scaly disorders including psoriasis, seborrhoeic dermatitis, dandruff, and cradle cap, apply daily as necessary

Veil® (Thomas Blake)

Cover cream, (40 shades), net price 19 g = £20.63, 44 g = £30.68, 70 g = £38.74. ACBS
Exipients include hydroxybenzoates (parabens), wool fat derivative

Finishing powder, translucent, net price 35 g = £22.62. ACBS
Exipients include butylated hydroxyanisole, hydroxybenzoates (parabens)
Hirsutism

Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil, corticosteroids, anabolic steroids, androgens, danazol, and progestogens.

Weight loss can reduce hirsutism in obese women. Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Efllornithine, an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical efllornithine can be used as an adjunct to laser therapy for facial hirsutism in women. Efllornithine should be discontinued in the absence of improvement after treatment for 4 months.

Cyprindiol (section 13.6.2) may be effective for moderately severe hirsutism. Metformin (section 6.1.2.2) is an alternative in women with polycystic ovary syndrome (unlicensed indication). Systemic treatment is required for 6–12 months before benefit is seen.

### Other scalp preparations

#### Cocos®

Section 13.5.2

#### Etrivex®

Section 13.4

#### Polytar® (Stiefel)

**Liquid**, arachis (peanut) oil extract of coal tar 0.3%, cade oil 0.3%, coal tar solution 0.1%, oleyl alcohol 1%, tar 0.3%, net price 250 mL = £2.23

- **Excipients** include fragrance, immurea, polyethylene 80
- **Dose** scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff, apply 2–3 times weekly

#### Polytar Plus® (Stiefel)

**Liquid**, ingredients as Polytar® liquid with hydrolysed animal protein 5%, net price 500 mL = £3.91

- **Excipients** include fragrance, immurea, polyethylene 80
- **Dose** scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff, apply 1–2 times weekly

### Androgenetic alopecia

Finasteride is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

### Efllornithine

#### Indications

- see notes above

#### Pregnancy

- toxicity in animal studies—manufacturer advises avoid

#### Breast-feeding

- manufacturer advises avoid—no information available

#### Side-effects

- acne, application site reactions including burning and stinging sensation, rash; less commonly abnormal hair texture and growth

#### Dose

- Apply thinly twice daily; **CHILD** under 12 years not recommended

- **Note** Preparation must be rubbed in thoroughly; cosmetics may be applied over treated area 5 minutes after efllornithine; do not wash treated area for 4 hours after application

#### Vaniqa® (Almirall)

**Cream**, efllornithine (as hydrochloride) 11.5%, net price 60 g = £52.08

- **Excipients** include cetostearyl alcohol, hydroxybenzoates, stearyl alcohol

- **Note** The Scottish Medicines Consortium has advised (September 2005) that efllornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used

### Androgenetic alopecia

Finasteride is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

### Finasteride

#### Indications

- androgenetic alopecia in men; benign prostatic hyperplasia (section 6.4.2)

#### Cautions

- section 6.4.2

#### Side-effects

- section 6.4.2

#### Dose

- **By mouth** 1 mg daily

#### Proppecia® (MSD)

- **Tablets**, f/c, beige, finasteride 1 mg, net price 28-tab pack = £26.99, 84-tab pack = £81.55
Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1). Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelothrix*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial (see Table 1, section 5.1).

In the community, acute impetigo on small areas of the skin may be treated by short-term topical application of fusidic acid; mupirocin should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as *flucoxacinil* (or *clarithromycin* in penicillin-allergy) (Table 1, section 5.1) should be used. Mild antiseptics (section 13.11) can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected. Topical antibacterials should be avoided on leg ulcers unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin. *If large areas of skin are being treated*, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

*Mupirocin* is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone-iodine, chlorhexidine, or alcohol can be used; their use should be discussed with the local microbiologist.

*Retapamulin* can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA. The Scottish Medicines Consortium (p. 4) has advised (March 2008) that retapamulin (*Altargan*) is not recommended for use within NHS Scotland for the treatment of superficial skin infections. *Silver sulfadiazine* is used in the treatment of infected burns.
13.10.1 Antibacterial preparations

Altargo® (GSK) ▼ (TA)

Ointment, retapamulin 1%, net price 5 g = £7.89.
Label: 28
Excipients include butylated hydroxytoluene

Silver sulfadiazine (Silver sulphadiazine)

Indications prophylaxis and treatment of infection in burn wounds; as an adjunct to short-term treatment of infection in leg ulcers and pressure sores; as an adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions; for conservative management of finger-tip injuries

Cautions G6PD deficiency; may inactivate enzymatic debriding agents—concomitant use may be inappropriate; for large amounts see also interactions: Appendix 1 (sulfonamides)

Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides (see section 5.1.8) if large areas of skin are treated. Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop—but leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days. Argyria may also occur if large areas of skin are treated (or if application is prolonged).

Contra-indications sensitivity to sulfonamides; not recommended for neonates

Hepatic impairment manufacturer advises caution if significant impairment; see also Large Areas, above

Renal impairment manufacturer advises caution if significant impairment; see also Large Areas, above

Pregnancy risk of neonatal haemolysis and methaemoglobinemia in third trimester

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

Side-effects allergic reactions including burning, itching and rashes; argyria reported following prolonged use; leucopenia reported (monitor blood levels)

Flamazine® (S&N Hlth.) (TA)

Cream, silver sulfadiazine 1%, net price 20 g = £2.91, 50 g = £3.85, 250 g = £10.32, 500 g = £18.27
Excipients include cetyl alcohol, polysorbates, propylene glycol
Dose burns, apply daily or more frequently if very exudative; leg ulcers or pressure sores, apply daily or on alternate days (not recommended if ulcer very exudative); finger-tip injuries, apply every 2–3 days, consult product literature for details
Note Apply with sterile applicator

13.10.1.2 Antibacterial preparations also used systemically

Sodium fusidate is a narrow-spectrum antibacterial used for staphylococcal infections. For the role of sodium fusidate in the treatment of impetigo see p. 794.

Metronidazole is used topically for rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole (section 5.1.11) is used to treat wounds infected with anaerobic bacteria.

Angular chelitis An ointment containing sodium fusidate is used in the fissures of angular chelitis when associated with staphylococcal infection. For further information on angular chelitis, see section 13.2.3.
**13.10.2 Antifungal preparations**

**FUSIDIC ACID**

**Indications**  staphylococcal skin infections; penicillin-resistant staphylococcal infections (section 5.1.7); staphylococcal eye infections (section 11.3.1)

**Cautions**  see notes above; avoid contact with eyes

**Side-effects**  rarely hypersensitivity reactions

**Dose**  
- Apply 3–4 times daily

**Fucidin** (LEO)  
- Cream, fusidic acid 2%, net price 15 g = £1.92, 30 g = £3.64
  - Excipients include butylated hydroxyanisole, cetyl alcohol
- Ointment, sodium fusidate 2%, net price 15 g = £2.23, 30 g = £3.79
  - Excipients include cetyl alcohol, wool fat

**Dental prescribing on NHS**  May be prescribed as Sodium Fusidate ointment

**METRONIDAZOLE**

**Indications**  see preparations; rosacea (see also section 13.6); *Helicobacter pylori* eradication (section 1.3); anaerobic infections (section 5.1.11 and section 7.2.2); protozoal infections (section 5.4.2)

**Cautions**  avoid exposure to strong sunlight or UV light

**Side-effects**  skin irritation

**Dose**  
- See preparations

**Acea** (Ferndale)  
- Gel, metronidazole 0.75%, net price 40 g = £9.95
  - Excipients include disodium edetate, hydroxybenzoates (parabens)
- Cream, metronidazole 0.75%, net price 30 g = £12.00
  - Excipients include benzyl alcohol, disodium edetate, hydroxybenzoates (parabens), propylene glycol

**Anabact** (CHS)  
- Gel, metronidazole 0.75%, net price 15 g = £4.47, 30 g = £7.89
  - Excipients include hydroxybenzoates (parabens), propylene glycol
- Cream, metronidazole 0.75%, net price 40 g = £6.86
  - Excipients include hydroxybenzoates (parabens), propylene glycol

**Dose**  
- Acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8 weeks
- Malodorous fungating tumours, apply to clean wound 1–2 times daily and cover with non-adenherent dressing

**Metrogel** (Galderma)  
- Gel, metronidazole 0.75%, net price 40 g = £6.86
  - Excipients include hydroxybenzoates (parabens), propylene glycol
- Gel, metronidazole 0.8%, net price 15 g = £4.59
  - Excipients none as listed in section 13.1.3

**Dose**  
- Acute inflammatory exacerbation of rosacea, apply thinly twice daily for up to 8 weeks
- Malodorous fungating tumours, apply to clean wound 1–2 times daily and cover with non-adenherent dressing

**Metrosa** (Linderma)  
- Gel, metronidazole 0.75%, net price 40 g = £19.90
  - Excipients include propylene glycol
- Gel, metronidazole 0.8%, net price 15 g = £3.64
  - Excipients include disodium edetate, hydroxybenzoates (parabens)

**Dose**  
- Acute inflammatory papules, pustules and erythema of rosacea, apply twice daily for 3–4 months

**Metrotop** (Malynlycke)  
- Gel, metronidazole 0.8%, net price 15 g = £4.59
  - Excipients none as listed in section 13.1.3
- Cream, metronidazole 0.75%, net price 30 g = £7.50
  - Excipients include propylene glycol

**Dose**  
- Acne inflammatory papules and pustules of rosacea, apply twice daily for 8–9 weeks

**Rosiced** (Fabre)  
- Cream, metronidazole 0.75%, net price 40 g = £6.86
  - Excipients include benzyl alcohol, isopropyl palmitate

**Zyomet** (Goldshield)  
- Gel, metronidazole 0.75%, net price 30 g = £12.00
  - Excipients include benzyl alcohol, disodium edetate, propylene glycol

**Dose**  
- Acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8–9 weeks

**13.10.2 Antifungal preparations**

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy (section 5.2) is necessary for nail or scalp infection or if the skin infection is widespread, disseminated, or intractable. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

**Dermatophytoposes**  Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete’s foot), or nail (tinea unguium). Scalp infection requires systemic treatment (section 5.2); additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos, section 13.9). The imidazole antifungals clotrimazole, econazole, ketoconazole, and miconazole are all effective. Terbinaine cream is also effective but it is more expensive. Other topical antifungals include griseofulvin and the undercoenoates. Compound benzoic acid ointment (Whitfield’s ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete’s foot containing tolnaftate are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal (section 5.2) is more effective than topical therapy. However, topical application of amorolfine or toconazole may be useful for treating early onychomycosis when involvement is limited to mild distal disease in up to 2 nails, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

**Pityriasis versicolor**  Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo (section 13.9). Alternatively, selenium sulphide shampoo [unlicensed indication] (section 13.9) can be used as a lotion (diluting with water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.
Topical imidazole antifungals clotrimazole, econazole, ketoconazole, and miconazole, and topical terbinafine are alternatives, but large quantities may be required. If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal (section 5.2). Relapse is common, especially in the immunocompromised.

**Candidiasis** Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole, ketoconazole, or miconazole; topical terbinafine is an alternative. Topical application of nystatin is also effective for candidiasis but it is ineffective against dermatophytes. Refractory candidiasis requires systemic treatment (section 5.2) generally with a triazole such as fluconazole; systemic treatment with terbinafine is not appropriate for refractory candidiasis.

**Angular cheilitis** Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*. For further information on angular cheilitis, see p. 695.

**Compound topical preparations** Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1%) (section 13.4) may be of value in the treatment of intertrigo of a mild corticosteroid with either an imidazole or an econazole antifungal, such as clotrimazole, econazole, ketoconazole, or miconazole; topical terbinafine is an alternative. But these preparations are not appropriate for refractory candidiasis.

**Side-effects** Occasional local irritation and hyper-sensitivity reactions include mild burning sensation, erythema, and itching. Treatment should be discontinued if these are severe.

---

**AMOROLFINE**

**Indications** fungal nail infections

**Cautions** see notes above; also avoid contact with ears

**Pregnancy** systemic absorption very low, but manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above

**Dose**

- Apply to infected nails 1–2 times weekly after filing and cleaning; allow to dry (approx. 3 minutes); treat finger nails for 6 months, toe nails for 9–12 months (review at intervals of 3 months); avoid nail varnish or artificial nails during treatment

**Loceryl®** (Galderma) [SH]

- Nail lacquer, amorolfin (as hydrochloride) 5%, net price 5-mL pack (with nail files, spatulas, and cleansing swabs) = £18.17. Label: 10, patient information leaflet

**Excipients** none as listed in section 13.1.3

---

**BENZOIC ACID**

**Indications** ringworm (tinea), but see notes above

**Benzoic Acid Ointment, Compound, BP** *(Whitfield’s ointment)*

**Ointment**, benzoic acid 6%, salicylic acid 3%, in emulsifying ointment

**Excipients** include ceteostearly alcohol

**Dose** apply twice daily

---

**CLOTrimazole**

**Indications** fungal skin infections; vaginal candidiasis (section 7.2.2); otitis externa (section 12.1.1)

**Cautions** see notes above

**Pregnancy** minimal absorption from skin; not known to be harmful

**Side-effects** see notes above

**Dose**

- Apply 2–3 times daily

**Clotrimazole** (Non-proprietary)

- **Cream**, clotrimazole 1%, net price 20 g = £1.52

**Canesten®** *(Bayer Consumer Care)*

- **Cream**, clotrimazole 1%, net price 20 g = £2.14, 50 g = £3.50

**Excipients** include benzyl alcohol, ceteostearly alcohol, polysorbate 60

**Solution**, clotrimazole 1% in macrogol 400 (polyethylene glycol 400), net price 20 mL = £2.43. For hairy areas

**Excipients** none as listed in section 13.1.3

**Spray**, clotrimazole 1%, in 30% isopropyl alcohol, net price 40-mL atomiser = £4.99. Label: 15. For large or hairy areas

**Excipients** include propylene glycol

---

**ECONAZOLE NITRATE**

**Indications** fungal skin infections; vaginal candidiasis (section 7.2.2)

**Cautions** see notes above

**Pregnancy** minimal absorption from skin; not known to be harmful

**Side-effects** see notes above

**Dose**

- Skin infections apply twice daily; nail infections, apply once daily under occlusive dressing

**Pevaryl®** *(Janssen-Cilag)*

**Cream**, econazole nitrate 1%, net price 30 g = £2.65

**Excipients** include butylated hydroxyanisole, fragrance

---

**GRISEOFULVIN**

**Indications** tinea pedis; resistant fungal infections (section 5.2.5)

**Cautions** see notes above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk

**Side-effects** see notes above

**Dose**

- Apply 400 micrograms (1 spray) to an area approx. 13 cm² once daily, increased to 1.2 mg (3 sprays, allowing each spray to dry between applications) once daily if necessary; max. treatment duration 4 weeks

---

**Note** Amorolfin nail lacquer can be sold to the public if supplied for the treatment of mild cases of distal and lateral subungual onychomycoses caused by dermatophytes, yeasts and moulds; subject to treatment of max. 2 nails, max. strength of nail lacquer amorolfin 5% and a pack size of 3 mL.
SALICYLIC ACID

**Indications**
- Fungal nail infections, particularly tinea; hyperkeratotic skin disorders (section 13.5.2); acne vulgaris (section 13.6.1); warts and calluses (section 13.7)

**Cautions**
- Avoid broken or inflamed skin
- Salicylate toxicity: Salicylate toxicity can occur particularly if applied on large areas of skin

**Pregnancy**
- Avoid

**Side-effects**
- See notes above

**Dose**
- **ADULT** and **CHILD** over 5 years, apply twice daily and after washing

**Phytox** *(Wynil)* Painter
- Salicylic acid 1.46% (total combined), tannic acid 4.89% and boric acid 3.12% (as borotannic complex), in a vehicle containing alcohol and ethyl acetate, net price 25 mL (with brush) = £2.81
- Excipients: none as listed in section 13.1.3
- **Note**: Flammable

TERBINAFINE

**Indications**
- Fungal skin infections

**Cautions**
- Avoid contact with eyes

**Pregnancy**
- Manufacturer advises use only if potential benefit outweighs risk—animal studies suggest no adverse effects

**Breast-feeding**
- Manufacturer advises avoid—present in milk, but less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest

**Side-effects**
- See notes above

**Dose**
- **ADULT** and **CHILD** over 1–2 weeks in tinea pedis, 1–2 weeks in tinea corporis and tinea cruris, 2 weeks in cutaneous candidiasis and pityriasis versicolor; review after 2 weeks; **CHILD** see BNF for Children

**Terbinafine** *(Non-proprietary)* *(BNF)*
- **Cream**, terbinafine hydrochloride 1%, net price 15 g = £5.10, 30 g = £2.69

1. Preparations of terbinafine hydrochloride (max. 1%) can be sold to the public for external use for the treatment of tinea pedis as a cream in a pack containing max. 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing max. 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing max. 30 mL spray or as a gel in a pack containing max. 30 g gel

**Lamisil** *(Novartis Consumer Health)* *(BNF)*
- **Cream**, terbinafine hydrochloride 1%, net price 15 g = £4.86, 30 g = £8.76
- **Excipients** include benzyl alcohol, cetaryl alcohol, polysorbate 60, stearyl alcohol
- **Tablets**—section 5.2.5

TIOCONAZOLE

**Indications**
- Fungal nail infections

**Cautions**
- See notes above

**Pregnancy**
- Manufacturer advises avoid

**Side-effects**
- See notes above; also local oedema, dry skin, nail discoloration, periungual inflammation, nail pain, rash, exfoliation
13.10.3 Antiviral preparations

**Aciclovir**

Aciclovir cream is licensed for the treatment of initial and recurrent labial and genital herpes simplex infections; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for herpes zoster (shingles) (for details of systemic use see section 5.3.2.1).

**Dose**

- Apply to nails and surrounding skin twice daily usually for up to 6 months (may be extended to 12 months)

**Trosyl** (Pfizer)

**Cutaneous solution**, tioconazole 28%, net price 12 mL (with applicator brush) = £27.38

**Excipients** none as listed in section 13.1.3

**Mycolta** (Thornton & Ross)

**Cream**, zinc undecenoate 20%, undecenoic acid 5%, net price 25 g = £1.64

**Excipients** include fragrance

**Dose**

- Treatment of athlete’s foot, apply twice daily continuing for 7 days after lesions have healed
- Prevention of athlete’s foot, apply once daily

**Powder**, zinc undecenoate 20%, undecenoic acid 2%, net price 70 g = £2.22

**Excipients** include fragrance

**Dose**

- Treatment of athlete’s foot, apply twice daily continuing for 7 days after lesions have healed
- Prevention of athlete’s foot, apply once daily

**Spray application**, undecenoic acid 3.9%, dichlorophen 0.4% (pressurised aerosol pack), net price 100 mL = £2.46

**Excipients** include fragrance

**Dose**

- Treatment of athlete’s foot, apply twice daily continuing for 7 days after lesions have healed
- Prevention of athlete’s foot, apply once daily

**UNDECENOATES**

**Indications** see under preparations below

**Side-effects** see notes above

**Dose**

- See under preparations below

**Mycolta**

**Cream**, zinc undecenoate 20%, undecenoic acid 5%, net price 25 g = £1.64

**Excipients** include fragrance

**Dose**

- Treatment of athlete’s foot, apply twice daily continuing for 7 days after lesions have healed
- Prevention of athlete’s foot, apply once daily

**PENCICLOVIR**

**Indications** see notes above

**Cautions** avoid contact with eyes and mucous membranes

**Side-effects** transient stinging, burning, numbness; hypersensitivity reactions also reported

**Vectavir** (Novartis Consumer Health)

**Cream**, penciclovir 1%, net price 2 g = £4.20

**Excipients** include cetostearyl alcohol, propylene glycol

**Dose**

- Herpes labialis, apply to lesions every 2 hours during waking hours for 4 days, starting at first sign of attack
- Children under 12 years, not recommended

**Dental prescribing on NHS** Aciclovir Cream may be prescribed

1. A 2 g tube and a pump pack are on sale to the public for the treatment of cold sores

**Zovirax** (GSK)

**Cream**, aciclovir 5%, net price 2 g = £4.63, 10 g = £12.96

**Excipients** include cetostearyl alcohol, propylene glycol

**Eye ointment**—section 11.3.3

**Tablets**—section 5.3.2.1

**ACICLOVIR** (Acyclovir)

**Indications** see notes above; herpes simplex and varicella–zoster infections (section 5.3.2.1); eye infections (section 11.3.3)

**Cautions** avoid contact with eyes and mucous membranes

**PREGNANCY** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk; limited absorption from topical aciclovir preparations

**SIDE-EFFECTS** transient stinging or burning; occasionally erythema, itching or drying of the skin

**Dose**

- Apply to lesions every 4 hours (5 times daily) for 5–10 days, starting at first sign of attack

**IDOXURIDINE IN DIMETHYL SULFOXIDE**

**Indications** herpes simplex and herpes zoster infection but of little value

**Cautions** avoid contact with the eyes, mucous membranes, and textiles; **interactions:** Appendix 1 (dimethyl sulfoxide)

**Contra-indications** not to be used in mouth

**PREGNANCY** teratogenic in animal studies—manufacturer advises avoid

**Breast-feeding** may make milk taste unpleasant

**Side-effects** stinging on application, changes in taste; overuse may cause maceration

**Herpid** (Astellas)

**Application**, idoxuridine 5% in dimethyl sulfoxide, net price 5 mL (with applicator) = £6.33

**Dose**

- Apply to lesions 4 times daily for 4 days, starting at first sign of attack
- Children under 12 years, not recommended
13.10.4 Parasiticidal preparations

**Suitable quantities of parasiticidal preparations**

<table>
<thead>
<tr>
<th>Skin creams</th>

</table>

These amounts are usually suitable for an adult for single application.

**Scabies**

Permethrin is used for the treatment of scabies (*Sarcoptes scabiei*); malathion can be used if permethrin is inappropriate.

Benzyl benzoate is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin (available on a named patient basis from ‘special-order’ manufacturers or specialist importing companies, see p. 988) in a single dose of 200 micrograms/kg by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone.

**Application** Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

**Itching** The itch and eczema of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema (section 13.5.1) may be required. Application of crotamiton can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a sedating antihistamine (section 3.4.1) at night may also be useful.

**Head lice**

Dimeticone is effective against head lice (*Pediculus humanus capitis*) and acts on the surface of the organism. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

**Wet combing methods** Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process. Combing devices and topical solutions to aid the removal of head lice are available; some of these products are prescribable on the NHS, including Bug Buster kit, Full Marks solution, Lyclear SprayAway, Nitcomb-M2, Nitcomb-S1, Nitlotion, and Nitty Gritty Nifree.

**Crab lice**

Permethrin and malathion are used to eliminate crab lice (*Pthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

**Benzyl benzoate**

Benzyl benzoate is effective for scabies but is not a first-choice for scabies (see notes above).

**BENZYL BENZOATE**

**Indications** scabies (but see notes above)

**Cautions** children (not recommended, see also under Dose, below); avoid contact with eyes and mucous membranes; do not use on broken or secondarily infected skin

**Breast-feeding** suspend feeding until product has been washed off

**Side-effects** skin irritation, burning sensation especially on genitalia and excoriations, occasionally rashes
13.10.4 Parasiticidal preparations

- Scabies, apply 0.5% preparation over whole body, and wash off after 24 hours; if hands are washed with soap within 24 hours, they should be retreated; see also notes above; repeat application after 7 days

**Note** For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears

**Derbac-M® (SSL)**

**Liquid**, malathion 0.5% in an aqueous basis, net price 50 mL = £2.37, 200 mL = £5.93

**Excipients** include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens)

For crab lice, head lice, and scabies

---

**BNF 61**

**Dose**

- Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

**Note** Not recommended for children—dilution to reduce irritant effect also reduces efficacy. Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears

**Malathion**

Malathion is recommended for scabies, head lice and crab lice (for details see notes above).

The risk of systemic effects associated with 1–2 applications of malathion is considered to be very low; however, applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be avoided since the likelihood of eradication of lice is not increased.

**DIMETICONE**

**Indications** head lice

**Cautions** avoid contact with eyes; children under 6 months, medical supervision required

**Side-effects** skin irritation

**Dose**

- Rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight); repeat application after 7 days

**Hedrin® (Thornton & Ross)**

**Lotion**, dimeticone 4%, net price 50 mL = £2.98, 120 mL spray pack = £7.13, 150 mL = £6.92

**Note** Patients should be told to keep hair away from fire and flames during treatment

**MALATHION**

**Indications** see notes above and under preparations

**Cautions** avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required

**Side-effects** skin irritation and hypersensitivity reactions; chemical burns also reported

**Dose**

- Head lice, rub 0.5% preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours (see also notes above); repeat application after 7 days

- Crab lice, apply 0.5% aqueous preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight; repeat application after 7 days

**Lyclear® Creme Rinse (Chefaro UK)**

**Cream rinse**, permethrin 1% in basis containing isopropyl alcohol 20%, net price 59 mL = £2.38, 2 x 59mL pack = £4.32

**Excipients** include cetyl alcohol

**Dose** head lice, not recommended, therefore no dose stated (insufficient contact time)

**Lyclear® Dermal Cream (Chefaro UK)**

**Dermal cream**, permethrin 5%, net price 30 g = £5.71

**Label**: 10, patient information leaflet

**Excipients** include butylated hydroxytoluene, wool fat derivative
13.10.5 Preparations for minor cuts and abrasions

Some of the preparations listed are used in minor burns, and abrasions. They are applied as necessary but should not be used on large wounds or for prolonged periods because of the possibility of hypersensitivity. The effervescence of hydrogen peroxide (section 13.11.6) is used to clean minor cuts and abrasions. Preparations containing camphor and sulphonamides should be avoided. Preparations such as magnesium sulphate paste are also listed but are now rarely used to treat carbuncles and boils as these are best treated with antibiotics (section 5.1.1.2).

Cetrimide Cream, BP
Cream, cetrimide 0.5% in a suitable water-miscible basis such as cetostearyl alcohol 5%, liquid paraffin 50% in freshly boiled and cooled purified water, net price 50 g = £1.11

Proflavine Cream, BPC
Cream, proflavine hemisulphate 0.1%, yellow beeswax 2.5%, chlorocresol 0.1%, liquid paraffin 67.3%, freshly boiled and cooled purified water 25%, wool fat 5%, net price 100 mL = £1.59

Excipients include beeswax, wool fat
Note Stains clothing

Preparations for boils
Magnesium Sulphate Paste, BP
Paste, dried magnesium sulphate 45 g, glycerol 55 g, phenol 500 mg, net price 25 g = 75p, 50 g = 87p
Note Should be stirred before use
Dose apply under dressing

Collodion
Flexible collodion may be used to seal minor cuts and wounds that have partially healed.

Collodion, Flexible, BP
Collodion, castor oil 2.5%, colophony 2.5% in a collodion basis, prepared by dissolving pyroxylin (10%) in a mixture of 3 volumes of ether and 1 volume of alcohol (90%), net price 10 mL = 38p. Label: 15

Contra-indications allergy to colophony in elastic adhesive plasters and tape

Skin tissue adhesive
Tissue adhesives are used for closure of minor skin wounds and for additional suture support. They should be applied by an appropriately trained healthcare professional. Skin tissue adhesives may cause skin sensitisation.

Dermabond ProPen® (Ethicon)
Topical Skin Adhesive, sterile, octyl 2-cyanoacrylate, net price 0.5 mL = £18.38

Epiglu® (Schuco)
Tissue adhesive, sterile, ethyl-2-cyanoacrylate 95.4 mg/g, polymethylmethacrylate, net price 4 × 3-g vials = £149.50 (with dispensing pipettes and pallette)

Histoacryl® (Braun)
Tissue adhesive, sterile, enubcrulate, net price 5 × 200-mg unit (blue) = £22.00, 10 × 200-mg unit (blue) = £67.20, 5 × 500-mg unit (clear or blue) = £34.65, 10 × 500-mg unit (blue) = £69.30

LiquiBand® (MedLogic)
Tissue adhesive, sterile, enubcrulate, net price 0.5-g amp = £5.50

13.11 Skin cleansers, antiseptics, and preparations for promotion of wound healing

13.11.1 Alcohols and saline

Alcohols and saline

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment (section 13.2.1) that do not irritate the skin are best used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine or povidone-iodine, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics (section 13.2.1).

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate solution 1 in 10 000, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry. It can stain skin and nails especially with prolonged use.

13.11.1 Alcohols and saline

Alcohol

Indications skin preparation before injection

Cautions flammable; avoid broken skin; patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

Industrial Methylated Spirit, BP
Solution, 19 volumes of ethanol and 1 volume approved wood naphtha, net price ‘66 OP’ (containing 95% by volume alcohol) 100 mL = 40p, ‘74 OP’ (containing 99% by volume alcohol) 100 mL = 39p. Label: 15
13.11.2 Chlorhexidine salts

**Chlorhexidine**

*Indications*  
See under preparations; bladder irrigation and catheter patency solutions (see section 7.4.4).  
*Cautions*  
Avoid contact with eyes, brain, meninges and catheter (see section 11.8.1); eye (section 12.3.4).  
*Side-effects*  
For skin disinfection before invasive procedures, CHILD under 2 months, not recommended.  

**Note**  
Flammable

**CX Antiseptic Dusting Powder®** (Ecolab)  
*Dusting powder*, sterile, chlorhexidine acetate 1%, net price 15 g = £3.40  
For skin disinfection

**Hibiscrub®** (Mölnlycke)  
*Cleansing solution*, red, chlorhexidine gluconate 4%, perfumed, in a surfactant solution, net price 250 mL = £4.25, 500 mL = £5.25, 1 litre = £9.75  
*Excipients* include fragrance

Use instead of soap for pre-operative hand and skin preparation and for general hand and skin disinfection

**Hibi® Liquid Hand Rub+®** (Mölnlycke)  
*Solution*, chlorhexidine gluconate 0.5%, in isopropyl alcohol 70%, net price 500 mL = £5.25  
To be used undiluted for hand and skin disinfection

**Hibitane Obstetric®** (Derma UK)  
*Cream*, chlorhexidine gluconate solution 5% (≈ 1% chlorhexidine gluconate), in a pourable water-miscible basis, net price 250 mL = £4.44  
For use in obstetrics and gynaecology as an antiseptic and lubricant (for application to skin around vulva and perineum and to hands of midwife or doctor)

**Hydrex®** (Ecolab)  
*Solution*, chlorhexidine gluconate solution 2.5% (= chlorhexidine gluconate 0.5%), in an alcoholic solution, net price 600 mL (clear) = £2.72, 600 mL (pink) = £2.72, 200-mL spray = £1.77, 500-mL spray = £3.01; 600 mL (blue) = £2.26  
For pre-operative skin disinfection  
*Note* Flammable

**Surgical scrub**, chlorhexidine gluconate 4% in a surfactant solution, net price 250 mL = £2.44, 500 mL = £2.58  
For pre-operative hand and skin preparation and for general hand disinfection

**Unisept®** (Medlock)  
*Solution* (sterile), pink, chlorhexidine gluconate 0.05%, net price 25 × 25-mL sachet = £5.40; 10 × 100-mL sachet = £6.67  
For cleansing and disinfecting wounds and burns and swabbing in obstetrics  
*With cetrimide*  
**Tisept®** (Medlock)  
*Solution* (sterile), yellow, chlorhexidine gluconate 0.015%, cetrimide 0.15%, net price 25 × 25-mL sachet = £5.20; 10 × 100-mL sachet = £6.68  
To be used undiluted for general skin disinfection and wound cleansing

**Travasept 100®** (Baxter)  
*Solution* (sterile), yellow, chlorhexidine acetate 0.015%, cetrimide 0.15%, net price 500 mL = £7.20, 1 litre = £77p  
To be used undiluted in skin disinfection such as wound cleansing and obstetrics

---

**SODIUM CHLORIDE**

*Indications*  
See notes above; nebuliser diluent (section 3.1.5); sodium depletion (section 9.2.1.2); electrolyte imbalance (section 9.2.2.1); eye (section 11.8.1); oral hygiene (section 12.3.4).

**Sodium Chloride (Non-proprietary)**  
*Solution* (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £5.50, 200-mL can = £2.65, 1 litre = £9.75

**FlowFusor®** (Fresenius Kabi)  
*Solution* (sterile), sodium chloride 0.9%, net price 120-mL Bellows Pack = £1.53

**Irriclen®** (Convatec)  
*Solution* in aerosol can (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £5.50

**Irripod®** (C D Medical)  
*Solution* (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £5.50

**Miniversol®** (Aguettant)  
*Solution* (sterile), sodium chloride 0.9%, net price 30 × 45-mL unit = £13.20; 30 × 100-mL unit = £19.50

**Normasol®** (Mölnlycke)  
*Solution* (sterile), sodium chloride 0.9%, net price 25 × 25-mL sachet = £6.14, 10 × 100-mL sachet = £7.47

**Stericlens®** (C D Medical)  
*Solution* in aerosol can (sterile), sodium chloride 0.9%, net price 100-mL can = £1.94, 240-mL can = £2.95

**Steripod® Sodium Chloride** (Medlock)  
*Solution* (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £7.57

---

**BNF 61**

**Surgical Spirit, BP**  
*Spirit*, methyl salicylate 0.5 mL, diethyl phthalate 2%, castor oil 2.5%, in industrial methylated spirit, net price 100 mL = 20p. Label: 15

**ChloroPrep®** (Enturia)  
*Cutaneous solution*, sterile, chlorhexidine gluconate 2% in isopropyl alcohol 70%, net price (single applicator) 0.67 mL = 30p, 1.5 mL = 65p, 3 mL = 85p, 10.5 mL = £2.92, 26 mL = £6.50; (single applicator, with tint) 3 mL = 80p, 10.5 mL = £3.07, 26 mL = £6.83

For skin disinfection before invasive procedures, CHILD under 2 months, not recommended

**Note** Flammable

The table lists marketed preparations of chlorhexidine as of September 2017. Prices include excipients.

**Steripod**  
Per 240 mL: £2.72, 200-mL spray = £1.77, 500-mL spray = £3.01; 600 mL (blue) = £2.26

**Sodium Chloride**  
Per 240 mL: £2.72, 200-mL spray = £1.77, 500-mL spray = £3.01; 600 mL (blue) = £2.26

**Travasept 100**  
Per 1 litre: £2.48, 500 mL = £1.54, 100 mL = 97p

---
13.11.3 Cationic surfactants and soaps

CETRIMIDE

Indications skin disinfection

Cautions avoid contact with eyes; avoid use in body cavities

Side-effects skin irritation and occasionally sensitisation

Preparations Ingredient of Tisept® and Travasept® 100, see above

13.11.4 Iodine

POVIDONE–IODINE

Indications skin disinfection

Cautions broken skin (see below)

Large open wounds The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

Contra-indications preterm neonate gestational age under 32 weeks; avoid regular use in patients with thyroid disorders or those receiving lithium therapy

Renal impairment avoid regular application to inflamed or broken mucosa

Pregnancy sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester

Breast-feeding avoid

Side-effects rarely sensitivity; may interfere with thyroid function tests

Betadine® (Mölnlycke) Dry powder spray, povidone–iodine 2.5% in a pressurised aerosol unit, net price 150-g unit = £2.63

For skin disinfection, particularly cleansing and deodorising wounds and ulcers

Note Not for use in serous cavities

Savlon® Dry (Novartis Consumer Health) Powder spray, povidone–iodine 1.14% in a pressurised aerosol unit, net price 50-mL unit = £2.39

For minor wounds

Videne® (Ecolab) Alcoholic tincture, povidone–iodine 10%, net price 500 mL = £3.46

To be applied undiluted in pre-operative skin disinfection

Antiseptic solution, povidone–iodine 10% in aqueous solution, net price 500 mL = £3.46

To be applied undiluted in pre-operative skin disinfection and general antiseptic

Surgical scrub, povidone–iodine 7.5% in aqueous solution, net price 500 mL = £3.46

To be used as a pre-operative scrub for hand and skin disinfection

13.11.5 Phenolics

Triclosan has been used for disinfection of the hands and wounds, and for disinfection of the skin before surgery.

13.11.6 Oxidisers and dyes

HYDROGEN PEROXIDE

Indications see under preparations below

Cautions large or deep wounds; avoid on healthy skin and eyes; bleaches fabric; incompatible with products containing iodine or potassium permanganate

Hydrogen Peroxide Solution, BP

Solution 6% (20 vols), net price 200 mL = 45p

Solution 3% (10 vols), net price 200 mL = 44p

For skin disinfection, particularly cleansing and deodorising wounds and ulcers

Note The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed.

Important Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions

Crystacide® (GP Pharma) Cream, hydrogen peroxide 1%, net price 10 g = £4.82, 25 g = £8.07, 40 g = £11.62

Dose superficial bacterial skin infection, apply 2–3 times daily for up to 3 weeks

Excipients include edetic acid (EDTA), propylene glycol

POTASSIUM PERMANGANATE

Indications cleansing and deodorising suppurating eczematous reactions and wounds

Cautions irritant to mucous membranes

Dose

- Wet dressings or baths, approx. 0.01% solution

Note Stains skin and clothing

Potassium Permanganate Solution

Solution, potassium permanganate 0.1% (1 in 1000) in water

Dose to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution

Permitabs® (Alliance) Solution tablets, for preparation of topical solution, potassium permanganate 400 mg, net price 30-tab pack = £9.85

Note 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution

13.11.7 Preparations for promotion of wound healing

Desloughing agents

Alginate, hydrogel and hydrocolloid dressings (Appendix 8) are effective at wound debridement. Sterile larvae (maggots) (LarvEx®, Zoobiotic) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised; gravitational dermatitis may be complicated by superim-
posed contact sensitivity to substances such as neomyacin or lanolin.

For further information on wound management products see Appendix 8, p. 935.

**Growth factor**

A topical preparation of becaplermin (recombinant human platelet-derived growth factor) is licensed as an adjunct treatment of full-thickness, neuropathic, diabetic ulcers. It enhances the formation of granulation tissue, thereby promoting wound healing.

**BECAPLERMIN**

(Recombinant human platelet-derived growth factor)  

**Indications** see notes above  

**Cautions** avoid sites with infection, or peripheral arteriopathy  

**Contra-indications** malignant disease  

**Side-effects** pain; infections including cellulitis and osteomyelitis; local reactions including erythema; rarely bullous eruption, oedema, and hypertrophic granulation  

**Dose**  
- Full-thickness, neuropathic, diabetic ulcers (no larger than 5 cm²), apply thin layer daily and cover with gauze dressing moistened with physiological saline; max. duration of treatment 20 weeks (reassess if no healing after first 10 weeks); **CHILD** under 18 years see BNF for Children  
- Regranex® (Janssen-Cilag) Gel, becaplermin (recombinant human platelet-derived growth factor) 0.01%, net price 15 g = £240.92  
  Excipients include hydroxybenzenes (parabens)  

**13.12 Antiperspirants**

Aluminium chloride is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use glycopyrronium bromide as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. Botox® contains botulinum toxin type A complex and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment (section 4.9.3).

**ALUMINIUM SALTS**

**Indications** see under Dose below  

**Cautions** avoid contact with eyes or mucous membranes; avoid use on broken or irritated skin; do not shave axillae or use depilatories within 12 hours of application; avoid contact with clothing  

**Side-effects** skin irritation  

**Dose**  
- Hyperhidrosis affecting axillae, hands or feet, apply liquid formulation at night to dry skin, wash off the following morning, initially daily then reduce frequency as condition improves—do not bathe immediately before use  
- Hyperhidrosis, bromidrosis, intertrigo, and prevention of tinea pedis and related conditions, apply powder to dry skin  

**Anhydrol® Forte (Dermal)**  

**Solution** (= application), aluminium chloride hexahydrate 20% in an alcoholic basis, net price 60-mL bottle with roll-on applicator = £2.51. Label: 15  

Excipients none as listed in section 13.1.3  

**Driclor® (Stiefel)**  

**Application**, aluminium chloride hexahydrate 20% in an alcoholic basis, net price 75-mL bottle with roll-on applicator = £3.01. Label: 15  

Excipients none as listed in section 13.1.3  

1. A 30-mL pack is on sale to the public  

**ZeaSORB®** (Stiefel)  

**Dusting powder**, aldioxa 0.22%, chloroxylenol 0.5%, net price 50 g = £2.61  

Excipients include fragrance  

**13.13 Topical circulatory preparations**

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective. Sclerotherapy of varicose veins is described in section 2.13.

Rubefacients are described in section 10.3.2.

**Hirudoid® (Genus)**  

**Cream**, heparinoid 0.3% in a vanishing-cream basis, net price 50 g = £3.99  

Excipients include cetostearyl alcohol, hydroxybenzenes (parabens)  

**Gel**, heparinoid 0.3%, net price 50 g = £3.99  

Excipients include propylene glycol, fragrance  

**Dose** apply up to 4 times daily in superficial soft-tissue injuries and superficial thrombophlebitis
Active immunity can be acquired by natural disease or by vaccination. Vaccines stimulate production of antibodies and other components of the immune mechanism; they consist of either:

1. a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
2. inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
3. detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
4. extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice in this chapter reflects that in the handbook Immunisation against Infectious Disease (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Cautions Most individuals can safely receive the majority of vaccines. Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset. See also Predisposition to Neurological Problems, below. For individuals with bleeding disorders, see Route of administration, below. If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more vaccines are required (and are not available as a combined preparation), they should be given simultaneously at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart (but see also BCG Vaccines, p. 750). When 2 live vaccines cannot be given at the same time, they should be separated by an interval of at least 4 weeks. For interactions see Appendix 1 (vaccines).

See also Cautions under individual vaccines

Contra-indications Vaccines are contra-indicated in those who have a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines). The presence of the following excipients in vaccines and immunological products has been noted under the relevant entries:

- Gelatin
- Gentamicin
- Neomycin
- Kanamycin
- Polymyxin B
- Streptomycin
- Thiomersal

Hypersensitivity to egg with evidence of previous anaphylactic reaction, contra-indicates influenza vaccine (prepared in hens’ eggs), tick-borne encephalitis vaccine, and yellow fever vaccine. See also Cautions under MMR vaccine.

See also Vaccines and HIV infection, below.

Live vaccines may be contra-indicated temporarily in individuals who are:

- immunosuppressed (see Impaired immune response, below);
- pregnant (see Pregnancy and breast-feeding, below).

See also Contra-indications under individual vaccines.

Impaired immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines. Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency). Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: adults, at
least 40 mg daily for more than 1 week; children, 2 mg/ kg daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. For special reference to HIV infection, see below.

**Pregnancy** Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease (e.g. to yellow fever), the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during pregnancy, see under individual vaccines.

**Breast-feeding** Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during breast-feeding, see under individual vaccines.

**Side-effects** Injection of a vaccine may be followed by local reactions such as pain, inflammation, redness, and lymphangitis. An induration or sterile abscess may develop at the injection site. Gastro-intestinal disturbances, fever, headache, irritability, loss of appetite, fatigue, myalgia, and malaise are among the most commonly reported side-effects. Other side-effects include influenza-like symptoms, dizziness, paraesthesia, asthenia, drowsiness, arthralgia, rash, and lymphadenopathy. Hypersensitive reactions, such as bronchospasm, angioedema, urticaria, and anaphylaxis, are very rare but can be fatal (see section 3.4.3 for management of allergic emergencies).

**Oral** vaccines such as cholera, live poliomyelitis, rotavirus, and live typhoid can also cause gastro-intestinal disturbances such as nausea, vomiting, abdominal pain and cramps, and diarrhoea.

See also *Predisposition to neurological problems, below.*

Some vaccines (e.g. poliomyelitis) produce very few reactions, while others (e.g. measles, mumps and rubella) may cause a very mild form of the disease. Occasionally more serious adverse reactions can occur—these should always be reported to the CHM (see *Adverse Reactions to Drugs, p. 12*). See also Preterm Birth, p. 748.

---

### Post-immunisation pyrexia in infants

The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed, a dose of paracetamol can be given and, if necessary, a second dose can be given 6 hours later; ibuprofen may be used if paracetamol is unsuitable. The parent should be warned to seek medical advice if the pyrexia persists.

For post-immunisation pyrexia in an infant aged 2–3 months, the dose of paracetamol is 60 mg; the dose of ibuprofen is 50 mg (on a doctor’s advice). An oral syringe can be obtained from any pharmacy to give the small volume required.

### Predisposition to neurological problems

When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contraindication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the management of fever (see Post-immunisation pyrexia in infants, above) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and perinatal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

Further information on adverse effects associated with specific vaccines can be found under individual vaccines.

**Vaccines and HIV infection**

HIV-positive individuals with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired), varicella–zoster (but avoid if immunity significantly impaired—consult product literature), and the following inactivated vaccines:
  - anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papilloma virus, influenza, meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive individuals should not receive:

- BCG, typhoid (oral), yellow fever

Note The above advice differs from that for other immunocompromised patients. *Immunisation Guidelines for HIV-infected Adults* issued by British HIV Association (BHIVA) are available at www.bhiva.org.uk and, *Immunisation of HIV-infected Children* issued by Children’s HIV Association (CHIVA) are available at www.chiva.org.uk

---

1. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

2. Use of normal immunoglobulin should be considered after exposure to measles (see p 769) and varicella–zoster immunoglobulin considered after exposure to chickenpox or herpes zoster (see p. 772).

3. The Royal College of Paediatrics and Child Health recommends that MMR is not given to a child with HIV infection whilst severely immunosuppressed.

4. If yellow fever risk is unavoidable, specialist advice should be sought.
Immunisation schedule
Vaccines for the childhood immunisation schedule should be obtained from local health organisations or direct from Movianto—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

Preterm birth
Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks postmenstrual age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks’ gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* (type b), meningococcal C, and hepatitis B after primary immunisation.

When to immunise (for pre-mature infants—see note above)

</table>

¹. The two human papilloma virus vaccines are not interchangeable and one vaccine product should be used for the entire course; however for individuals with previous incomplete vaccination with Gardasil® who are eligible for HPV vaccination under the national programme, Cervarix® can be used to complete the vaccination course if necessary; the individual must be informed that Cervarix® does not protect against genital warts.
Vaccines and asplenia  The following vaccines are recommended for asplenic patients or those with splenic dysfunction:
  haemophilus influenzae type b; influenza; meningococcal A, C, W135, and Y conjugate; pneumococcal.

For antibiotic prophylaxis in asplenia see p. 330.

Route of administration  Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route; some vaccines are given by others routes—the intradermal route for BCG vaccine, deep subcutaneous route for Japanese encephalitis, and varicella vaccine, and the oral route for cholera, live poliovirus, rotavirus, and live typhoid vaccines. The intramuscular route should not be used in patients with bleeding disorders such as haemophilia or thrombocytopenia. Vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

Note  The Department of Health has advised against the use of jet guns for vaccination owing to the risk of transmitting bloodborne infections, such as HIV.

High-risk groups  For information on high-risk groups, see section 14.4 under individual vaccines

Tetanus Vaccines

14.2 Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins, section 14.5). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antiserum, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

14.3 Storage and use

Care must be taken to store all vaccines and other immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many vaccines and immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Vaccines and immunoglobulins should be protected from light. Reconstituted vaccines and opened multi-dose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be appropriately mixed to ensure uniformity of the material to be injected.

14.4 Vaccines and antisera

Availability  Anthrax and yellow fever vaccines, botulism antitoxin, diphtheria antitoxin, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning, p. 41.

Enquiries for vaccines not available commercially can also be made to:

Immunisation Policy, Monitoring and Surveillance
Department of Health
Wellington House
133–155 Waterloo Road
London, SE1 8UG
vaccine.supply@dh.gsi.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health. In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff, CF14 4XW
Tel: (029) 2074 2979

and in Northern Ireland:

Pharmacy and Medicines Management Centre
Beech House
Antrim Hospital Site
Northern Health and Social Care Trust
Bush Road
Antrim, BT41 2RL
rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

Anthrax vaccine

Anthrax vaccine is made from antigens from B. anthracis. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with Bacillus anthracis. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with B. anthracis, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis (section 5.1.12). Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from the Centre for Infections, Health Protection Agency (tel. 020 8200 4400).
BCG vaccines

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from Mycobacterium bovis which stimulates the development of hypersensitivity to M. tuberculosis. BCG vaccine should be given intradermally by operators skilled in the technique (see below).

The expected reaction to successful BCG vaccination is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded. Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see section 14.1; for the treatment of infection following vaccination, seek expert advice.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out:

- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100,000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100,000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100,000;
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100,000 (section 14.6).

BCG vaccine can be given simultaneously with another live vaccine (see also section 14.1), but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

For advice on chemoprophylaxis against tuberculosis, see section 5.1.9; for the treatment of infection following vaccination, seek expert advice.

1. List of countries or primary care trusts where the incidence of tuberculosis is greater than 48 cases per 100,000 is available at www.hpa.org.uk

2. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients.
showing tips of hair follicles is sign of correct injection; 7 mm bleb = 0.1 mL injection, 3 mm bleb = 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

To be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.

### Intradermal

**Bacillus Calmette-Guérin Vaccine**

**Injection (powder for suspension)**, freeze-dried preparation of live bacteria of a strain derived from the bacillus of Calmette and Guérin. Available from health organisations or direct from Movianto (SSI brand, multidose vial with diluent).

### Diagnostic agents

The Mantoux test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at [www.dh.gov.uk/imunisation](http://www.dh.gov.uk/imunisation).

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD). The Heaf test (involving the use of multiple-puncture apparatus) is no longer available.

**Note** Response to tuberculin may be suppressed by live viral vaccines, viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment. Tuberculin testing should not be carried out within 4 weeks of receiving a live viral vaccine.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: QuanitFERON® Gold and T-SPO® T.B. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see [www.hpa.org.uk](http://www.hpa.org.uk).

### Tuberculin Purified Protein Derivative

**Injection**, heat-treated products of growth and lysis of appropriate *Mycobacterium* spp. 20 units/mL (2 units/0.1-mL dose) (for routine use), 1.5-mL vial; 100 units/mL (10 units/0.1-mL dose), 1.5-mL vial from intradermal injection, for Mantoux test, 2 units (0.1 mL of 20 units/mL strength) for routine Mantoux test; if first test is negative and a further test is considered appropriate 10 units (0.1 mL of 100 units/mL strength) from intradermal injection.

Available from Movianto (SSI brand)

**Note** The strength of tuberculin PPD in this product may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

### Botulinum Antitoxin

A polyvalent botulinum antitoxin is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection. Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

### Botulinum Antitoxin

A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

**Note** The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

**Dose** prophylaxis, consult product literature. Available from local designated centres, for details see TOXBASE (requires registration) [www.toxbase.org](http://www.toxbase.org). For supplies outside working hours apply to other designated centres or to the duty doctor at the Health Protection Agency (Tel (020) 8200-8808). For major incidents, obtain supplies from the local blood bank.

### Cholera vaccine

**Cholera vaccine** (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations (see also section 14.6). Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential. **Injectable cholera vaccine** provides unreliable protection and is no longer available in the UK.

### Inflammatory diseases and vaccines

**CHOLERA VACCINE**

**Indications** see notes above

**Cautions** see section 14.1 and notes above

**Contra-indications** see section 14.1; also acute gastro-intestinal illness

**Pregnancy** see p. 747

**Breast-feeding** see p. 747

**Side-effects** see section 14.1; also rarely respiratory symptoms such as rhinitis and cough; very rarely sore throat, insomnia

**Dose**

- **ADULT** and **CHILD** over 6 years 2 doses separated by an interval of 1–6 weeks; **CHILD** 2–6 years 3 doses each separated by an interval of 1–6 weeks

**Note** If more than 6 weeks have elapsed between doses, the primary course should be restarted

- A single booster dose can be given 2 years after primary course for adults and children over 6 years, and 6 months after primary course for children 2–6 years. If more than 2 years have elapsed since the last vaccination, the primary course should be repeated

Conselliong: Dissolve 0.5 g of the crystalline powder in the recommended saline solution (approximately 15 mL). The solution should be injected into the deltoid muscle. After administration, parents and children should be advised to drink at least 2 hours of water, food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination
14 Immunological products and vaccines

14.4 Vaccines and antisera

Dukoral® (Crucess) (BHMS)
Oral suspension, for dilution with solution of effervescent sodium bicarbonate granules, heat- and formaldehyde-inactivated Inaba (including El-Tor biotype) and Ogawa strains of Vibrio cholerae bacteria and recombinant cholera toxin B-subunit produced in V. cholerae, net price 2-dose pack = £23.42. Counselling, administration

Diphtheria vaccines

Diphtheria vaccines are prepared from the toxin of Corynebacterium diphtheriae and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as ‘high dose’ or ‘low dose’. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule, section 14.1). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 5 years if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component, poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule, section 14.1). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Travel Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule (see also section 14.6). If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

Contacts Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with C. diphtheriae or C. ulcerans should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. Adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. For advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual, see Table 2, section 5.1.

DIPHTHERIA-CONTAINING VACCINES

Indications see notes above
Cautions see section 14.1 and see also individual components of vaccines

Diphtheria-containing vaccines for children under 10 years

Important Not recommended for persons aged 10 years or over (see Diphtheria-containing Vaccines for Children over 10 years and Adults, p. 753)

Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed) (BMS)
Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis, inactivated poliomyelitis and Haemophilus influenzae type b (conjugated to tetanus protein), net price 0.5-mL vial = £19.94 Excipients may include neomycin, polymyxin B and streptomycin Dose by intramuscular injection, CHILD 2 months–10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month; see also notes on booster doses, above Brands include Pedipur®, available as part of childhood immunisation schedule, from health organisations or Movianto

Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine (BMS)
Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £17.56 Excipients may include neomycin and polymyxin B Dose by intramuscular injection, CHILD 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL, see also notes on booster doses, above Brands include Infanrix-IPV®, available as part of childhood immunisation schedule, from health organisations or Movianto
Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine (Pm)

Injection, suspension of diphtheria toxoid [low dose], tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5 mL prefilled syringe = £11.98

Excipients may include neomycin, polymyxin B and streptomycin

Dose by intramuscular injection, CHILD 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL, see also notes on booster doses, above

Brands include Repevax®, available as part of childhood immunisation schedule, from health organisations or Movianto

Diphtheria-containing vaccines for children over 10 years and adults

A low dose of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses.

Adsorbed Diphtheria [low dose], Tetanus and Poliomyelitis (Inactivated) Vaccine (Pm)

Injection, suspension of diphtheria toxoid [low dose], tetanus toxoid and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5 mL prefilled syringe = £6.35

Excipients may include neomycin, polymyxin B and streptomycin

Dose by intramuscular injection, ADULT and CHILD over 10 years, primary immunisation, 3 doses each of 0.5 mL, separated by intervals of 1 month, second booster dose, 0.5 mL given 10 years after first booster dose (may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine); see also notes on booster doses and contacts, above

Brands include Repevax®, available as part of immunisation schedule, from health organisations or Movianto

Diphtheria antitoxin

Diphtheria antitoxin is used for passive immunisation in suspected cases of diphtheria only (without waiting for bacteriological confirmation); tests for hypersensitivity should be first carried out. It is derived from horse serum, and reactions are common after administration; resuscitation facilities should be available immediately.

It is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis (section 5.1, table 2) and vaccine (see Contacts above).

Diphtheria Antitoxin (Pm)

Dip/Ser

Dose prophylaxis, not recommended therefore no dose stated (see notes above)

Treatment, consult product literature

Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241)

Haemophilus type B conjugate vaccine

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combina-

tion with diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule, section 14.1) (see under Diphtheria-containing Vaccines). For infants under 1 year, the course consists of 3 doses of a vaccine containing haemophilus influenzae type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

For use of Rifampicin in the prevention of secondary cases of *Haemophilus influenzae* type b disease, see Table 2, section 5.1.

Asplenia or splenic dysfunction

Haemophilus influenzae type b vaccine is recommended for patients with asplenia or splenic dysfunction. Immunised adults and children over 1 year, who develop splenic dysfunction, should be given 1 additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). For elective splenectomy, the vaccine should ideally be given at least 2 weeks before surgery. Adults and children over 1 year, who are not immunised against haemophilus influenzae type b, should be given 2 doses of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) with an interval of 2 months between doses. However, children under 10 years, who are not immunised against diphtheria, tetanus, pertussis, poliomyelitis, and haemophilus influenzae type b should be given 3 doses (with an interval of 1 month between doses) of combined diphtheria, tetanus, pertussis (acellular component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine.

Complement deficiency

Individuals who have been fully immunised with haemophilus influenzae type b vaccine, and who subsequently become complement deficient, may require further doses of haemophilus influenzae type b vaccine if they have insufficient antibody levels.

**HAEMOPHILUS TYPE B CONJUGATE VACCINE**

**Indications** see notes above

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 747
Breast-feeding see p. 747
Side-effects see section 14.1; also atopic dermatitis and hypotonia
Dose
- Primary immunisation, see under Diphtheria
- Booster dose, see notes above and under preparation below

Menitrix® (GSK) 
Injection, powder for reconstitution, capular polysaccharide of Haemophilus influenzae type b and capular polysaccharide of Neisseria meningitidis group C (both conjugated to tetanus protein), net price single-dose vial (with syringe containing 0.5 mL diluent) = £29.87
Dose by intramuscular injection, CHILD 1–10 years, 0.5 mL ADULT and CHILD over 1 year, with asplenia or splenic dysfunction (see notes above), 0.5 mL. Available as part of the childhood immunisation schedule from Movano

Combined vaccines
See also under Diphtheria-containing Vaccines

Hepatitis A vaccine

Hepatitis A vaccine is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells.

Immunisation is recommended for:
- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas (see p. 774);
- laboratory staff who work directly with the virus;
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:
- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix® can also be used.

Intramuscular normal immunoglobulin (section 14.5.1) is recommended for use in addition to Hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

HEPATITIS A VACCINE

Indications immunisation against hepatitis A infection
Cautions see section 14.1
Contra-indications see section 14.1
Pregnancy see p. 747
Breast-feeding see p. 747
Side-effects see section 14.1: for combination vaccines, see also Typhoid vaccine, p. 767
Dose
- See under preparations

Single component

Avaxim® (Sanofi Pasteur) 
Injection, suspension of formaldehyde-inactivated hepatitis A virus (GBM grown in human diploid cells) 320 antigen units/mL adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £18.10
Excipients include neomycin
Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose
Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with Avaxim®. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

Epaxal® (Crucell) 
Injection, suspension of formaldehyde-inactivated hepatitis A virus (RG-SB grown in human diploid cells) at least 48 units/mL, net price 0.5 mL prefilled syringe = £23.81
Dose by intramuscular injection (see note below), ADULT and CHILD over 1 year, 0.5 mL as a single dose; booster dose 0.5 mL, 6–12 months after initial dose (1–6 months if splenicomised)
Note Booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Havrix Monodose® (GSK) 
Injection, suspension of formaldehyde-inactivated hepatitis A virus (HM 175 grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, net price 1-mL prefilled syringe = £22.14, 0.5-mL (720 ELISA units) prefilled syringe (Havrix Junior Monodose®) = £16.77
Excipients include neomycin
Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 1 mL as a single dose; booster dose, 1 mL 6–12 months after initial dose; CHILD 1–15 years 0.5 mL, booster dose, 0.5 mL, 6–12 months after initial dose
Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with Havrix Monodose®. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Vaqta® Paediatric (Sanofi Pasteur) 
Injection, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxide, net price 0.5 mL prefilled syringe = £28.35
Dose by intramuscular injection (see note below), ADULT and CHILD over 1 year, 0.5 mL as a single dose; booster dose, 0.5 mL 6–12 months after initial dose
Note Booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose with Havrix Monodose®. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.
hydroxyphosphate sulphate, net price 0.5-mL prefilled syringe = £14.74
*Excipients* include neomycin

**Dose** by intramuscular injection (see note below).

**CHILD** 1–17 years, 0.5 mL as a single dose; booster dose 0.5 mL, 6–18 months after initial dose; under 1 year, not recommended

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

▲ **With hepatitis B vaccine**

**Ambirix** (GSK) ▼ \( \text{ViATIM} \) (Sanofi Pasteur) \( \text{ViATIM} \)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe = £31.18

*Excipients* include neomycin

**Dose** CHILD 1–15 years, by intramuscular injection (see note below); primary course, 2 doses of 1 mL, the second 6–12 months after initial dose

**Note** Primary course should be completed with Ambirix*<sup>®</sup> (single component vaccines given at appropriate intervals may be used for booster dose), the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**Important** Ambirix™ is not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus

**Twinrix** (GSK) \( \text{ViATIM} \) (Sanofi Pasteur)

**Injection**, inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe (Twinrix<sup>®</sup> Adult) = £27.76, 0.5-mL prefilled syringe (Twinrix<sup>®</sup> Paediatric) = £20.79

*Excipients* include neomycin

**Dose** by intramuscular injection (see note below). ADULT and CHILD over 16 years, primary course of 3 doses of 1 mL (Twinrix<sup>®</sup> Adult), the second 1 month and the third 6 months after the first dose; CHILD 1–15 years, 3 doses of 0.5 mL (Twinrix<sup>®</sup> Paediatric) Accelerated schedule (e.g. for travellers departing within 1 month) ADULT, second dose 7 days after first dose, third dose after further 14 days and a fourth dose 12 months after the first dose

**Note** Primary course should be completed with Twinrix™ (single component vaccines given at appropriate intervals may be used for booster dose), the deltoid region is the preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**Important** Twinrix™ not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular or mucous membrane exposure to hepatitis B virus

▲ **With typhoid vaccine**

**Hepatix** (GSK) \( \text{ViATIM} \) (Sanofi Pasteur)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £32.08

*Excipients* include neomycin

**Dose** by intramuscular injection (see note below). ADULT and CHILD over 15 years, 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 767

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

**Hepatitis B vaccine**

Hepatitis B vaccine contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, groups at high-risk of hepatitis B include:

- parental drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers);
- hepatitis B vaccination started immediately on delivery and hepatitis B immunoglobulin (see p. 771) given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother’s e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products; and other drug misusers who are likely to ‘progress’ to injecting;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients’ tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties; staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods (see p. 774);
families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances (see under individual preparations). Generally, three or four doses are required for primary immunisation; an ‘accelerated schedule’ is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis (see below).

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for common-sense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook Immunisation Against Infectious Disease see p. 746.

Specific hepatitis B immunoglobulin (HBIG) is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection (section 14.5.2).

A combined hepatitis A and hepatitis B vaccine is also available.

HEPATITIS B VACCINE

Indications immunisation against hepatitis B infection

Cautions see section 14.1

Contra-indications see section 14.1

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1

Dose
- See under preparations

Single component

Engerix® B® (GSK) \(\uparrow\)

Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 20 micrograms/mL adsorbed onto aluminium hydroxide, net price 0.5-mL (paediatric) prefilled syringe = £9.67, 1-mL vial = £12.34, 1-mL prefilled syringe = £12.99

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 3 doses of 20 micrograms, the second 1 month and the third 6 months after the first dose; NEONATE (except if born to hepatitis B surface antigen positive mother, see below) and CHILD 1 month–16 years, 3 doses of 10 micrograms

Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose

Within 1 month, ADULT over 18 years, second dose 7 days after first dose, third dose 21 days after first dose, and fourth dose 12 months after first dose

Alternative schedule for CHILD 11–15 years, 2 doses of 20 micrograms, the second dose 6 months after the first dose (this schedule not suitable if high risk of infection between doses or if compliance with second dose uncertain)

NEONATE born to hepatitis B surface antigen-positive mother (see also notes above), 4 doses of 10 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site) the second 1 month, the third 2 months and the fourth 12 months after the first dose

Renal insufficiency (including haemodialysis patients), by intramuscular injection (see note below), ADULT and CHILD over 16 years, 4 doses of 40 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, NEONATE (except if born to hepatitis B surface antigen positive mother, see above) and CHILD 1 month–16 years 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose or accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months and fourth dose 12 months after first dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

Note Deltoit muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates, infants and young children, not to be injected into the buttock (vaccine efficacy reduced)

Fendrix® (GSK) \(\uparrow\)

Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 40 micrograms/mL adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £38.10

Excipients include traces of thiomersal

Dose ADULT and CHILD over 15 years with renal insufficiency (including pre-haemodialysis and haemodialysis patients), by intramuscular injection (see note below) 4 doses of 20 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

Note Deltoit muscle is preferred site of injection, not to be injected into the buttock (vaccine efficacy reduced)

HBVaxPRO® (Sanofi Pasteur) \(\uparrow\)

Injection, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 10 micrograms/mL adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL (5-microgram) prefilled syringe = £8.95, 1-mL (10-microgram) prefilled syringe = £12.20; 40 micrograms/mL, 1-mL (40-microgram) vial = £27.60

Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 3 doses of 10 micrograms, the second 1 month and the third 6 months after the first dose; CHILD under 16 years, 3 doses of 5 micrograms

Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose with fourth dose at 12 months

Booster doses may be required in immunocompromised patients with low antibody concentration

NEONATE born to hepatitis B surface antigen-positive mother (see also notes above), 5 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site), the second 1 month, the third 2 months and the fourth 12 months after the first dose

Chronic haemodialysis patients, by intramuscular injection (see note below) 3 doses of 40 micrograms, the second 1 month and the third 6 months after the first dose; booster doses may be required in those with low antibody concentration

Note Deltoit muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates and infants, not to be injected into the buttock (vaccine efficacy reduced)

With hepatitis A vaccine

See Hepatitis A Vaccine
Human papilloma virus vaccines

Human papilloma virus vaccine is available as a bivalent vaccine (Cervarix®) or a quadrivalent vaccine (Gardasil®). Cervarix® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papilloma virus types 16 and 18. Gardasil® is licensed for use in females for the prevention of cervical cancer, genital warts and pre-cancerous lesions caused by human papilloma virus types 6, 11, 16, and 18. The two vaccines are not interchangeable and one vaccine product should be used for an entire course. However, the Department of Health (November 2008) states that for individuals with previous incomplete vaccination with Gardasil®, who are eligible for HPV vaccination under the national programme, Cervarix® can be used to complete the vaccination course if necessary; the individual must be informed that Cervarix® does not protect against genital warts.

Human papilloma virus vaccine will be most effective if given before sexual activity starts. The first dose is given to females aged 12 to 13 years, the second and third doses are given 1–2 and 6 months after the first dose (see Immunisation schedule, section 14.1); all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed but not repeated, allowing the appropriate interval between the remaining doses. Where there are significant challenges in scheduling vaccinations, another high likelihood that the third dose will not be given, the third dose of Cervarix® can be given 3 months after the second dose. Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papilloma virus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

As the vaccines do not protect against all strains of human papilloma virus, routine cervical screening should continue.

**Influenza vaccines**

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

**Seasonal influenza vaccines**

Seasonal influenza vaccines will not control epidemics—immunisation is recommended only for persons at high risk. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease;
- chronic neurological disease;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including chemotherapy and prolonged corticosteroid treatment);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

**Human papilloma virus vaccines**

**Indications** see notes above and under preparations

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** not known to be harmful, but vaccination should be postponed until completion of pregnancy

**Breast-feeding** see p. 747

**Side-effects** see section 14.1

**Dose**

- See notes above and under preparations

**Note** To avoid confusion, prescribers should specify the brand to be dispensed

Cervarix® (GSK)

**Injection, suspension of virus-like particles of human papilloma virus type 16 (40 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared by recombinant DNA technique using a Baculovirus expression system) in monophosphoryl lipid A adjuvant adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £80.50

**Dose** prevention of pre-malignant genital lesions, cervical cancer and genital warts, by intramuscular injection preferably into deltoid region, ADULT and CHILD 10–25 years, 3 doses of 0.5 mL, the second 1 month and the third 6 months after the first dose

Alternative schedule for ADULT and CHILD 10–25 years, 3 doses of 0.5 mL, the second 1–2 months, and the third 5–12 months after the first dose

Gardasil® (Sanofi Pasteur)

**Injection, suspension of virus-like particles of human papilloma virus type 6 (40 micrograms/mL), type 11 (80 micrograms/mL), type 16 (80 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared from yeast cells by recombinant DNA technique) adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL prefilled syringe = £86.50

**Dose** prevention of pre-malignant genital lesions, cervical cancer and genital warts, by intramuscular injection preferably into deltoid region or higher anterolateral thigh, ADULT and CHILD 9–26 years, 3 doses of 0.5 mL, the second 2 months and the third 6 months after the first dose

Alternative schedule for ADULT and CHILD 9–26 years, 3 doses of 0.5 mL, the second at least 1 month, and the third at least 4 months after the first dose, schedule should be completed within 12 months

**HUMAN PAPILLOMA VIRUS VACCINES**

**Injections**
As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved in patient care. Employers of social care workers should consider similar action.

For people who work in close contact with poultry on a regular basis, influenza immunisation is recommended as a precautionary public health measure. Seasonal human influenza vaccine does not protect against avian influenza, but it reduces the risk of poultry workers contracting both human and avian influenza simultaneously, and therefore also reduces the risk of a new influenza virus emerging.

A single dose of Pandemrix® can be used instead of the seasonal influenza vaccine if supplies of seasonal influenza vaccine are exhausted and cannot be replenished rapidly.

Monovalent influenza A(H1N1)v vaccines

Pandemrix® and Celvapan® are monovalent vaccines licensed against the influenza A(H1N1)v (swine flu) strain.

Pandemrix® is recommended for children aged 6 months–5 years who have not received the monovalent vaccine previously and who are in the risk groups prioritised for seasonal influenza vaccine. Pandemrix® is also recommended for all immunocompromised patients over 6 months of age who have not received the monovalent vaccine previously. Seasonal influenza vaccine should continue to be offered as normal. Pandemrix® can be given at the same time as the first dose of seasonal influenza vaccine; however, Pandemrix® should be given 4 weeks before the seasonal influenza vaccine to immunocompromised patients who only require one dose of seasonal influenza vaccine.

Further information on pandemic influenza, avian influenza and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.hpa.org.uk.

### INFLUENZA VACCINES

**Indications**

Annual immunisation against seasonal influenza; immunisation against influenza during a pandemic

**Cautions**

See section 14.1; interactions: Appendix 1 (vaccines)

**Contra-indications**

See section 14.1; avoid Enzira® or preparations marketed by Pfizer, Wyeth or CSL. Biotherapies in child under 5 years—increased risk of febrile convulsions

**Pregnancy**

Not known to be harmful

**Breast-feeding**

Not known to be harmful

**Side-effects**

See section 14.1; also reported febrile convulsions and transient thrombocytopenia

**Dose**

- Seasonal influenza, by intramuscular injection, ADULT and CHILD over 13 years, 0.5 mL as a single dose; CHILD 6 months–3 years, 0.25–0.5 mL; 3–13 years 0.5 mL; for children 6 months to 13 years who have not received seasonal influenza vaccine previously, repeat after 4–6 weeks
- By intradermal injection, see under Intanza® below
- Influenza A(H1N1)v, see under Celvapan® and Pandemrix® below

---

### Seasonal influenza vaccines for intramuscular use

**Inactivated Influenza Vaccine (Split Virion)**

**Flu**

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £6.29; 0.5-mL prefilled syringe = £6.29

**Exipients** may include neomycin and polymyxin B, and traces of thiomersal

Available from Sanofi Pasteur

**Contra-indications**

Avoid preparations marketed by Pfizer, Wyeth, or CSL. Biotherapies in child under 5 years—increased risk of febrile convulsions

**Inactivated Influenza Vaccine (Surface Antigen)**

**Flu or Flu(adj)**

**Injection**, suspension of propiolactone-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £4.15

**Exipients** may include neomycin and polymyxin B, and traces of thiomersal

Available from Novartis Vaccines

**Note**

Not licensed for children under 4 years

**Agrippal®** (Novartis Vaccines)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £5.85

**Exipients** include polymyxin B

**Begrivic®** (Novartis Vaccines)

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £5.85

**Exipients** include polymyxin B

**Enzira®** (Pfizer)

**Injection**, suspension of inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £6.33

**Exipients** include neomycin and polymyxin B

**Contra-indications**

Child under 5 years—increased risk of febrile convulsions

**Fluarix®** (GSK)

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £6.33

**Exipients** include gentamicin

**Fluvirin®** (Novartis Vaccines)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £5.39

**Exipients** include gentamicin

**Imuvac®** (Abbott)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £6.59

**Exipients** include gentamicin

**Influvac Sub-unit®** (Abbott)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £5.55

**Exipients** include gentamicin

**Mastalvu®** (MASTA)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £6.50

**Exipients** include gentamicin
Virolflu® (Cruccell) Injection, suspension of inactivated influenza virus (surface antigen, virosome, grown in fertilised hens’ eggs), net price 0.5 mL prefilled syringe = £6.33 Excipients include neomycin and polysorbate 8

Seasonal influenza vaccine for intradermal use

Intanza® (Sanofi Pasteur) Injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price, prefilled syringe, 9 micrograms (0.1 mL) = £9.05; prefilled syringe, 15 micrograms (0.1 mL) = £9.05 Excipients include neomycin

Dose by intradermal injection into deltoid region

Monovalent influenza A(H1N1)fluenza vaccine

Celvapan® (Baxter) Injection, suspension of formaldehyde-inactivated influenza A(H1N1) virus (whole virion, grown in vero cells), 15 micrograms/mL, 5-mL multidose vial contains 10 doses of 0.5 mL

Dose prevention of influenza A(H1N1) by intramuscular injection, ADULT over 18 years, 9 micrograms as a single dose, ADULT over 60 years, 15 micrograms as a single dose

Note Celvapan® is not interchangeable with Pandemrix®

Pandemrix® (GSK) Injection, suspension of inactivated influenza A(H1N1) virus (split virion, grown in fertilised hens’ eggs) 7.5 micrograms/mL when mixed with emulsion of adjuvant, 5 mL of mixed multidose vial contains 10 doses of 0.5 mL

Excipients include gentamicin and thiomersal

Dose prevention of influenza A(H1N1) by intramuscular injection, ADULT and CHILD over 6 months, 2 doses each of 0.5 mL separated by an interval of at least 3 weeks

Note Pandemrix® is not interchangeable with Celvapan®

Japanese encephalitis vaccine

Japanese encephalitis vaccine is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnac.org)

Measles vaccine

Measles vaccine has been replaced by a combined live measles, mumps, and rubella vaccine (MMR vaccine). MMR vaccine may be used in the control of outbreaks of measles (see under MMR Vaccine).

Single antigen vaccine

No longer available in the UK

Combined vaccines

See MMR vaccine

Measles, Mumps and Rubella (MMR) vaccine

A combined live measles, mumps, and rubella vaccine (MMR vaccine) aims to eliminate measles, mumps, and rubella (and congenital rubella syndrome). Every child should receive two doses of MMR vaccine by entry to primary school, unless there is a valid contra-indication (see under MMR Vaccine).

When protection against measles is required urgently (e.g. during a measles outbreak), the second dose of MMR vaccine can be given 1 month after the first dose; if the second dose is given before 18 months of age, children should still receive the routine dose before starting school at 3–5 years of age.

Children presenting for pre-school booster who have not received the first dose of MMR vaccine should be given a dose of MMR vaccine followed 3 months later by a second dose. At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In a young adult who has received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of MMR vaccine are required, the second dose should be given one month after initial dose.

Note Japanese encephalitis vaccine not prescribable on the NHS; health authorities may investigate circumstances under which vaccine prescribed
MMR vaccine should be used to protect against rubella in **seronegative women of child-bearing age** (see Immunisation Schedule, section 14.1); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. MMR vaccine may also be offered to previously **unimmunised and seronegative post-purum women**—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

**Contacts**  MMR vaccine may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection; these children should still receive routine MMR vaccinations at the recommended ages. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as they who have a history of recent severe illness) can be given normal immunoglobulin (section 14.5.1) after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

MMR vaccine is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (for advice on HIV see section 14.1). If they have been exposed to measles infection they should be given normal immunoglobulin (section 14.5.1).

**Travel** Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive MMR vaccine. Children immunised before 12 months of age should still receive two doses of MMR at the recommended ages. If one dose of MMR has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3–5 years should still be given.

**Side-effects** See section 14.1; also malaise, fever, or a rash can occur after the first dose of MMR vaccine, most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Febrile seizures occur rarely 6 to 11 days after MMR vaccination; the incidence of febrile seizures is lower than that following measles infection. Parotid swelling occurs occasionally, usually in the third week, and rarely, arthropyathy 2 to 3 weeks after immunisation. Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first dose.

Hypersensitivity to egg—there is increasing evidence that MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg (dislike of egg or refusal to eat eggs is not a contra-indication). For children with a confirmed anaphylactic reaction to egg-containing food, MMR vaccine should be administered in a hospital setting.

Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR.

Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

**Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism.** The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from: [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation)

---

**MEASLES, MUMPS AND RUBELLA VACCINE, LIVE**

**Indications** immunisation against measles, mumps, and rubella

**Cautions** see section 14.1; also, after immunoglobulin administration or blood transfusion, leave an interval of at least 3 months before MMR immunisation as antibody response to measles component may be reduced—see also p. 772; **Interactions:** Appendix 1 (vaccines)

**Hypersensitivity to egg** There is increasing evidence that MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg (dislike of egg or refusal to eat egg is not a contra-indication). For children with a confirmed anaphylactic reaction to egg-containing food, MMR vaccine may be administered in hospital setting

**Contra-indications** see section 14.1

**Pregnancy** avoid pregnancy for at least 1 month after vaccination; see also, p. 747

**Breast-feeding** see p. 747

**Side-effects** see section 14.1 and notes above; also **less commonly** sleep disturbances, unusual crying in infants; also reported peripheral and optic neuritis

**Dose**

- By intramuscular or deep subcutaneous injection, **ADULT** and **CHILD** over 9 months (but see also notes above), primary immunisation, 2 doses each of 0.5 mL, see Immunisation Schedule, section 14.1, p. 748; see also notes above for use in outbreaks, for contacts of cases, and for travel
Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. Meningococcal group C conjugate vaccine protects only against infection by serogroup C. The risk of meningococcal disease declines with age—in immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serotypes A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal A, C, W135, and Y conjugate vaccine is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serotype C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal.

**Childhood immunisation** Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 2 doses given at 3 months and 4 months of age; a booster should be given at 12–13 months of age, usually combined with haemophilus influenzae type b vaccine (see Immunisation Schedule, section 14.1, p. 748).

It is recommended that meningococcal group C conjugate vaccine be given to anyone aged under 25 years who has not been vaccinated previously with this vaccine; those over 1 year receive a single dose. A single dose of meningococcal group C conjugate vaccine is also recommended for unimmunised individuals attending university, irrespective of age.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Asplenia or splenic dysfunction Children under 1 year should be vaccinated according to the Immunisation Schedule (section 14.1), but should receive 2 doses of meningococcal A, C, W135, and Y conjugate vaccine at 3 months and 4 months of age instead of the meningococcal group C conjugate vaccine; these children should also receive one dose of meningococcal group C conjugate vaccine (combined with haemophilus influenzae type b vaccine) at 12 months of age, followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. Unimmunised adults and children over 1 year should be given 1 dose of meningococcal group C conjugate vaccine (preferably combined with haemophilus influenzae type b vaccine) followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. Immunised adults and children who develop splenic dysfunction should be given 1 additional dose of meningococcal group C conjugate vaccine (preferably combined with haemophilus influenzae type b vaccine) followed 2 months later by a single dose of meningococcal A, C, W135, and Y conjugate vaccine.

**Complement deficiency** Unimmunised adults and children over 1 year of age with complement deficiency should be given 1 dose of meningococcal group C conjugate vaccine (preferably combined with haemophilus influenzae type b vaccine) followed 2 months later by 1 dose of meningococcal A, C, W135 and Y conjugate vaccine. Immunised adults and children, who subsequently become complement deficient, should be given 1 dose of meningococcal A, C, W135 and Y conjugate vaccine at least 2 months after the last dose of meningococcal group C conjugate vaccine.

**Travel** Individuals travelling to countries of risk (see below) should be immunised with meningococcal A, C, W135, and Y conjugate vaccine, even if they have previously received meningitis C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (A, C, W135, and Y) vaccine. Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org).

Proof of vaccination with the tetravalent (A, C, W135, and Y) meningococcal vaccine is required for those travelling to Saudi Arabia during the Haj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

**Contacts** For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.hpa.org.uk. See Table 2, section 5.1 for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.
Meningococcal Vaccines

**Indications**  
Immunisation against *Neisseria meningitidis*

**Cautions**  
see section 14.1

**Contra-indications**  
see section 14.1

**Pregnancy**  
see p. 747

**Breast-feeding**  
see p. 747

**Side-effects**  
se on section 14.1; also see p. 747

**Breast-feeding**  
see section 14.1

**Contra-indications**  
see section 14.1

**Cautions**  
see section 14.1

**Immunisation against**

14.4 Vaccines and antisera BNF 61

- **Meningococcal polysaccharide A, C, W135 and Y vaccine**
  - **ACW Yax** (GSK) \(\textsuperscript{\copyright}\) \(\textsuperscript{\textregistered}\)
  - Injection, powder for reconstitution, capillary polysaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y, net price single-dose vial (with syringe containing diluent) = £16.73
  - Dose: by deep subcutaneous injection, ADULT and CHILD over 5 years 0.5 mL as a single dose; booster dose for those at continued risk, 0.5 mL 5 years after initial dose

**Mumps vaccine**

- **Single antigen vaccine**  
No longer available in the UK

- **Combined vaccines**  
See MMR Vaccine

**Pertussis vaccine**

**Pertussis vaccine** is given as a combination preparation containing other vaccines (see *Diphtheria containing Vaccines*). Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule, section 14.1), given at intervals of 1 month from the age of 2 months. A booster dose of an acellular pertussis-containing vaccine should be given 3 years after the primary course.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not currently recommended in individuals over 10 years of age.

**Cautions**  
Section 14.1

**Contra-indications**  
Section 14.1

**Pregnancy**  
See p. 747

**Breast-feeding**  
See p. 747

**Side-effects**  
See also section 14.1. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses (see below).
The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

**Combined vaccines**

Combined vaccines, see under Diphtheria-containing vaccines

### Pneumococcal vaccines

Pneumococcal vaccines protect against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. Pneumococcal polysaccharide vaccine contains purified polysaccharide from 23 capsular types of pneumococci, whereas pneumococcal polysaccharide conjugate vaccine contains polysaccharide from either 10 capsular types (*Streptococcus pneumoniae*) or 13 capsular types (*Prevenar 13*®) and the polysaccharide is conjugated to protein.

The 13-valent conjugate vaccine (*Prevenar 13*®) is used in the childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule, section 14.1).

Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur;
- child under 5 years with a history of invasive pneumococcal disease.

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, and chemotherapy; patients should be given advice about increased risk of pneumococcal infection. Prophylactic antibacterial therapy against pneumococcal infection (Table 2, section 5.1) should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

**Choice of vaccine**

Children under 2 years at increased risk of pneumococcal infection (see list above) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday (see below). Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

**Revaccination**

In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

**PNEUMOCOCCAL VACCINE**

**Indications**

Immunisation against pneumococcal infection

**Cautions**

See section 14.1

**Contra-indications**

See section 14.1

**Pregnancy**

See p. 747

**Breast-feeding**

See p. 747

**Side-effects**

See section 14.1; also Revaccination, above

**Dose**

- See under preparations

**Pneumococcal polysaccharide vaccine**

**Pneumovax® II** (Sanofi Pasteur)⃞

Injection, polysaccharide from each of 23 capsular types of pneumococcus, net price 0.5 mL vial = £8.32

**Dose**

By intramuscular or subcutaneous injection, ADULT and CHILD over 2 years, 0.5 mL, revaccination, see notes above.
14 Immunological products and vaccines

Pneumococcal polysaccharide conjugate vaccine (adsorbed)

Prevenar 13® (Wyeth) ▼ ▼

Injection, polysaccharide from each of 13 capsular types of pneumococcus (conjugated to carrier protein) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £49.10

Dose by intramuscular injection, CHILD 2 months–5 years, 0.5 mL (see notes above and Immunisation schedule, section 14.1)

Note Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants.

The dose in the BNF may differ from that in product literature. Available as part of childhood immunisation schedule from Movano.

Synflorix® (GSK) ▼ ▼

Injection, polysaccharide from each of 10 capsular types of pneumococcus (conjugated to carrier proteins) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £27.60

Dose by intramuscular injection, CHILD 6 weeks–2 years, 0.5 mL (see notes above and Immunisation schedule, section 14.1)

Note Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants.

Polio vaccines

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccine, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule, section 14.1). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1).

Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Preparations containing inactivated poliomyelitis vaccine can be used to complete an immunisation course initiated with the live (oral) poliomyelitis vaccine. Live (oral) poliomyelitis vaccine is available only for use during outbreaks. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccine removes the risk of vaccine-associated paralytic polio altogether.

Travel Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccine. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre (www.nathnac.org).

Rabies vaccine

Rabies vaccine contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org)
Pre-exposure prophylaxis, see section 14.1; also reported paresis

Side-effects see p. 747

Breast-feeding

Pregnancy

Contra-indications see section 14.1

Indications immunisation against rabies

Cautions see also Post-exposure Management in notes above

Pregnancy see p. 747

Breast-feeding see p. 747

Side-effects see section 14.1; also reported paresis

Dose

Post-exposure prophylaxis, by intramuscular injection in deltoid region or anterolateral thigh in infants, 1 mL (see notes above)

Post-exposure prophylaxis, by intramuscular injection in deltoid region or anterolateral thigh in infants, 1 mL (see notes above)

Rabies Vaccine

Indications immunisation against rabies

Cautions see section 14.1; also diarrhoea or vomiting (postpone vaccination); immunosuppressed close contacts (see notes above); interactions: Appendix 1 (vaccines)

Contra-indications see section 14.1; also predisposition to, or history of, intussusception

Side-effects see section 14.1

Dose

- By mouth, CHILD over 6 weeks, 2 doses of 1.5 mL, separated by an interval of at least 4 weeks; course should be completed before 24 weeks of age (preferably before 16 weeks)

Rotarix® (GSK) ▼ (Novartis Vaccines)

Oral suspension, live attenuated rotavirus (RIX4414 strain), net price 1.5 mL prefilled oral syringe = £41.38

Rabies Vaccine

Rhulib® (Novartis Vaccines) ▼

Injection, powder for reconstitution, freeze-dried inactivated Flury LEP rabies virus strain cultivated in chick embryo cells, net price single-dose vial = £28.90

Excipients include neomycin

Rotavirus vaccine

Rotavirus vaccine a live, oral vaccine is licensed for immunisation of infants over 6 weeks of age for protection against gastro-enteritis caused by rotavirus infection. The vaccine is not included in the childhood immunisation schedule.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; the vaccine should be used with caution in those with immunosuppressed close contacts. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

14.4 Vaccines and antisera

Rubella vaccine

A combined measles, mumps and rubella vaccine (MMR vaccine) aims to eliminate rubella (German measles) and congenital rubella syndrome. MMR vaccine is used for childhood vaccination as well as for vaccinating adults (including women of child-bearing age) who do

14Immunological products and vaccines

and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at continued risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

Post-exposure management

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the Health Protection Agency Virus Reference Department, Colindale, London (tel. (020) 8200 4400) or the Centre for Infections (tel. (020) 8200 6868), in Scotland from Health Protection Scotland (tel. (0141) 300 1100), in Northern Ireland from the Public Health Laboratory, Belfast City Hospital (tel. (028) 9032 9241).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine, given on day 0 and day 3, are likely to be sufficient. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and 30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin (section 14.5.2) is given on day 0. The immunisation course can be discontinued if it is proved that the individual was not at risk.

14.4 Vaccines and antisera

Rubella vaccine

A combined measles, mumps and rubella vaccine (MMR vaccine) aims to eliminate rubella (German measles) and congenital rubella syndrome. MMR vaccine is used for childhood vaccination as well as for vaccinating adults (including women of child-bearing age) who do
Immunological products and vaccines

14 Immunological products and vaccines
www.dh.gov.uk

See also section 14.1. When an individual does not have immunity against rubella (see MMR vaccine, p. 759)

- Single antigen vaccine
  No longer available in the UK; the combined live measles, mumps and rubella vaccine is a suitable alternative

- Combined vaccines
  see MMR vaccine

Smallpox vaccine
Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Health Protection Agency (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidance for smallpox response and management in the post-eradication era should be consulted at www.dh.gov.uk

Tetanus vaccines
Tetanus vaccine contains a cell-free purified toxin of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine (see Diphtheria-containing Vaccines), with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1). The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

Cautions
See also section 14.1. When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Travel recommendations see section 14.6.

Contra-indications
See section 14.1.

Pregnancy
See p. 747.

Breast-feeding
See p. 747.

Side effects
See section 14.1.

Wounds
Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For clean wounds: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need).

- For tetanus-prone wounds: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin (section 14.5.2) given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

Combined vaccines
See Diphtheria-containing Vaccines

Tick-borne encephalitis vaccine
Tick-borne encephalitis vaccine contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel, section 14.6). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.
**TICK-BORNE ENCEPHALITIS VACCINE, INACTIVATED**

**Indications** Immunisation against tick-borne encephalitis

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 747

**Breast-feeding** see p. 747

**Side-effects** see section 14.1

**Dose**
- Initial immunisation, by intramuscular injection in deltoid region or anterolateral thigh in infants, ADULT and CHILD over 16 years, 3 doses each of 0.5 mL, second dose after 1–3 months and third dose after further 5–12 months; CHILD 1–16 years 3 doses of 0.25 mL, second dose after 1–3 months and third dose after further 5–12 months; ELDERLY over 60 years and immunocompromised (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved.

**Note** To achieve more rapid protection, second dose may be given 14 days after first dose

- Booster doses, give first dose within 3 years after initial course completed, then every 3–5 years

**TicoVac®** (MASTA) (Crucell)

**Injection**, suspension, formaldehyde-inactivated Neudorf tick-borne encephalitis virus strain (cultivated in chick embryo cells) adsorbed onto hydrated aluminium hydroxide, net price 0.25–mL prefilled syringe (TicoVac Junior®) = £28.00, 0.5-mL prefilled syringe = £32.00

**Excipients** include gentamicin and neomycin

**Typhoid vaccines**

Typhoid vaccine is available as Vi capsular polysaccharide vaccine and live attenuated Salmonella typhi for oral use.

Typhoid immunisation is advised for
- travellers to areas where typhoid is endemic, especially if staying with or visiting local people
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely
- laboratory personnel who, in the course of their work, may be exposed to Salmonella typhi

Typhoid vaccination is not a substitute for scrupulous personal hygiene (see p. 774).

Capsular polysaccharide typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Booster doses are needed every 3 years on continued exposure.

Oral typhoid vaccine is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeat-
edly) exposed to Salmonella typhi, but occasional travellers require further courses at intervals of 1 year.

**Interactions** Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:
- Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- Mefloquine should be avoided for at least 12 hours before or after oral typhoid; vaccination with oral typhoid should preferably be completed at least 3 days before the first dose of mefloquine;
- For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

**TYPHOID VACCINE**

**Indications** Immunisation against typhoid fever

**Cautions** section 14.1; interactions: see above and Appendix 1 (vaccines)

**Contra-indications** section 14.1; also for oral vaccine, acute gastro-intestinal illness

**Pregnancy** see p. 747

**Breast-feeding** see p. 747

**Side-effects** section 14.1

**Dose**
- See under preparations

**Typhoid polysaccharide vaccine for injection**

**Typhexir®** (GSK) (Sanofi Pasteur)

**Injection**, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of Salmonella typhi, net price 0.5-mL prefilled syringe = £9.93

**Dose** by intramuscular injection, 0.5 mL at least 2 weeks before potential exposure to typhoid infection, CHILD under 2 years (see notes above)

**Tychim Vi®** (Sanofi Pasteur) (MVA)

**Injection**, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of formaldehyde-inactivated Salmonella typhi, net price 0.5-mL prefilled syringe = £9.00

**Dose** by intramuscular injection, 0.5 mL at least 2 weeks before potential exposure to typhoid infection CHILD under 2 years (see notes above)

**Polysaccharide vaccine with hepatitis A vaccine**

See Hepatitis A Vaccine

**Typhoid vaccine, live (oral)**

**Vivotif®** (Crucell)

**Capsules, e/c, live attenuated Salmonella typhi** (Ty21a), net price 3-cap pack = £14.77. Label: 23, 25, counselling, administration

**Dose** ADULT and CHILD over 6 years, 1 capsule on days 1, 3, and 5

**Counselling** Swallow as soon as possible after placing in mouth with a cold or lukewarm drink; it is important to store capsules in a refrigerator

**Varicella–zoster vaccine**

Varicella–zoster vaccine (live) is licensed for immunisation against varicella in seronegative individuals. It is not recommended for routine use in children but can be
given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends varicella–zoster vaccine for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

Varicella–zoster immunoglobulin is used to protect susceptible individuals at increased risk of varicella infection, see p. 772.

### VARICELLA-ZOSTER VACCINE

**Indications** immunisation against varicella infection (see notes above)

**Cautions** see section 14.1; also post-vaccination close-contact with susceptible individuals (see notes above);

**Interactions:** Appendix 1 (vaccines)

**Contra-indications** see section 14.1

**Pregnancy** avoid pregnancy for 3 months after vaccination; see also p. 747

**Breast-feeding** see p. 747

**Side-effects** see section 14.1; also varicella-like rash; rarely thrombocytopenia

**Dose**
- See under preparations

#### Varilrix® (GSK) \( \uparrow \uparrow \)

**Injection**, powder for reconstitution, live attenuated varicella–zoster virus (Oka strain) propagated in human diploid cells, net price 0.5 mL vial (with diluent) = £27.31

**Excipients** include neomycin

**Dose** by subcutaneous injection preferably into deltoid region, ADULT and CHILD over 1 year (see notes above); 2 doses of 0.5 mL, separated by an interval of at least 6 weeks (minimum 4 weeks)

#### Varivax® (Sanofi Pasteur) \( \uparrow \uparrow \)

**Injection** powder for reconstitution, live attenuated varicella-zoster virus (Oka/Merck strain) propagated in human diploid cells, net price 0.5 mL vial (with diluent) = £30.28

**Excipients** include gelatin and neomycin

**Dose** by intramuscular or subcutaneous injection into deltoid region (or higher anterolateral thigh in children); ADULT and CHILD over 13 years (see notes above); 2 doses of 0.5 mL, separated by 4–8 weeks; CHILD 1–13 years (see notes above) 2 doses of 0.5 mL, separated by an interval of at least 4 weeks (two doses separated by 12 weeks in children with asymptomatic HIV infection)

### YELLOW FEVER VACCINE, LIVE

**Indications** immunisation against yellow fever

**Cautions** see section 14.1; also individuals over 60 years—greater risk of vaccine-associated adverse effects, see notes above; **interactions:** Appendix 1 (vaccines)

**Contra-indications** see section 14.1 and notes above; also children under 6 months; history of thymus dysfunction

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see section 14.1; also reported neurotropic disease and viscerotropic disease (see notes above)

**Dose**
- By deep subcutaneous injection, ADULT and CHILD over 9 months, 0.5 mL (see also notes above)

#### Yellow Fever Vaccine, Live \( \downarrow \downarrow \)

**Injection**, powder for reconstitution, live, attenuated 17D-204 strain of yellow fever virus, cultivated in chick embryos; single dose vial with syringe containing 0.5 mL diluent

Available (only to designated Yellow Fever Vaccination centres) as Stamaril®
14.5 Immunoglobulins

14.5.1 Normal immunoglobulin

Human normal immunoglobulin (‘HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

Uses Normal immunoglobulin (containing 10%–18%) is administered by intramuscular injection for the protection of susceptible contacts against hepatitis A virus (infectious hepatitis), measles and, to a lesser extent, rubella. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for intravenous administration is used as replacement therapy for patients with congenital agammaglobulinemia and hypogammaglobulinemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulins and alternative therapies for certain conditions, consult Clinical Guidelines for Immunoglobulin Use (www.dh.gov.uk).

Hepatitis A Hepatitis A vaccine is preferred for individuals at risk of infection (see p. 754) including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

Measles Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Children and adults with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of
measles or with a person associated with a local outbreak:

- non-immune pregnant women;
- infants under 9 months.

Further advice should be sought from the Centre for Infections, Health Protection Agency (tel. (020) 8200 6888).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given MMR vaccine (section 14.4) for prophylaxis following exposure to measles.

Rubella Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intrauterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see MMR vaccine (p. 759).

### Normal Immunoglobulin

#### Indications
- See notes above

#### Cautions
- Hypo- or agammaglobulinaemia with or without IgA deficiency; interference with live virus vaccines—see p. 769

#### Contra-indications
- Patients with selective IgA deficiency who have known antibody against IgA

#### Renal Impairment
- Monitor for acute renal failure; consider discontinuation if renal function deteriorates.

#### Side-effects
- Nausea, diarrhoea, chills, fever, headache, dizziness, arthralgia, myalgia, muscle spasms, low back pain; rarely hypotension, anaphylaxis, cutaneous reactions, urticaria, pruritus, abdominal pain and distension, blood pressure fluctuations, haemolytic anaemia, thromboembolic events including myocardial infarction, stroke, pulmonary embolism, and deep vein thrombosis

**Note** Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

#### Dose
- See under preparations

**Note** Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.
14.5.2 Disease-specific immunoglobulins

Kiovig® (Baxter)  
Intravenous infusion, human normal immunoglobulin (protein 10%), net price 1 g (10 mL) = £49.00, 2.5 g (25 mL) = £122.50, 5 g (50 mL) = £245.00, 10 g (100 mL) = £490.00, 20 g (200 mL) = £980.00.

Note: Use Glucose 5% intravenous infusion, if dilution prior to administration is required.

Privigen® (CSL Behring)  
Intravenous infusion, human normal immunoglobulin (protein 10%), net price 2.5 g (25 mL) = £135.00, 5 g (50 mL) = £270.00, 10 g (100 mL) = £540.00, 20 g (200 mL) = £1080.00.

Note: Contains L-proline, contra-indicated in patients with hyperprolenaemia.

Vigam® (BPL)  
Intravenous infusion, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £95.00, 5 g (100 mL) = £190.00, 10 g (200 mL) = £380.00.

Note: Contains sucrose (see Renal impairment, above).

14.5.2 Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.hpa.org.uk).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin, section 14.5.1 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor MMR vaccine is effective as post-exposure prophylaxis.

Hepatitis B

Disease-specific hepatitis B immunoglobulin (‘HBIG’) is available for use in association with hepatitis B vaccine for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see Hepatitis B Vaccine, p. 755). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given in different sites.

An intravenous and subcutaneous preparation of hepatitis B-specific immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

Hepatitis B Immunoglobulin

Indications  prophylaxis against hepatitis B infection

Cautions  IgA deficiency; interference with live virus vaccines see under Normal Immunoglobulin, p. 769.

Side-effects  injection site reactions; less frequently, buccal ulceration, glossitis, abdominal pain, chest pain, dyspnoea, anaphylaxis, tremor, dizziness, headache, arthralgia; for side-effects associated with intravenous immunoglobulin, see section 14.5.1.

Dose  ● See under preparations and see also notes above.

For intramuscular use

Hepatitis B Immunoglobulin  
Injection, hepatitis B-specific immunoglobulin, 100 units/mL. Vials containing 200 units or 500 units, available from selected Health Protection Agency and NHS laboratories (except for Transplant Centres, see p. 769), also available from BPL.

Dose: by intramuscular injection (as soon as possible after exposure), ideally within 12–48 hours, but no later than 7 days after exposure.

ADULT and CHILD over 10 years 500 units; CHILD under 5 years 200 units, 5–9 years 300 units, NEONATE 200 units.

Prevention of transmitted infection at birth, NEONATE 200 units as soon as possible after birth; for full details consult Immunisation against Infectious Disease (www.dh.gov.uk).

For intravenous use

Note: Hepatitis B immunoglobulin for intravenous use is available from BPL on a named-patient basis.

Hepatect®CP (Biotest UK)  
Intravenous infusion, hepatitis B-specific immunoglobulin 50 units/mL, net price 500 units (10 mL) = £300.00, 2000 units (40 mL) = £1100.00.

Dose: by intravenous infusion, after exposure to hepatitis B virus-contaminated material—consult product literature.

Prevention of transmitted infection at birth—consult product literature.

Prevention of hepatitis B in haemodialysed patients, prophylaxis against re-infection of transplanted liver—consult product literature.

For subcutaneous use

Zutectra® (Biotest UK)  
Injection, hepatitis B-specific immunoglobulin, 500 units/mL, net price 5 x 1 mL prefilled syringes = £1500.00.

Dose: prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients starting 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin, by subcutaneous injection, ADULT body-weight under 75 kg 580 units once weekly, increased if necessary up to 1000 units once weekly; body-weight over 75 kg 1000 units once weekly.

Rabies

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine should also be given intramuscularly at a different site (for details see Rabies vaccine p. 764).

Rabies Immunoglobulin

Indications  post-exposure prophylaxis against rabies infection

Cautions  IgA deficiency; interference with live virus vaccines—see p. 769 under Normal Immunoglobulin

Side-effects  injection site swelling and pain; very rarely anaphylaxis; buccal ulceration, glossitis, chest tightness, dyspnoea, tremor, dizziness, arthralgia, and facial oedema also reported.

Dose  ● See under preparation.
### 14.5.3 Anti-D (Rh0) immunoglobulin

**Indications**  
Prophylaxis against Rhesus-negative haemolytic disease of the newborn.

**Cautions**  
IgA deficiency; interference with live virus vaccines—see p. 769

**Side-effects**  
Injection site swelling and pain; rarely anaphylaxis

**Dose**  

- **Neonate**: 10 units/kg given as a single dose when significant feto-maternal haemorrhage occurs in Rhesus-negative neonates.
- **Infant**: 10 units/kg given as a single dose when significant feto-maternal haemorrhage occurs in Rhesus-negative neonates.
- **Child** 1–9 years: 20 units/kg given as a single dose when significant feto-maternal haemorrhage occurs in Rhesus-negative neonates.
- **Child** 10–14 years: 25 units/kg given as a single dose when significant feto-maternal haemorrhage occurs in Rhesus-negative neonates.
- **Child** over 14 years: 50 units/kg given as a single dose when significant feto-maternal haemorrhage occurs in Rhesus-negative neonates.

**Note**  
May be difficult to obtain.
sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

**NICE guidance**

Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008)

Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.

Note

MMR vaccine may be given in the postpartum period with anti-D (Rh) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

**ANTI-D (Rh) IMMUNOGLOBULIN**

**Indications** see notes above

**Cautions** immunoglobulin A deficiency; possible interference with live virus vaccines, see below p. 769, but see notes above about administration with MMR vaccine

**Contra-indications** treatment of idiopathic thrombocytopenia purpura in rhesus negative or splenectomised patients

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, hypotension, hypertension, headache, fever, malaise, asthenia, drowsiness, dizziness, back pain, arthralgia, myalgia; pruritus, rash, sweating, injection site pain; rarely tachycardia, anaphylaxis, dyspnoea, hypotension, and urticaria; (for side-effects associated with intravenous immunoglobulins, see section 14.5.1

**Dose**

● See preparations below

**Anti-D (Rh) Immunoglobulin**

Injection, anti-D (Rh) immunoglobulin, net price 250-unit vial = £19.00, 500-unit vial = £27.00, 1500-unit vial = £58.00, 2500-unit vial = £94.40

Dose by deep intramuscular injection, to rhesus-negative woman for prevention of Rh(D) sensitisation:

Following birth of rhesus-positive infant, 500 units immediately or within 72 hours; for large transplacental blood loss, 50–125 units per mL of fetal red cells

Antenatal prophylaxis, 1000–1500 units given at weeks 28 and 34 of pregnancy. If infant rhesus-positive, further dose is needed immediately or within 72 hours of delivery

Following abortion, ectopic pregnancy or hydatidiform mole up to 12 weeks’ gestation, 600–750 units (after 12 weeks, 1250–1650 units) immediately or within 72 hours

Following amniocentesis or chorionic villous sampling, 1250–1500 units immediately or within 72 hours

Following Rh (D) incompatible blood or red cell transfusion, 1250 units per 10 mL of transfused rhesus-positive red cells immediately or within 72 hours

**Note** Subcutaneous route recommended for patients with bleeding disorders.

**Partobulin SDF®** (Baxter) Injection, anti-D (Rh) immunoglobulin 1250 units/mL (250 micrograms/mL), net price 1-mL prefilled syringe = £35.00

Dose by intramuscular injection, to rhesus-negative woman for prevention of Rh (D) sensitisation:

Following birth of rhesus-positive infant, 1000–1650 units immediately or within 72 hours; for large transplacental blood loss, 50–125 units per mL of fetal red cells

Antenatal prophylaxis, 1000–1500 units given at weeks 28 and 34 of pregnancy. If infant rhesus-positive, further dose is needed immediately or within 72 hours of delivery

Following abortion, ectopic pregnancy or hydatidiform mole up to 12 weeks’ gestation, 600–750 units (after 12 weeks, 1250–1650 units) immediately or within 72 hours

Following amniocentesis or chorionic villous sampling, 1250–1500 units immediately or within 72 hours

Following Rh (D) incompatible blood or red cell transfusion, 1250 units per 10 mL of transfused rhesus-positive red cells immediately or within 72 hours

**Note** Subcutaneous route recommended for patients with bleeding disorders.

1. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients.
posing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100,000; it should preferably be given 3 months or more before departure.

Monovalent influenza A(H1N1) vaccine (see p. 758) can be offered to travellers visiting countries in the southern hemisphere during their influenza season.

Yellow fever immunisation (see p. 768) is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk). Immunisation against meningococcal meningitis is recommended for a number of areas of the world (for details, see p. 761).

Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine (see p. 754) is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised (see p. 769). Special care must also be taken with food hygiene (see below).

Hepatitis B vaccine (see p. 755) is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against rabies (see p. 764) is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention. Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine (see p. 752), even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine (see p. 767) is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions (see below). There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine (see p. 751) should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene (see below).

Advice on diphtheria (see p. 752), on Japanese encephalitis (see p. 759) and on tick-borne encephalitis (see p. 766) is included in Health Information for Overseas Travel, see below.

Food hygiene In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

# Anaesthesia

## General anaesthesia

15.1.1 Intravenous anaesthetics
15.1.2 Inhalational anaesthetics
15.1.3 Antimuscarinic drugs
15.1.4 Sedative and analgesic peri-operative drugs
15.1.5 Neuromuscular blocking drugs
15.1.6 Drugs for reversal of neuromuscular blockade
15.1.7 Antagonists for central and respiratory depression
15.1.8 Drugs for malignant hyperthermia

### Important

The drugs in section 15.1 should be used by experienced personnel only and when resuscitation equipment is available.

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation (section 15.1.2) or with an intravenously administered drug (section 15.1.1); anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics (section 15.1.4), usually short-acting opioids, are also used. The use of neuromuscular blocking drugs (section 15.1.5) necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases (section 15.1.6) can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists (section 15.1.7) can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic (section 15.2) can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

### Surgery and long-term medication

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use (section 6.3.2) may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate post-operative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).
Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists below), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or anti-thyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. For general advice on surgery in diabetic patients see section 6.1.1, p. 421.

Patients taking antplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antplatelet or the anticoagulant drug should be stopped or replaced with unfractionated or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives (see Surgery, section 7.3.1 for details); for advice on hormone replacement therapy, see section 6.4.1.1. If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. MAOIs can have important interactions with some drugs used during surgery, such as pethidine (for interactions of MAOIs, see Appendix 1, MAOIs). Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery.

**Anaesthesia and driving**

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving afterwards. For intravenous benzodiazepines and for a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**Prophylaxis of acid aspiration**

Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastrooesophageal reflux disease and in circumstances where gastric emptying may be delayed.

An H₂-receptor antagonist (section 1.3.1) or a proton pump inhibitor (section 1.3.5), such as omeprazole, can be used before surgery to increase the pH and reduce the volume of gastric fluid. They do not affect the pH of fluid already in the stomach and this limits their value in emergency procedures; oral H₂-receptor antagonists can be given 1–2 hours before the procedure, but omeprazole must be given at least 12 hours earlier. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; ‘clear’ (non-particulate) antacids such as sodium citrate are preferred. Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

**Gas cylinders**

Each gas cylinder bears a label with the name of the gas contained in the cylinder. The name or chemical symbol of the gas appears on the shoulder of the cylinder and is also clearly and indelibly stamped on the cylinder valve. The colours on the valve end of the cylinder extend down to the shoulder; in the case of mixed gases the colours for the individual gases are applied in four segments, two for each colour.

Gas cylinders should be stored in a cool well-ventilated room, free from flammable materials.

**Anaesthesia, sedation, and resuscitation in dental practice**

For details see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care* report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Conscious Sedation in the Provision of Dental Care*, report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003. Both documents are available at [www.dh.gov.uk](http://www.dh.gov.uk).

Guidance is also included in *Standards for Dental Professionals*, London, General Dental Council, May 2005 (and as amended subsequently), and *Conscious Sedation in Dentistry: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, May 2006.

**15.1 Intravenous anaesthetics**

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time and can cause apnoea and hypotension, and so adequate resuscitative facilities must be available. They are contra-indicated if the anaesthetist is not confident of being able to maintain the airway (e.g. in the presence of a tumour in the pharynx or larynx). Extreme care is required in surgery of the mouth, pharynx, or larynx and in patients with acute circulatory failure (shock) or fixed cardiac output.

**Gas cylinders**

Each gas cylinder bears a label with the name of the gas contained in the cylinder. The name or chemical symbol of the gas appears on the shoulder of the cylinder and is also clearly and indelibly stamped on the cylinder valve. The colours on the valve end of the cylinder extend down to the shoulder; in the case of mixed gases the colours for the individual gases are applied in four segments, two for each colour.

Gas cylinders should be stored in a cool well-ventilated room, free from flammable materials.

**Anaesthesia, sedation, and resuscitation in dental practice**

For details see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care* report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Conscious Sedation in the Provision of Dental Care*, report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003. Both documents are available at [www.dh.gov.uk](http://www.dh.gov.uk).

Guidance is also included in *Standards for Dental Professionals*, London, General Dental Council, May 2005 (and as amended subsequently), and *Conscious Sedation in Dentistry: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, May 2006.

**15.1 Intravenous anaesthetics**

The drugs in this section should be used by experienced personnel only and when resuscitation equipment is available.

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time and can cause apnoea and hypotension, and so adequate resuscitative facilities must be available. They are contra-indicated if the anaesthetist is not confident of being able to maintain the airway (e.g. in the presence of a tumour in the pharynx or larynx). Extreme care is required in surgery of the mouth, pharynx, or larynx and in patients with acute circulatory failure (shock) or fixed cardiac output.
To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug (section 15.1.5) or a short-acting opioid (section 15.1.4.3).

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’). The doses and rates of administration should be reduced in the elderly, and particularly in those with hypovolaemia or cardiovascular disease; lower doses may also be required in premedicated patients.

**Total intravenous anaesthesia** This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

**Anaesthesia and driving** See section 15.1.

---

**Drugs used for intravenous anaesthesia**

**Propofol**, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates.

Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. It causes pain on intravenous injection, which can be reduced by intravenous lidocaine. Significant extraneous muscle movements can occur. Rarely, convulsions, anaphylaxis, and delayed recovery from anaesthesia can occur after propofol administration; the onset of convulsions can be delayed. Propofol is associated with bradycardia, occasionally profound; intravenous administration of an anmiscuscaric drug is used to treat this.

Propofol can be used for sedation during diagnostic procedures. In adults, it can be used for sedation in intensive care, but it is contra-indicated in children under 16 years receiving intensive care because of the risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, cardiac failure, rhabdomyolysis, hyperlipidaemia, and hepatomegaly).

**Thiopental sodium** is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

**Etomidate** is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction. Pain on injection can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction. Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia.

**Ketamine** is used rarely. Ketamine causes less hypotension than thiopental and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam or midazolam.

---

**ETOMIDATE**

**Indications** induction of anaesthesia

**Cautions** see under Intravenous Anaesthetics and notes above; avoid in acute porphyria (section 9.8.2); **interactions**: Appendix 1 (anaesthetics, general)

**Contra-indications** see under Intravenous Anaesthetics and notes above

**Hepatic impairment** reduce dose in liver cirrhosis

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above; also nausea, vomiting; hypotension; apnoea, hyperventilation, stridor; rash; less commonly hypersalivation, arrhythmia, hypertension, hiccups, cough, phlebitis; AV block, cardiac arrest, respiratory depression, seizures, shivering, and Stevens-Johnson syndrome also reported

**Dose**

- See under preparations

**Etomidate-Lipuro®** (Braun)

**Injection** (emulsion), etomidate 2 mg/mL, net price 10-mL amp = £1.53

**Dose**

- **ADULT** and **CHILD** over 6 months, by slow intravenous injection, 150–300 micrograms/kg; **CHILD** under 10 years may need up to 400 micrograms/kg, **ELDERLY** 150–200 micrograms/kg

**Hypnomidate®** (Janssen-Cilag)

**Injection**, etomidate 2 mg/mL, net price 10-mL amp = £1.38

**Excipients** include propylene glycol (see Excipients, p. 2)

**Dose**

- **ADULT** and **CHILD**, by slow intravenous injection, 300 micrograms/kg (max. total dose 60 mg); **ELDERLY** 150–200 micrograms/kg (max. total dose 60 mg)

---

**KETAMINE**

**Indications** induction and maintenance of anaesthesia (but rarely used)

**Cautions** see under Intravenous Anaesthetics and notes above; dehydration; hypertension; respiratory tract infection; increased cerebrospinal fluid pressure; predisposition to seizures, hallucinations, or nightmares; psychotid disorders; head injury or intracranial mass lesions; thyroid dysfunction, raised intra-ocular pressure; **interactions**: Appendix 1 (anaesthetics, general)

**Contra-indications** see under Intravenous Anaesthetics; hypertension, pre-eclampsia or eclampsia,
severe cardiac disease, stroke; raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

Hepatic impairment consider dose reduction

Pregnancy may depress neonatal respiration if used during delivery

Breast-feeding avoid for at least 12 hours after last dose

Side-effects see notes above; also nausea, vomiting; tachycardia, hypertension, arrhythmias, hypotension, bradycardia; hypersalivation, laryngospasm; anxiety, insomnia; diplopia, nystagmus, raised intra-ocular pressure; rash; apnoea and respiratory depression also reported

Dose

- By intramuscular injection, short procedures, initially 6.5–13 mg/kg, adjusted according to response (10 mg/kg usually produces 12–25 minutes of surgical anaesthesia)

Diagnostic manoeuvres and procedures not involving intense pain, initially 4 mg/kg

- By intravenous injection over at least 60 seconds, short procedures, initially 1–4.5 mg/kg, adjusted according to response (2 mg/kg usually produces 5–10 minutes of surgical anaesthesia)

- By intravenous infusion of a solution containing 1 mg/mL, longer procedures, induction, total dose of 0.5–2 mg/kg; maintenance, 10–45 micrograms/kg/minute, rate adjusted according to response

Ketalar® (Pfizer) 

Injection, ketamine (as hydrochloride) 10 mg/mL, net price 20-mL vial = £5.06; 50 mg/mL, 10-mL vial = £8.77; 100 mg/mL, 10-mL vial = £16.10 

Note For intravenous injection, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9% or Water for Injections

PROPOFOL

Indications see under Dose

Cautions see under Intravenous Anaesthetics and notes above; cardiac impairment; respiratory impairment; elderly; hypovolaemia; epilepsy; hypotension; raised intracranial pressure; monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days; Interactions: Appendix 1 (anaesthetics, general)

Contra-indications see notes above

Hepatic impairment use with caution

Renal impairment use with caution

Pregnancy may depress neonatal respiration if used during delivery; max. dose for maintenance of anaesthesia 6 mg/kg/hour

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above; also hypotension, tachycardia, flushing; transient apnoea, hyperventilation, coughing, and hiccup during induction; head-ache; less commonly thrombosis, phlebitis; rarely arrhythmia, headache, vertigo, shivering, euphoria; very rarely pancreatitis, pulmonary oedema, sexual disinhibition, and discoloration of urine; serious and sometimes fatal side-effects reported with prolonged infusion of doses exceeding 5 mg/kg/hour, including metabolic acidosis, rhabdomyolysis, hyperkalaemia, and cardiac failure; dystonia and dyskinesia also reported

Dose

- Induction of anaesthesia using 0.5% or 1% injection, by intravenous injection or infusion, ADULT under 55 years and CHILD over 12 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response; ADULT over 55 years or debilitating, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; CHILD 1 month–12 years, administer slowly until response (usual dose in child over 8 years 2.5 mg/kg, may need more in younger child e.g. 2.5–4 mg/kg)

- Induction of anaesthesia using 2% injection, by intravenous infusion, ADULT under 55 years and CHILD over 12 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds; ADULT over 55 years or debilitating, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; CHILD 3–12 years, administer slowly until response (usual dose in child over 8 years 2.5 mg/kg, may need more in younger child e.g. 2.5–4 mg/kg)

- Maintenance of anaesthesia using 1% injection, by intravenous infusion, 4–12 mg/kg/hour (3–6 mg/kg/hour in ELDERLY or debilitated) or by intravenous injection, 25–50 mg repeated according to response; CHILD 1 month–12 years, by intravenous infusion, 9–15 mg/kg/hour

- Maintenance of anaesthesia using 2% injection, by intravenous infusion, 4–12 mg/kg/hour (3–6 mg/kg/hour in ELDERLY or debilitated); CHILD 3–12 years, by intravenous infusion, 9–15 mg/kg/hour

- Sedation of ventilated patients in intensive care using 1% or 2% injection, by intravenous infusion, ADULT and CHILD over 16 years, 0.3–4 mg/kg/hour

- Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection, ADULT and CHILD over 12 years, initially by intravenous injection over 1–5 minutes, 0.5–1 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response; CHILD 1 month–12 years, 1–2 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response

- Induction of sedation for surgical and diagnostic procedures using 2% injection, ADULT and CHILD over 12 years, initially by intravenous infusion over 1–5 minutes, 0.5–1 mg/kg, dose and rate of administration adjusted to desired level of sedation and response

- Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection, by intravenous infusion, ADULT and CHILD over 12 years, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration

- Maintenance of sedation for surgical and diagnostic procedures using 1% injection, by intravenous infusion, ADULT and CHILD over 12 years, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 1 month–12 years, 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in response required, by intravenous injection, max. 1 mg/kg).

778 15.1.1 Intravenous anaesthetics
BNF 61

- Maintenance of sedation for surgical and diagnostic procedures using 2% injection, by intravenous infusion, ADULT and CHILD over 12 years, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by intravenous injection using 0.5% or 1% injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 3–12 years, 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response.

Propofol (Non-proprietary) [Trade] 0.5% injection (emulsion), propofol 5 mg/mL, net price 20-mL amp = £3.46
Brands include Propofol-Lipuro®
1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £4.18, 50-mL bottle = £10.10, 100-mL bottle = £19.40
Brands include Propofol-Lipuro®, Propoven®
2% injection (emulsion), propofol 20 mg/mL, net price 50-mL vial = £21.30
Brands include Propofol-Lipuro®, Propoven®

Diprivan® (AstraZeneca) [Trade] 1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £1.07, 50-mL prefilled syringe (for use with Diprifusor® TCI system) = £4.72
2% injection (emulsion), propofol 20 mg/mL, net price 50-mL prefilled syringe (for use with Diprifusor® TCI system) = £5.27

Note Diprifusor® TCI (target controlled infusion) system is licensed only for induction and maintenance of general anaesthesia in adults.

THIOPENTAL SODIUM
(Thiopentone sodium)

Indications induction of general anaesthesia; anaesthesia of short duration; reduction of raised intracranial pressure if ventilation controlled; status epilepticus (see also section 4.8.2)

Cautions see notes above; cardiovascular disease; reconstituted solution is highly alkaline—extravasation causes tissue necrosis and severe pain; avoid intra-arterial injection; interactions: Appendix 1 (anaesthetics, general)

Contra-indications see notes above; acute porphyria (section 9.8.2); myotonic dystrophy

Hepatic impairment use with caution—reduce dose

Renal impairment caution in severe impairment

Pregnancy may depress neonatal respiration if used during delivery; dose should not exceed 250 mg

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects hypotension, arrhythmias, myocardial depression, laryngeal spasm, cough, headache, sneezing, hypersensitivity reactions, rash

Dose
- Induction of general anaesthesia, by slow intravenous injection usually as a 2.5% (25 mg/mL) solution, ADULT over 18 years, fit and premedicated, initially 100–150 mg (reduced in elderly or debilitated) over 10–15 seconds (longer in elderly or debilitated), followed by further quantity if necessary according to response after 30–60 seconds; or up to 4 mg/kg (max.

15.1.2 Inhalational anaesthetics

500 mg); CHILD 1 month–18 years, initially up to 4 mg/kg, then 1 mg/kg repeated as necessary (max. total dose 7 mg/kg)
- Raised intracranial pressure, by slow intravenous injection, 1.5–3 mg/kg, repeated as required
- Status epilepticus (only if other measures fail, see section 4.8.2), by slow intravenous injection as a 2.5% (25 mg/mL) solution, ADULT over 18 years, 75–125 mg as a single dose; CHILD 1 month–18 years, initially up to 4 mg/kg by slow intravenous injection, then up to 8 mg/kg/hour by continuous intravenous infusion, adjusted according to response

Thiopental (Archimedes) [Trade] Injection, powder for reconstitution, thiopental sodium, net price 500-mg vial = £3.68

Important The drugs in this section should be used by experienced personnel only and when resuscitation equipment is available.

Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. They may be supplied via hospital pipelines or from metal cylinders (section 15.1). Volatile liquid anaesthetics are administered using calibrated vapourisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide is being administered, see Nitrous Oxide, p. 781.

Anaesthesia and driving See section 15.1.

Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic (section 15.1.1).

Volatile liquid anaesthetics can trigger malignant hyperthermia (section 15.1.8) and are contra-indicated in those susceptible to malignant hyperthermia. They can increase cerebrospinal pressure and should be used with caution in those with raised intracranial pressure. They can also cause hepatotoxicity in those sensitised to halogenated anaesthetics; halothane has been associated with severe hepatotoxicity (important: see below). In children with neuromuscular disease, inhalational anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death. Cardiorespiratory depression, hypotension, and arrhythmias are common side-effects of volatile liquid anaesthetics.

Isoflurane is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle...
**Desflurane** is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract; cough, breath-holding, apnoea, laryngospasm, and increased secretions can occur.

**Sevoflurane** is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and seldom induces coughing or breath-holding.

**Isoflurane** is a rapid acting volatile liquid anaesthetic that has largely been superseded by newer agents, but is occasionally used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics. Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

**Halothane** is a volatile liquid anaesthetic that has largely been superseded by newer agents, but is occasionally used for inhalation induction of anaesthesia. It occurs more frequently after repeated exposure to halothane and has a high mortality. The risk of severe hepatotoxicity appears to be increased by repeated exposures within a short time interval, but even after a long interval (sometimes of several years), susceptible patients have been reported to develop jaundice. Since there is no reliable way of identifying patients at risk, the following precautions are recommended before the use of halothane:

- a careful anaesthetic history should be taken to determine previous exposure and previous reactions to halothane;
- repeated exposure to halothane within a period of at least 3 months should be avoided unless there are overriding clinical circumstances;
- a history of unexplained jaundice or pyrexia in a patient following exposure to halothane is an absolute contra-indication to its future use in that patient.

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

**Dose**

- Induction of anaesthesia (but not recommended), by inhalation through specifically calibrated vaporiser, **ADULT 4–11%**
- Maintenance of anaesthesia, by inhalation through specifically calibrated vaporiser, **ADULT 2–6% in nitrous oxide; 2.5–8.5% in oxygen or oxygen-enriched air; CHILD see BNF for Children**

**Halothane**

**Indications** see notes above

**Cautions** see notes above (important: see Halothane Hepatotoxicity, above); avoid for dental procedures in those under 18 years unless treated in hospital (high risk of arrhythmia); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Hepatic impairment** avoid if history of unexplained pyrexia or jaundice following previous exposure to halothane

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

**Dose**

- Induction of anaesthesia, using specifically calibrated vaporiser, in oxygen or nitrous oxide-oxygen, **ADULT and CHILD over 1 month, 0.5–2%**
- Maintenance of anaesthesia, using specifically calibrated vaporiser, in oxygen, oxygen-air, or nitrous oxide-oxygen, **ADULT and CHILD over 1 month, 0.5–2%**

**Isoflurane**

**Indications** see notes above

**Cautions** see notes above; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

**Dose**

- Induction of anaesthesia, using specifically calibrated vaporiser, in oxygen or nitrous oxide-oxygen, increased gradually from 0.5% to 3%
- Maintenance of anaesthesia, using specifically calibrated vaporiser, 1–2.5% in nitrous oxide-oxygen; an additional 0.5–1% may be required when given with oxygen alone; caesarean section, 0.5–0.75% in nitrous oxide-oxygen

**Sevoflurane**

**Indications** see notes above

**Cautions** see notes above; **interactions:** Appendix 1 (anaesthetics, general)
15.1.3 Antimuscarinic drugs

**Nitrous oxide**

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equanox®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in the presence of a pneumothorax, which may enlarge to produce compression respiration, or in the presence of intracranial air after head injury.

Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin $B_12$; neurological toxic effects can occur without preceding overt haematological changes. For the same reason, exposure of theatre staff to nitrous oxide should be minimised.

Assessment of plasma-vitamin $B_12$ concentration should be considered in those at risk of deficiency, including the elderly, those with a poor or vegetarian diet, and those with a history of anaemia. Nitrous oxide should be avoided in those with a history of anaemia. Nitrous oxide should be avoided in those with anaemia. Nitrous oxide should not be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

**Indications**

- Analgesia, up to 50% in oxygen, according to the patient’s needs
- Maintenance of anaesthesia in conjunction with other anaesthetic agents (using suitable anaesthetic apparatus), 50–66% in oxygen
- Analgesia, up to 50% in oxygen, according to the patient’s needs

**Dose**

- Induction of anaesthesia, using a specifically calibrated vaporiser, in oxygen or nitrous oxide-oxygen, adjusted according to response, ADULT and CHILD over 1 month initially 0.5–1%, then increased gradually up to 8%
- Maintenance of anaesthesia, using a specifically calibrated vaporiser, in oxygen or nitrous oxide-oxygen, adjusted according to response, ADULT and CHILD over 1 month 0.5–3%

**Side-effects**

- See notes above; also urinary retention, leucopenia, agitation in children; dystonia and seizures also reported

**Contra-indications**

- Renal impairment
- Pregnancy: may depress neonatal respiration if used during delivery
- Breast-feeding: breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Pregnancy**

- May depress neonatal respiration if used during delivery
- Breast-feeding: breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Breast-feeding**

- Breast-feeding soon as mother has recovered sufficiently from anaesthesia

**Side-effects**

- See notes above

**Dose**

- Maintenance of anaesthesia in conjunction with other anaesthetic agents (using suitable anaesthetic apparatus), 50–66% in oxygen
- Analgesia, up to 50% in oxygen, according to the patient’s needs

**Indications**

- See notes above

**Cautions**

- Use with caution when used alone.

**Phenothiazines**

- Do not effectively reduce secretions
- Do not reduce secretions in patients with air-containing closed space
- Do not effectively reduce secretions in patients with air-containing closed space

**Hyoscine hydrobromide**

- Reduces secretions and also has an emergency role in the treatment of vagotonic side-effects
- For its role in acute arrhythmias after myocardial infarction, see section 2.3.1.

**Glycopyrronium bromide**

- Reduces secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics
- Reduces secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics

**Atropine sulphate**

- Is now rarely used for premedication
- But still has an emergency role in the treatment of vagotonic side-effects
- For its role in acute arrhythmias after myocardial infarction, see section 2.3.1.

**Phenothiazines**

- Do not effectively reduce secretions
- When used alone

**Important**

- The drugs in this section should be used by experienced personnel only.

**Antimuscarinic drugs**

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine (section 15.1.6) to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as halothane, propofol, and suxamethonium.

**Atropine sulphate**

- Is now rarely used for premedication
- But still has an emergency role in the treatment of vagotonic side-effects
- For its role in acute arrhythmias after myocardial infarction, see section 2.3.1.

**Hyoscine hydrobromide**

- Reduces secretions and also has an emergency role in the treatment of vagotonic side-effects
- For its role in acute arrhythmias after myocardial infarction, see section 2.3.1.

**Glycopyrronium bromide**

- Reduces salivary secretions.

**Atropine sulphate**

- Is now rarely used for premedication
- But still has an emergency role in the treatment of vagotonic side-effects
- For its role in acute arrhythmias after myocardial infarction, see section 2.3.1.

**Phenothiazines**

- Do not effectively reduce secretions
- When used alone

**Antimuscarinic drugs**

- Are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics.

**Indications**

- Premedication; intra-operative bradycardia; with anticholinesterases for reversal of non-depolarising neuromuscular blocking drugs (section 15.1.5).

**Phenothiazines**

- Do not effectively reduce secretions when used alone.
15.1.4 Sedative and analgesic peri-operative drugs

Cautions section 1.2

Duration of action Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.

Contra-indications section 1.2

Pregnancy not known to be harmful; use with caution.

Breast-feeding small amount present in milk—use with caution.

Side-effects section 1.2

Dose

Premedication, by intravenous injection, 300–600 micrograms immediately before induction of anaesthesia; CHILD under 12 years see BNF for Children.

By subcutaneous or intramuscular injection, 300–600 micrograms 30–60 minutes before induction of anaesthesia; CHILD under 12 years see BNF for Children.

Intra-operative bradycardia, by intravenous injection, 300–600 micrograms (larger doses in emergencies); CHILD under 12 years see BNF for Children.

Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block, by intravenous injection, 200 micrograms per 1 mg of neostigmine, or 10–15 micrograms/kg; CHILD 1 month–12 years, 10 micrograms/kg (max. 500 micrograms).

Duration of action

Atropine has a shorter duration of action than neostigmine (section 13.12).

Hypersensitivity reaction (section 4.3).

Premedication

Premedication These drugs are given to allay fear and anxiety in the pre-operative period (including the night before an operation), to relieve pain and discomfort when present, and to augment the action of subsequent

1 Atropine (Non-proprietary). Injection, atropine sulphate 600 micrograms/mL, net price 1-mL amp $6.20. 

Note Other strengths also available.

Injection, prefilled disposable syringe, atropine sulphate 100 micrograms/mL, net price 5 mL = £4.58, 10 mL = £9.16, 30 mL = £8.95.

Injection, prefilled disposable syringe, atropine sulphate 200 micrograms/mL, net price 5 mL = £5.91, 10 mL = £5.91; 300 micrograms/mL, 1 mL = £5.91.

1. Restriction does not apply where administration is for saving life in emergency.

1 Minijet® Atropine (UCB Pharma). Injection, atropine sulphate 100 micrograms/mL, net price 5 mL = £0.54, 10 mL = £0.93, 30 mL = £0.85.

1. Restriction does not apply where administration is for saving life in emergency.

15.1.4.1 Anxiolytics

15.1.4.2 Non-opioid analgesics

15.1.4.3 Opioid analgesics

Important

The drugs in this section should be used by experienced personnel only.
anaesthetic agents. A number of the drugs used also provide some degree of pre-operative amnesia. The choice will vary with the individual patient, the nature of the operative procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and recovery facilities. The choice also varies between elective and emergency operations.

**Premedication in children** Oral administration is preferred where possible; the rectal route should only be used in exceptional circumstances. For further details, consult *BNF for Children*.

Application of a local anaesthetic (section 15.2) to the injection site can help to prevent pain.

**Dental procedures** Anxiolytics diminish tension, anxiety and panic, and may benefit anxious patients. However, their use is no substitute for sympathy and reassurance.

Diazepam and temazepam are effective anxiolytics for dental treatment in adults, but they are less suitable for children. Diazepam has a longer duration of action than temazepam. When given at night diazepam is associated with more residual effects the following day; patients should be very carefully warned not to drive (important: for general advice on anaesthesia and driving see p. 776). For further information on hypnotics and anxiolytics, see section 4.1. For further information on hypnotics used for dental procedures, see section 4.1.1.

**Anaesthesia and driving** See section 15.1.

### 15.1.4.1 Anxiolytics

Anxiolytic benzodiazepines are widely used for premedication.

**Benzodiazepines**

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. They have no analgesic effect so an opioid analgesic may sometimes be required for pain.

Benzodiazepines can alleviate anxiety at doses that do not necessarily cause excessive sedation and they are of particular value during short procedures or during operations under local anaesthesia (including dentistry). Amnesia reduces the likelihood of any unpleasant memories of the procedure (although benzodiazepines, particularly when used for more profound sedation, can sometimes induce sexual fantasies). Benzodiazepines are also used in intensive care units for sedation, particularly when used for more profound sedation, can sometimes induce sexual fantasies. Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil (section 15.1.7) is used to antagonise the effects of benzodiazepines. They are best avoided in myasthenia gravis, especially peri-operatively.

Diazepam is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not generally recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection. Diazepam is also available as a rectal solution but this preparation is not used for premedication or sedation.

Temazepam is given by mouth and has a shorter duration of action and a more rapid onset than diazepam given by mouth. It has been used as a premedicant in inpatient and day-case surgery; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam produces more prolonged sedation than temazepam and it has marked amnesic effects. It is used as a premedicant the night before major surgery; a further, smaller dose may be required the following morning if any delay in starting surgery is anticipated. Alternatively the first dose may be given early in the morning on the day of operation.

Midazolam is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

**Overdosage with midazolam**

There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil (section 15.1.7) is available when midazolam is used, to reverse the effects if necessary.
Side-effects see notes above and section 4.1.2

Dose
- By mouth, 5–10 mg 1–2 hours before procedure (up to max. 20 mg for dental procedures carried out in hospital); ELDERLY (or debilitated), half adult dose
- By intravenous injection into a large vein (emulsion preparation preferred), sedative cover for minor surgical and medical procedures, ADULT over 18 years, 10–20 mg over 2–4 minutes, immediately before procedure; premedication 100–200 micrograms/kg, CHILD under 18 years see BNF for Children
- By rectum, CHILD 1–18 years see BNF for Children

Preparations
Section 4.1.2

LORAZEPAM

Indications conscious sedation for procedures; premedication; short-term use in anxiety or insomnia (section 4.1.2); status epilepticus (section 4.8.2)

Cautions see notes above and section 4.1.2; interactions: Appendix 1 (anxiolytics and hypnotics)

Contra-indications see notes above and Diazepam, section 4.1.2

Hepatic impairment see Benzodiazepines, section 4.1.2

Renal impairment see Benzodiazepines, section 4.1.2

Pregnancy see Benzodiazepines, section 4.1.2

Breast-feeding see Benzodiazepines, section 4.1.2

Side-effects see notes above and Diazepam, section 4.1.2

Dose
- By mouth, 2–3 mg the night before operation; 2–4 mg 1–2 hours before operation
- By slow intravenous injection, preferably diluted with an equal volume of sodium chloride intravenous infusion 0.9% or water for injections, 50 micrograms/kg 30–45 minutes before operation
- By intramuscular injection, diluted as above, 50 micrograms/kg 60–90 minutes before operation

Preparations
Section 4.1.2

MIDAZOLAM

Indications conscious sedation for procedures; sedation in intensive care; sedation in anaesthesia; premedication; induction of anaesthesia; status epilepticus (section 4.8.2)

Cautions see notes above; cardiac disease; respiratory disease; myasthenia gravis; neonates; children (particularly if cardiovascular impairment); risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation); history of drug or alcohol abuse; reduce dose in elderly and debilitated; risk of severe hypotension in hypovolaemia, vasoconstriction, hypothermia; avoid prolonged use (and abrupt withdrawal thereafter); concentration of midazolam in children under 15 kg not to exceed 1 mg/mL; interactions: Appendix 1 (anxiolytics and hypnotics)

Contra-indications marked neuromuscular respiratory weakness including unstable myasthenia gravis; severe respiratory depression; acute pulmonary insufficiency

Hepatic impairment use with caution; can precipitate coma

Renal impairment start with small doses in severe impairment; increased cerebral sensitivity

Pregnancy avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression)

Breast-feeding present in milk—avoid breast-feeding for 24 hours after administration

Side-effects see notes above; gastro-intestinal disturbances, increased appetite, jaundice; hypotension, cardiac arrest, heart rate changes, anaphylaxis, thrombosis; laryngospasm, bronchospasm, respiratory depression and respiratory arrest (particularly with high doses or on rapid injection); drowsiness, confusion, ataxia, amnesia, headache, euphoria, hallucinations, convulsions (more common in neonates), dizziness, vertigo, involuntary movements, paradoxical excitement and aggression (especially in children and elderly), dysarthria; urinary retention, incontinence, changes in libido; blood disorders; muscle weakness; visual disturbances; salivation changes; skin reactions; injection-site reactions

Dose
- Conscious sedation for procedures, by slow intravenous injection (approx. 2 mg/minute) 5–10 minutes before procedure, initially 2–2.5 mg ELDERLY 0.5–1 mg), increased if necessary in steps of 1 mg ELDERLY 0.5–1 mg); usual total dose 3.5–5 mg (max. 7.5 mg), ELDERLY max. 3.5 mg; CHILD 1 month–18 years see BNF for Children
- By rectum, CHILD 6 months–18 years see BNF for Children
- By mouth, CHILD 1 month–18 years see BNF for Children
- By buccal administration, CHILD 6 months–18 years see BNF for Children

Sedative in combined anaesthesia, by intravenous injection, 30–100 micrograms/kg repeated as required or by continuous intravenous infusion, 30–100 micrograms/kg/hour (ELDERLY lower doses needed); CHILD not recommended

Premedication, by deep intramuscular injection, ADULT over 18 years, 70–100 micrograms/kg (ELDERLY or debilitated 25–50 micrograms/kg) 20–60 minutes before induction

By intravenous injection, ADULT over 18 years, 1–2 mg 5–30 minutes before procedure, repeated as required (ELDERLY or debilitated 0.5 mg, repeat dose slowly as required)

By rectum, CHILD 6 months–12 years see BNF for Children

By mouth, CHILD 1 month–18 years see BNF for Children

Induction (but rarely used), by slow intravenous injection, 150–200 micrograms/kg (ELDERLY or debilitated 50–150 micrograms/kg) given in divided doses (max. 5 mg) at intervals of 2 minutes; max. total dose 600 micrograms/kg; CHILD 7–18 years initially 150 micrograms/kg (max. 7.5 mg) given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes then give additional doses of 50 micrograms/kg (max. 2.5 mg) every 2 minutes if necessary; max. total dose 500 micrograms/kg (not exceeding 25 mg)
● Sedation of patients receiving intensive care, by slow intravenous injection, initially 30–300 micrograms/kg given in steps of 1–2.5 mg every 2 minutes, then by slow intravenous injection or by continuous intravenous infusion, 30–200 micrograms/kg/hour; reduce dose (or reduce or omit initial dose) in hypoventilation, vasoconstriction, or hypothermia; lower doses may be adequate if opioid analgesic also used; CHILD under 12 years see BNF for Children

Midazolam (Non-proprietary)

Oral liquid, midazolam 2.5 mg/mL, 100 mL. Available from ‘special-order’ manufacturers or specialist importing companies, see p. 988

Injection, midazolam (as hydrochloride) 1 mg/mL, net price 2-mL amp = 50p, 5-mL amp = 60p, 50-mL vial = £7.87; 2 mg/mL, 5-mL amp = 65p; 5 mg/mL, 2-mL amp = 58p, 10-mL amp = £2.50

Hypnovel® (Roche) 6

Injection, midazolam (as hydrochloride) 2 mg/mL, net price 5-mL amp = 85p; 5 mg/mL, 2-mL amp = 72p

TEMAZEPAM

Indications premedication before surgery or investigatory procedures; hypnotic (section 4.1.1)

Cautions see notes above and Diazepam, section 4.1.2; interactions: Appendix 1 (anxiolytics and hypnotics)

Contra-indications see notes above and Diazepam, section 4.1.2

Hepatic impairment see Benzodiazepines, section 4.1.1

Renal impairment see Benzodiazepines, section 4.1.1

Pregnancy see Benzodiazepines, section 4.1.1

Breast-feeding see Benzodiazepines, section 4.1.1

Side-effects see notes above and Diazepam, section 4.1.2

Dose

● By mouth, premedication. ADULT, 10–20 mg (up to 30 mg in exceptional circumstances) 1–2 hours before procedure; ELDERLY 10 mg (up to 20 mg in exceptional circumstances); CHILD 1 mg/kg (max. 30 mg)

Note Temazepam doses in BNF may differ from those in product literature

Preparations

Section 4.1.1

KETOROLAC TROMETAMOL

Indications short-term management of moderate to severe acute postoperative pain only

Cautions section 10.1.1; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (NSAIDs)

Contra-indications section 10.1.1; also complete or partial syndrome of nasal polyps; haemorrhagic diatheses (including coagulation disorders) and following operations with high risk of haemorrhage or incomplete haemostasis; confirmed or suspected cerebrovascular bleeding; hypovolaemia or dehydration

Hepatic impairment section 10.1.1

Renal impairment max. 60 mg daily by intramuscular or intravenous injection; avoid if serum creatinine greater than 160 micromol/litre; see also section 10.1.1

Pregnancy section 10.1.1

Breast-feeding amount too small to be harmful

Side-effects section 10.1.1; also gastro-intestinal disturbances, taste disturbances, dry mouth; flushing, bradycardia, palpitation, chest pain, hypertension, pallor; dyspnoea, asthma; malaise, euphoria, psychosis, paraesthesia, convulsions, abnormal dreams, hyperkinesia, confusion, hallucinations; urinary frequency, thirst, sweating; hyponatraemia, hyperkalaemia, myalgia; visual disturbances (including optic neuritis); purpura, pain at injection site

Dose

● ADULT and CHILD over 16 years, by mouth, 10 mg every 4–6 hours (ELDERLY every 6–8 hours) as required; max. 40 mg daily; max. duration of treatment 7 days

● ADULT and CHILD over 16 years, by intramuscular injection or by intravenous injection over at least 15 seconds, initially 10 mg, then 10–30 mg every 4–6 hours as required (up to every 2 hours during initial postoperative period); max. 90 mg daily (ELDERLY and patients weighing less than 50 kg max. 60 mg daily); max. duration of treatment 2 days; CHILD 6 months–16 years see BNF for Children

Note When converting from parenteral to oral administration, total combined dose on the day of converting should not exceed 90 mg (60 mg in the elderly and patients weighing less than 50 kg) of which the oral component should not exceed 40 mg

Ketorolac (Non-proprietary)

Injection, ketorolac trometamol 30 mg/mL, net price 1-mL amp = £1.10

Toradol® (Roche) 6

Tablets, ivory, f/c, ketorolac trometamol 10 mg, net price 20-tab pack = £5.45. Label: 17, 21

Injection, ketorolac trometamol 10 mg/mL, net price 1-mL amp = 89p; 30 mg/mL, 1-mL amp = £1.08

15.1.4 Sedative and analgesic peri-operative drugs

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may not depress respiration, do not impair gastrointestinal function, do not cause dependence, they may be effective alternatives to the parenteral use of these drugs.

Acemetacin, diclofenac, flurbiprofen, ibuprofen, ketoprofen, (section 10.1.1), parecoxib, and ketorolac are licensed for use as an analgesic for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Acemetacin, diclofenac, flurbiprofen, ibuprofen, ketoprofen, (section 10.1.1), parecoxib, and ketorolac are licensed for use as an analgesic for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.
**PARECOXIB**

**Indications** short-term management of acute post-operative pain

**Cautions** section 10.1.1; dehydration; following coronary artery bypass graft surgery; **interactions:** Appendix 1 (NSAIDs)

**Contra-indications** section 10.1.1; also history of allergic drug reactions including sulphonamide hypersensitivity; inflammatory bowel disease

**Hepatic impairment** halve dose in moderate impairment (max. 40 mg daily); see also section 10.1.1

**Renal impairment** section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** section 10.1.1; also flatulence, hypertension, hypoesthesia, altered taste, postoperative nausea and vomiting, convulsions; rarely cyanosis; rarely tachycardia

**Dose**

- By deep intramuscular injection or by intravenous injection, initially 40 mg, then 20–40 mg every 6–12 hours when required for up to 3 days; max. 80 mg daily; **ELDERLY** weighing less than 50 kg, initially 20 mg, then max. 40 mg daily; **CHILD** under 18 years, not recommended

**Dynastat® (Pharmacia)** ▼ 75/300

**Injection** powder for reconstitution, parecoxib (as sodium salt), net price 40-mg vial = £4.96, 40-mg vial (with solvent) = £5.67

---

**15.1.4 Opioid analgesics**

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; for general notes on opioid analgesics and their use in postoperative pain, see section 4.7.2.

For the management of opioid-induced respiratory depression, see section 15.1.7.

**Intra-operative analgesia** Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil, fentanyl, and remifentanil are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplemental analgesic is given before stopping the infusion of remifentanil.

---

**ALFENTANIL**

**Indications** analgesia especially during short operative procedure and outpatient surgery; enhancement of anaesthesia; analgesia and suppression of respiratory activity in patients receiving intensive care, with assisted ventilation, for up to 4 days

**Cautions** section 4.7.2 and notes above

**Contra-indications** section 4.7.2

**Hepatic impairment** section 4.7.2

**Renal impairment** section 4.7.2

**Pregnancy** section 4.7.2

**Breast-feeding** present in milk— with breast-feeding for 24 hours

**Side-effects** section 4.7.2 and notes above; also hypertension, myoclonic movements; less commonly arrhythmias, hiccup, laryngospasm; rarely epistaxis; also reported cardiac arrest, cough, convulsions, and pyrexia

**Dose**

- To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

---

**Alfentanil (Non-proprietary)**

**Injection**, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 70p, 10-mL amp = £3.20

**Intensive care injection**, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.50

**Note** To be diluted before use
Fentanyl

**Indications** analgesia during operation, enhancement of anaesthesia; respiratory depressant in assisted respiration; analgesia in other situations (section 4.7.2)

**Cautions** see Fentanyl, section 4.7.2 and notes above

**Contra-indications** see notes in section 4.7.2

**Hepatic impairment** see notes in section 4.7.2

**Renal impairment** see notes in section 4.7.2

**Pregnancy** see notes in section 4.7.2

**Breast-feeding** see notes in section 4.7.2

**Side-effects** see Fentanyl, section 4.7.2 and notes above; also myoclonic movements; less commonly laryngospasm; rarely asystole and insomnia

**Dose** To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- By slow intravenous injection, with spontaneous respiration, **ADULT** and **CHILD** over 12 years, initially 50–100 micrograms (max. 200 micrograms on specialist advice), then 25–50 micrograms as required; **CHILD** 1 month–12 years see **BNF for Children**

  With assisted ventilation, **ADULT** and **CHILD** over 12 years, initially 0.3–3.5 mg, then 100–200 micrograms as required; **CHILD** 1 month–12 years see **BNF for Children**

- By intravenous infusion, with spontaneous respiration, **ADULT** 3–4.8 micrograms/kg/hour adjusted according to response

  With assisted ventilation, **ADULT**, initially 10 micrograms/kg over 10 minutes then 6 micrograms/kg/hour adjusted according to response; may require up to 180 micrograms/kg/hour during cardiac surgery; **CHILD** 1 month–18 years see **BNF for Children**

**Fentanyl** (Non-proprietary)

**Injection**, fentanyl (as citrate) 50 micrograms/mL, net price 2-mL amp = £4p; 10-mL amp = £2.90

**Intensive care injection**, fentanyl (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.32

**Note** To be diluted before use

**REMIFENTANIL**

**Indications** supplementation of general anaesthesia during induction and analgesia during maintenance of anaesthesia (consult product literature for use in patients undergoing cardiac surgery); analgesia and sedation in ventilated, intensive care patients

**Cautions** section 4.7.2 (but no dose adjustment necessary in renal impairment) and notes above

**Contra-indications** section 4.7.2 and notes above; left ventricular dysfunction; analgesia in conscious patients

**Hepatic impairment** section 4.7.2

**Pregnancy** no information available: see also section 4.7.2

**Breast-feeding** avoid breast-feeding for 24 hours after administration—present in milk in animal studies

**Side-effects** section 4.7.2 and notes above; also hypertension; less commonly hypoxia; rarely asystole; AV block and convulsions also reported

**Dose** To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Induction of anaesthesia, **ADULT** and **CHILD** over 12 years, by **intravenous infusion**, 0.5–1 micrograms/kg/minute, with or without an initial dose by intravenous injection of 0.25–1 microgram/kg over at least 30 seconds

  **Note** If patient to be intubated more than 8 minutes after start of intravenous infusion, initial intravenous injection dose is not necessary

- Maintenance of anaesthesia in ventilated patients, **ADULT** and **CHILD** over 12 years, by **intravenous infusion**, 0.05–2 micrograms/kg/minute (with or without an initial dose by intravenous injection of 0.25–1 micrograms/kg over at least 30 seconds) according to anaesthetic technique and adjusted according to response; in light anaesthesia supplemental doses by intravenous injection every 2–5 minutes; **CHILD** 1–12 years, 0.05–1.3 micrograms/kg/minute (with or without an initial dose by intravenous injection of 0.1–1 microgram/kg over at least 30 seconds) according to anaesthetic technique and adjusted according to response

- Maintenance of anaesthesia with spontaneous respiration, **ADULT** and **CHILD** over 12 years, by **intravenous infusion**, initially 40 nanograms/kg/minute adjusted according to response, usual range 25–100 nanograms/kg/minute

- Analgesia and sedation in ventilated, intensive-care patients for max. 3 days, by **intravenous infusion**, **ADULT** over 18 years, initially 100–150 nanograms/kg/minute adjusted according to response in steps of 25 nanograms/kg/minute (allow at least 5 minutes between dose adjustments); usual range 6–740 nanograms/kg/minute; if an infusion rate of 200 nanograms/kg/minute does not produce adequate sedation add another sedative (consult product literature for details)

- Additional analgesia during stimulating or painful procedures in ventilated, intensive-care patients, by **intravenous infusion**, **ADULT** over 18 years, maintain infusion rate of at least 100 nanograms/kg/minute for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements, usual range 250–750 nanograms/kg/minute

- Cardiac surgery, consult product literature

**Note** Remifentanil doses in BNF may differ from those in product literature

**Ultiva** (GSK)

**Injection**, powder for reconstitution, remifentanil (as hydrochloride), net price 1-mg vial = £5.12; 2-mg vial = £10.23; 5-mg vial = £25.58
15.1.5 Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as muscle relaxants. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders (section 10.2.2) that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should always have their respiration assisted or controlled until the drug has been inactivated or antagonised (section 15.1.6). They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anti-cholinesterases such as neostigmine (section 15.1.6). Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium, rocuronium, and vecuronium, and the benzylisoquinolinium group, comprising atracurium, cisatracurium, and mivacurium.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than succinylcholine. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium and vecuronium, are more widely used than those with a longer duration of action, such as pancuronium.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium, with a rapid onset of effect, may facilitate intubation. Atracurium or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Cautions Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs. Their activity is prolonged in patients with myasthenia gravis and in hypothermia, and lower doses are required. Non-depolarising neuromuscular blocking drugs should be used with great care in those with other neuromuscular disorders and those with fluid and electrolyte disturbances, as response is unpredictable. Resistance can develop in patients with burns, who may require increased doses; low plasma cholinesterase activity in these patients requires dose titration for mivacurium. The rate of administration of neuromuscular blocking drugs should be reduced in patients with cardiovascular disease. Interactions: Appendix 1 (muscle relaxants).

Pregnancy Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

Breast-feeding Because they are ionised at physiological pH, non-depolarising neuromuscular blocking drugs are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

Side-effects Benzylisoquinolinium non-depolarising neuromuscular blocking drugs (except cisatracurium) are associated with histamine release, which can cause skin flushing, hypotension, tachycardia, bronchospasm, and very rarely anaphylactoid reactions. Most aminosteroid neuromuscular blocking drugs produce minimal histamine release. Drugs with vagolytic activity can counteract any bradycardia that occurs during surgery. Acute myopathy has also been reported after prolonged use in intensive care.

Atracurium, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release.

Cisatracurium is a single isomer of atracurium. It is more potent and has a slightly longer duration of action than atracurium and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.
15.1.5 Neuromuscular blocking drugs

**ATRACURIUM BESILATE**

**(Atracurium besylate)**

**Indications**  
neuromuscular blockade (short to intermediate duration) for surgery or during intensive care

**Cautions**  
see notes above

**Pregnancy**  
see notes above

**Breast-feeding**  
see notes above

**Side-effects**  
see notes above; seizures also reported

**Dose**  
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT** and **CHILD** over 1 month, by **intravenous injection**, initially 300–600 micrograms/kg; then 100–200 micrograms/kg as required or initially by **intravenous injection**, 200–600 micrograms/kg followed by **intravenous infusion**, 300–600 micrograms/kg/hour
- Intensive care, **ADULT** and **CHILD** over 1 month, by **intravenous injection**, initially 300–600 micrograms/kg (optional) then by **intravenous infusion** 270–1770 micrograms/kg/hour (usual dose 650–780 micrograms/kg/hour)

**Atracurium**  
**(Non-proprietary)**

**Injection**, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.85; 5-mL amp = £3.37; 25-mL vial = £14.45

**Tracrium®**  
**(GSK)**

**Injection**, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.66; 5-mL amp = £3.00; 25-mL vial = £12.91

**CISATRACURIUM**

**Indications**  
neuromuscular blockade (intermediate duration) for surgery or during intensive care

**Cautions**  
see notes above

**Pregnancy**  
see notes above

**Breast-feeding**  
see notes above; also bradycardia

**Dose**  
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT** and **CHILD** over 1 month, initially 150 micrograms/kg; then 20–100 micrograms/kg approx. every 20 minutes; **CHILD** 2–12 years, initially 20–60 micrograms/kg approx. every 10 minutes; or maintenance, by **intravenous infusion**, **ADULT** and **CHILD** over 2 years, initially 180 micrograms/kg/hour, then **after stabilisation**, 60–120 micrograms/kg/hour  
**Note**  
Lower doses can be used for children over 2 years when not for intubation

- Intensive care, **ADULT** initially 150 micrograms/kg (optional) by **intravenous injection**, then by **intravenous infusion** 180 micrograms/kg/hour adjusted according to response (usual range 30–600 micrograms/kg/hour)

**Nimbex®**  
**(GSK)**

**Injection**, cisatracurium (as besilate) 2 mg/mL, net price 10-mL amp = £7.55

**Forte injection**, cisatracurium (as besilate) 5 mg/mL, net price 30-mL vial = £31.09

**MIVACURUM**

**Indications**  
neuromuscular blockade (short duration) for surgery

**Cautions**  
see notes above; low plasma cholinesterase activity; elderly

**Hepatic impairment**  
reduce dose in severe impairment

**Renal impairment**  
clinical effect prolonged in renal failure—reduce dose according to response

**Pregnancy**  
see notes above

**Breast-feeding**  
see notes above

**Side-effects**  
see notes above

**Dose**  
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- By **intravenous injection**, 70–250 micrograms/kg; maintenance 100 micrograms/kg every 15 minutes; **CHILD** 2–6 months initially 150 micrograms/kg, 7 months–12 years initially 200 micrograms/kg; maintenance (**CHILD** 2 months–12 years) 100 micrograms/kg every 6–9 minutes

**Note**  
Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In patients with asthma, cardiovascular disease or those who are sensitive to falls in arterial blood pressure give over 60 seconds

- By **intravenous infusion** after initial bolus intravenous dose, maintenance of block, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by 1 microgram/kg/minute to usual dose of 6–7 micrograms/kg/minute; **CHILD** 2 months–12 years, usual dose 11–14 micrograms/kg/minute

**Mivacuron®**  
**(GSK)**

**Injection**, mivacurium (as chloride) 2 mg/mL, net price 5-mL amp = £2.79; 10-mL amp = £4.51

**PANCURONIUM BROMIDE**

**Indications**  
neuromuscular blockade (long duration) for surgery or during intensive care

**Cautions**  
see notes above

**Hepatic impairment**  
possibly slower onset, higher dose requirement, and prolonged recovery time

**Renal impairment**  
use with caution; prolonged duration of block

**Pregnancy**  
see notes above

**Breast-feeding**  
see notes above

**Side-effects**  
see notes above

**Dose**  
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation, by **intravenous injection**, **ADULT** and **CHILD** over 1 month, initially 100 micrograms/kg then 20 micrograms/kg as required, **NEONATE** see **BNF for Children**

**Intensive care, by **intravenous injection**, initially 100 micrograms/kg (optional) then 60 micrograms/kg every 60–90 minutes

**Pancuronium**  
**(Non-proprietary)**

**Injection**, pancuronium bromide 2 mg/mL, net price 2-mL amp = £1.20
### Rocuronium Bromide

**Indications**
neuromuscular blockade (intermediate duration) for surgery or during intensive care

**Cautions**
see notes above

**Hepatic Impairment**
reduce dose

**Renal Impairment**
reduce maintenance dose; prolonged paralysis

**Pregnancy**
see notes above

**Breast-feeding**
see notes above

**Side-effects**
see notes above

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation, **ADULT** and **CHILD** over 1 month, **by intravenous injection**, initially 600 micrograms/kg; maintenance by **intravenous injection**, 150 micrograms/kg (**ELDERLY** 75–100 micrograms/kg) or maintenance by **intravenous infusion**, 300–600 micrograms/kg/hour (**ELDERLY** up to 400 micrograms/kg/hour) adjusted according to response

- Intensive care, **by intravenous injection**, **ADULT** initially 600 micrograms/kg (optional); maintenance by **intravenous infusion**, 300–600 micrograms/kg/hour for first hour, then adjusted according to response

**Rocuronium** (Non-proprietary)

**Injection**, rocuronium bromide 10 mg/mL, net price 5-mL vial = £3.00, 10-mL vial = £6.00

**Esmeron** (Organon)

**Injection**, rocuronium bromide 10 mg/mL, net price 5-mL vial = £2.90, 10-mL vial = £5.79

### Vecuronium Bromide

**Indications**
neuromuscular blockade (intermediate duration) for surgery

**Cautions**
see notes above

**Hepatic Impairment**
use with caution in significant impairment

**Renal Impairment**
use with caution in renal failure

**Pregnancy**
see notes above

**Breast-feeding**
see notes above

**Side-effects**
see notes above

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- **ADULT** and **CHILD** over 1 month, **by intravenous injection**, 80–100 micrograms/kg; then maintenance, **by intravenous injection either 20–30 micrograms/kg** adjusted according to response (max. 100 micrograms/kg in caesarian section), or **by intravenous infusion**, 0.8–1.4 micrograms/kg/minute, adjusted according to response; **NEONATE** see BNF for Children

**Norcuron** (Organon)

**Injection**, powder for reconstitution, vecuronium bromide, net price 10-mg vial = £3.38 (with water for injections)

### Suxamethonium Chloride

(Succinylcholine chloride)

**Indications**
neuromuscular blockade (short duration)

**Cautions**
see notes above: hypersensitivity to other neuromuscular blocking drugs; patients with cardiac, respiratory, or neuromuscular disease; raised intracocular pressure (avoid in penetrating eye injury); severe sepsis (risk of hyperkalaemia); interactions: Appendix 1 (muscle relaxants)

**Contra-indications**
family history of malignant hyperthermia, hyperkalaemia; major trauma, severe burns, neurological disease involving acute wasting of major muscle, prolonged immobilisation—risk of hyperkalaemia, personal or family history of congenital myotonic disease, Duchenne muscular dystrophy, low plasma-cholinesterase activity (including severe liver disease, see Hepatic Impairment)

**Hepatic Impairment**
prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase

**Pregnancy**
mildly prolonged maternal neuromuscular blockade may occur

**Breast-feeding**
unlikely to be present in breast milk in significant amounts (ionised at physiological pH); breast-feeding may be resumed once the mother recovered from neuromuscular block

**Side-effects**
see notes above; also increased gastric pressure; hyperkalaemia; postoperative muscle pain, myoglobinuria, myoglobinemia; increased intraocular pressure; flushing, rash; rarely arrhythmias, cardiac arrest; bronchospasm, apnoea, prolonged

### Depolarising neuromuscular blocking drugs

Suxamethonium has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation.

Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium and is caused by the development of a non-depolarising block following the initial depolarising block; edrophonium (section 15.1.6) may be used to confirm the diagnosis of dual block. Individuals with myasthenia gravis are resistant to suxamethonium but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.
15.1.6 Drugs for reversal of neuromuscular blockade

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium.

Edrophonium has a transient action and may be used in the diagnosis of suspected dual block due to suxamethonium. Atropine (section 15.1.3) is given before or with edrophonium to prevent muscarinic effects when given for reversal of non-depolarising neuromuscular blockade.

Neostigmine has a longer duration of action than edrophonium and is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium or alternatively atropine (section 15.1.3), given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

EDROPHONIUM CHLORIDE

Indications see under Dose; myasthenia gravis (section 10.2.1)

Cautions section 10.2.1; atropine should also be given

Contra-indications section 10.2.1

Pregnancy section 10.2.1

Breast-feeding section 10.2.1

Side-effects section 10.2.1

Dose

• Brief reversal of non-depolarising neuromuscular block by intravenous injection over several minutes, 500–700 micrograms/kg (after or with atropine)

• Diagnosis of dual block, by intravenous injection, 10 mg

NEOSTIGMINE METILSULFATE

(NEostigmine methylsulphate)

Indications see under Dose

Cautions section 10.2.1 and notes above; glycopyrronium or atropine should also be given

Contra-indications section 10.2.1 and notes above

Pregnancy section 10.2.1

Breast-feeding section 10.2.1

Side-effects section 10.2.1 and notes above

Dose

• Reversal of non-depolarising neuromuscular blockade, by intravenous injection over 1 minute, ADULT over 18 years, 2.5 mg repeated if necessary (max. 5 mg) after or with glycopyrronium or atropine; CHILD under 18 years see BNF for Children

• Myasthenia gravis, see section 10.2.1

Neostigmine (Non-proprietary) Injection, neostigmine metilsulfate 2.5 mg/mL, net price 1-mL amp = 58p

With glycopyrronium bromide

Glycopyrronium–Neostigmine (Non-proprietary) Injection, neostigmine metilsulfate 2.5 mg, glycopyrronium bromide 500 micrograms/mL, net price 1-mL amp = 91p

Dose reversal of non-depolarising neuromuscular blockade, by intravenous injection over 10–30 seconds, 1–2 mL or 0.02 mL/kg, dose may be repeated if required (total max. 2 mL); CHILD 0.02 mL/kg (or 0.2 mL/kg of a 1 in 10 dilution using water for injections or sodium chloride injection 0.9%), dose may be repeated if required (total max. 2 mL)

Other drugs for reversal of neuromuscular blockade

Sugammadex is a modified gamma cyclodextrin used for reversal of neuromuscular blockade induced by rocuronium or vecuronium (section 15.1.5).

SUGAMMADEX

Indications reversal of neuromuscular blockade induced by rocuronium or vecuronium

Cautions recurrence of neuromuscular blockade—monitor respiratory function until fully recovered; recovery may be delayed in cardiovascular disease and elderly; pre-existing coagulation disorders or use of anticoagulants (unrelated to surgery); wait 24 hours before re-administering rocuronium or vecuronium; interactions: Appendix 1 (sugammadex)

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy use with caution—no information available

Side-effects taste disturbances; less commonly allergic reactions; bronchospasm also reported
15.1.7 Antagonists for central and respiratory depression

**Dose**
- Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium, by intravenous injection. **ADULT** over 18 years, 2–4 mg/kg (consult product literature); a further dose of 4 mg/kg may be required if recurrence of neuromuscular blockade occurs.
- Routine reversal of neuromuscular blockade induced by rocuronium, by intravenous injection. **CHILD** 2–18 years, 2 mg/kg (consult product literature).
- Immediate reversal of neuromuscular blockade induced by rocuronium, by intravenous injection. **ADULT** over 18 years, 16 mg/kg (consult product literature).

**Indications**
- Flumazenil (Non-proprietary). Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £14.49.

**Anexate® (Roche)** Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £13.66.

**Breast-feeding**
- Avoid unless potential benefit outweighs risk.

**Side-effects**
- Nausea, vomiting, and flushing; if waking too rapid, agitation, anxiety, and fear; transient increase in blood pressure and heart-rate in intensive care patients; very rarely convulsions (particularly in those with epilepsy), hypersensitivity reactions including anaphylaxis.

**Dose**
- Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium, by intravenous injection. **ADULT** over 18 years, 2–4 mg/kg (consult product literature).
- Immediate reversal of neuromuscular blockade induced by rocuronium, by intravenous injection. **ADULT** over 18 years, 16 mg/kg (consult product literature).

**Bridion® (Scherling-Plough)** Injection, sugammadex (as sodium salt) 100 mg/mL, net price 2-mL amp = £59.64, 5-mL amp = £149.10.

**Electrolytes** Na⁺ 0.42 mmol/mL

**Breast-feeding**
- Avoid breast-feeding for 24 hours.

**Pregnancy**
- Use only if potential benefit outweighs risk.

**Side-effects**
- Nausea, vomiting; hypotension, hypertension, tachycardia and fibrillation, cardiovascular arrest; hyperventilation, dyspnoea, pulmonary oedema; headache, dizziness; less commonly diarrhoea, dry mouth, agitation, excitement, paraesthesia, tremor, sweating; very rarely seizures, erythema multiforme, and hypersensitivity reactions including anaphylaxis.

**Dose**
- By intravenous injection, 200 micrograms over 15 seconds, then 100 micrograms at 60-second intervals if required; usual dose range, 300–600 micrograms; max. total dose 1 mg (2 mg in intensive care); question aetiology if no response to repeated doses.
- By intravenous infusion, if drowsiness recurs after injection, 100–400 micrograms/hour, adjusted according to level of arousal.

**Indications**
- Respiratory depression is a major concern with opioid anaesthetics and it may be treated by artificial ventilation or be reversed by naloxone. Naloxone will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone; however, naloxone will also antagonise the analgesic effect.

**Flumazenil** is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than naloxone; however, naloxone will also antagonise the analgesic effect.

**Doxapram** (section 3.5.1) is a central and respiratory stimulant but is of limited value in anaesthesia.
Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium should be avoided during anaesthesia in patients at high risk of malignant hyperthermia. Dantrolene is used in the treatment of malignant hyperthermia. It acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

**DANTROLENE SODIUM**

**Indications** malignant hyperthermia; chronic severe spasticity of voluntary muscle (section 10.2.2)

**Cautions** avoid extravasation (risk of tissue necrosis);

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** present in milk—use only if potential benefit outweighs risk

**Side-effects** hepatotoxicity, pulmonary oedema, dizziness, weakness, and injection-site reactions including erythema, rash, swelling, and thrombophlebitis

**Dose**

- By rapid intravenous injection, ADULT, initially 2–3 mg/kg, then 1 mg/kg repeated as required to a cumulative max. of 10 mg/kg; CHILD 1 month–18 years see BNF for Children

**Dantrolium Intravenous®** (SpePharm) 

**Injection**, powder for reconstitution, dantrolene sodium, net price 20-mg vial = £5.00 (hosp. only)

---

**Use of local anaesthetics** Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

**Administration** The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient’s age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity. Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so **careful surveillance** for toxic effects (see Toxicity and Side-effects, below) is necessary during the first 30 minutes after injection.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential (e.g. major thoracic or intra-abdominal surgery).

**Use of vasoconstrictors** Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline (epinephrine) to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline, and it is not advisable to give adrenaline with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline must be used in a low concentration when administered with a local anaesthetic (but see also Dental Anaesthesia, below). The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products. For prescribing information on adrena-
line, see section 2.7.3. For drug interactions of adrenaline, see Appendix 1 (sympathomimetics).

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

**Dental anaesthesia** Lidocaine is widely used in dental procedures; it is most often used in combination with adrenaline (epinephrine). Lidocaine 2% combined with adrenaline 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline. See also Use of Vasoconstrictors, above.

The local anaesthetics articaine and mepivacaine are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine is available with or without adrenaline and articaine is available with adrenaline.

**Cautions of local anaesthetics** Local anaesthetics should be administered with caution in children, elderly or debilitated patients (consider dose reduction), or in patients with impaired cardiac conduction, cardiovascular disease, hypovolaemia, shock, impaired respiratory function, epilepsy, or myasthenia gravis. See also Administration and Use of Vasoconstrictors, above.

**Contra-indications of local anaesthetics** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. In such circumstances, increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH. See also Use of Vasoconstrictors, above.

**Toxicity and side-effects** A single application of a topical lidocaine preparation does not generally cause systemic side-effects. Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. CNS effects include a feeling of inebriation and lightheadedness followed by sedation, numbness of the tongue and perioral region, restlessness, paraesthesia (including sensations of hot and cold), dizziness, blurred vision, nausea and vomiting, muscle twitching, tremors, and convulsions. Transient excitation may also occur, followed by depression with drowsiness, respiratory failure, unconsciousness, and coma. Effects on the cardiovascular system include myocardial depression and peripheral vasodilatation resulting in hypotension and bradycardia; arrhythmias and cardiac arrest can occur. Hypersensitivity reactions occur mainly with the ester-type local anaesthetics such as tetracaine; reactions are less frequent with the amide types such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**Articaine** Articaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, above). It is available in a preparation that also contains adrenaline (see Use of Vasoconstrictors, p. 793).

**ARTICAIN HYDROCHLORIDE WITH ADRENALINE** (Carticaine hydrochloride with adrenaline)

**Indications** infiltration anaesthesia in dentistry

**Cautions** see Cautions of Local Anaesthetics, above and Adrenaline, section 2.7.3

**Contra-indications** see Contra-indications of Local Anaesthetics, above and Adrenaline, section 2.7.3

**Hepatic impairment** use with caution; increased risk of side-effects in severe impairment

**Renal impairment** see Adrenaline, section 2.7.3

**Pregnancy** use only if potential benefit outweighs risk—no information available

**Breast-feeding** avoid breast-feeding for 48 hours after administration

**Side-effects** see Toxicity and Side-effects, above and Adrenaline, section 2.7.3; also methaemoglobinaemia (see Prilocaine (p. 797) for treatment)

**Dose**

- **ADULT and CHILD** over 4 years, consult expert dental sources

**Septanest®** (Septodont)®

**Injection**, articaine hydrochloride 40 mg/mL, adrenaline 1 in 200 000 (5 micrograms/mL), net price 2.2-mL cartridge = 41p

**Injection**, articaine hydrochloride 40 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 41p

**Bupivacaine**

Bupivacaine has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

**BUPIVACAINE HYDROCHLORIDE**

**Indications** see under Dose

**Cautions** see Cautions of Local Anaesthetics, above; myocardial depression may be more severe and more...
resistant to treatment; cardiovascular disease; hypertension; hypoponnia; cerebral atheroma; interactions: Appendix 1 (bupivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 794

Hepatic impairment caution in severe impairment

Renal impairment caution in severe impairment

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after paracervical or epidural block; use lower doses for intrathecal use during late pregnancy

Breast-feeding amount too small to be harmful

Side-effects see Toxicity and Side-effects, p. 794

Dose

Note Doses should be adjusted according to patient's physical status and nature of procedure—important: see also under Administration, p. 793

- Local infiltration, max. 60 mL, using a 2.5 mg/mL (0.25%) solution
- Peripheral nerve block, max. 60 mL (150 mg), using a 2.5 mg/mL (0.25%) solution; max. 30 mL, using a 5 mg/mL (0.5%) solution
- Epidural block
  - Surgery, lumbar, 10–20 mL (50–100 mg), using a 5 mg/mL (0.5%) solution
  - Surgery, caudal, 15–30 mL (75–150 mg), using a 5 mg/mL (0.5%) solution; CHILD (up to 10 years) using a 2.5 mg/mL (0.25%) solution, upper to lower-thoracic (T10) 0.3–0.4 mL/kg (0.75–1 mg/kg), up to mid-thoracic (T6) 0.4–0.8 mL/kg (1–2 mg/kg)
  - Labour, lumbar, 6–12 mL (15–30 mg) using a 2.5 mg/mL (0.25%) or 6–12 mL (30–60 mg) using a 5 mg/mL (0.5%) solution
- Sympathetic block, 20–50 mL (50–125 mg), using a 2.5 mg/mL (0.25%) solution
- Intrathecal anaesthesia, see under preparations

Important The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

Bupivacaine (Non-proprietary) 

Injection, anhydrous bupivacaine hydrochloride

2.5 mg/mL (0.25%), net price 10 mL = 82p; 5 mg/mL (0.5%), 10 mL = 94p

Infusion, anhydrous bupivacaine hydrochloride

1 mg/mL (0.1%), net price 100 mL = £8.41; 250 mL = £10.59; 1.25 mg/mL (0.125%), 250 mL = £10.80

Note continuous lumbar epidural infusion during labour (once epidural block established), 10–15 mg/hour of 0.1% or 0.125% solution; max. 2 mg/kg over 4 hours and total of 400 mg in 24 hours

Continuous thoracic, upper abdominal, or lower abdominal epidural infusion for postoperative pain (once epidural block established), 4–15 mg/hour of 0.1% solution, or 5–15 mg/hour of 0.125% solution; max. 2 mg/kg over 4 hours and total of 400 mg in 24 hours; not recommended for use in children

Marclain® (AstraZeneca) 

Injection, anhydrous bupivacaine hydrochloride

2.5 mg/mL (Marclain® 0.25%), net price 10 mL; Polyamp® = £1.06; 5 mg/mL (Marclain® 0.5%), 10 mL Polyamp® = £1.21

Levobupivacaine 

Levobupivacaine, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine, but is thought to have fewer adverse effects.

LEVOBUPIVACAINE 

Note Levobupivacaine is an isomer of bupivacaine

Indications see under Dose

Cautions see Cautions of Local Anaesthetics, p. 794; cardiovascular disease; interactions: Appendix 1 (levobupivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 794

Hepatic impairment use with caution

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid if possible in the first trimester—toxicity in animal studies; may cause fetal distress syndrome; do not use for paracervical block in obstetrics; do not use 7.5 mg/mL strength in obstetrics

Breast-feeding amount too small to be harmful

Side-effects see Toxicity and Side-effects, p. 794; also sweating, pyrexia, and anaemia

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

Note Doses should be adjusted according to patient's physical status and nature of procedure—important: see also under Administration, p. 793

- Surgical anaesthesia
  - Lumbar epidural, 10–20 mL (50–150 mg) of 5 mg/mL or 7.5 mg/mL solution over 5 minutes; caesarean section, 15–30 mL (75–150 mg) of 5 mg/mL solution over 15–20 minutes
  - Intrathecal, 3 mL (15 mg) of 5 mg/mL solution
- Peripheral nerve block, 1–40 mL of 2.5 mg/mL or 5 mg/mL solution (max. 150 mg); ilioinguinal/iliohypogastric block, CHILD under 12 years 0.25–0.5 mL/kg (0.625–2.5 mg/kg) of a 2.5 mg/mL or 5 mg/mL solution
- Peribulbar block, 5–15 mL (37.5–112.5 mg) of 7.5 mg/mL solution
- Local infiltration, 1–60 mL (max. 150 mg) of 2.5 mg/mL solution
15.2 Local anaesthesia

**Lidocaine**

Lidocaine is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline) is about 90 minutes.

**LIDOCAINE HYDROCHLORIDE** (Lignocaine hydrochloride)

**Indications** see under Dose; ventricular arrhythmias (section 2.3.2); eye (section 11.7)

**Cautions** See Cautions of Local Anaesthetics, p. 794 and section 2.3.2; hypertension; topical preparations can damage plastic cuffs of endotracheal tubes

**Contra-indications** see notes above, Contra-indications of Local Anaesthetics, p. 794, and section 2.3.2

**Hepatic impairment** section 2.3.2

**Renal impairment** section 2.3.2

**Pregnancy** large doses can cause fetal bradycardia; large doses during delivery can cause neonatal respiratory hypotonia, hypotonia, or bradycardia after paracervical or epidural block

**Breast-feeding** section 2.3.2

**Side-effects** see Toxicity and Side-effects, p. 794 and section 2.3.2; also methaemoglobinemia (see below Prilocaine (p. 797) for treatment), nystagmus, rash; hypoglycaemia also reported following intrathecal or extradural administration

**Dose**

- **To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight**
- **Infiltration anaesthesia, according to patient’s weight and nature of procedure, max. 200 mg (or 500 mg if given in solutions containing adrenaline)—see also Administration on p. 793 and see also important warning below**

**Important**

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

**Lidocaine hydrochloride injections**

Lidocaine (Non-proprietary) \(^{(a)}\)

**Injection**, lidocaine hydrochloride 5 mg/mL (0.5%), net price 10-mL amp = £1.62; 5 mg/mL, 10-mL amp = £1.62; 7.5 mg/mL, 10-mL amp = £2.43

**Note** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%

**Infusion**, lepovupicaine (as hydrochloride) 625 micrograms/mL, net price 100 mL = £6.63, 200 mL = £10.37, 1.25 mg/mL, net price 100 mL = £7.26, 200 mL = £12.20

**With adrenaline**

For prescribing information on adrenaline see section 2.7.3; see also Use of Vasoconstrictors, p. 793.

**Xylocaine** (AstraZeneca) \(^{(a)}\)

**Injection**, anhydrous lidocaine hydrochloride 10 mg/mL (1%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = 99p

**Injection**, anhydrous lidocaine hydrochloride 20 mg/mL (2%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.04

**Lidocaine for surface anaesthesia**

Instillagel\(^{(a)}\) (CliniMed)

**Gel**, lidocaine hydrochloride 2%, chlorhexidine gluconate solution 0.25%, in a sterile lubricant basis in disposable syringe, net price 6-mL syringe = £1.41, 11-mL syringe = £1.58

**Excipients** include hydroxybenzoates (parabens)

**Dose** urethral sounding and catheterisation, 6–11 mL into urethra

Cystoscopy, 11 mL (a further instillation of 6–11 mL may be required)

**Laryngojet** (UCB Pharma) \(^{(a)}\)

**Solution**, lidocaine hydrochloride 40 mg/mL (4%), net price per unit (4-mL vial and disposable sterile cannula with cover and vial injector) = £5.10

**Dose** anaesthesia of oropharynx, trachea, or respiratory tract, 40–200 mg (1–5-mL) as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient); usual dose 160 mg (4 mL), CHILD up to 3 mg/kg

**LMX 4** (Femdale)

**Cream** lidocaine 4 %, net price 5-g tube = £2.98; 5 × 5-g tube with 10 occlusive dressings = £16.00

**Excipients** include benzyl alcohol and propylene glycol

**Dose** ADULT and CHILD over 1 month, anaesthesia before venous cannulation or venepuncture, apply thick layer (1–2.5 g); CHILD under 1 year max. 1 g) to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure (max. 60 minutes); remove cream with gauze and perform procedure after approximately 5 minutes

---

**Acute pain**

Lumbar epidural, labour pain, 6–10 mL (15–25 mg) of 2.5 mg/mL solution at intervals of at least 15 minutes or 5–12.5 mg/hour as a continuous epidural infusion; postoperative pain, 12.5–18.75 mg/hour as a continuous epidural infusion; max. 400 mg in 24 hours
**Versatis** (Grunenthal) (SM)

**Plasters**, lidocaine 5% (700 mg/medicated plaster), net price 30 = £72.40

**Excipients** include hydroxybenzoates (parabens), propylene glycol

**Dose** postoperative neuraxial, ADULT over 18 years, apply to intact, dry, non-hairy, non-irritated skin once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks

**Note** Up to 3 plasters may be used to cover large areas; plasters may be cut

**The Scottish Medicines Consortium** (p. 4) has advised (July 2008) that Versatis® is accepted for restricted use within NHS Scotland for the treatment of postoperative neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective

**Xylocaine** (AstraZeneca)

**Spray**, lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/dose; 500 spray doses per container, net price 50-mL bottle = £3.13

**Dose** dental practice, 1–5 doses

Maxillary sinus puncture, 3 doses

During delivery in obstetrics, up to 20 doses

Bronchoscopy, laryngoscopy, oesophagoscopy, endotracheal intubation, up to 20 doses; CHILD up to 3 mg/kg

### With prilocaine

For prescribing information on prilocaine, see below

**EMLA** (AstraZeneca)

**Cream**, lidocaine 2.5%, prilocaine 2.5%, net price 5-g tube = £1.73; 30-g tube (surgical pack) = £10.25; 5-g tube with 12 occlusive dressings (premedication pack) = £9.75

**Dose** ADULT and CHILD over 1 year, anaesthesia before minor skin procedures including venepuncture, apply thick layer under occlusive dressing 1–3 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting); max. 2 doses in 24 hours for CHILD 1–12 years; CHILD under 3 months or body-weight less than 5 kg, apply max. 1 g under occlusive dressing for max. 1 hour before procedure; max. 1 dose in 24 hours. CHILD 3–12 months and body-weight over 5 kg, apply max. 2 g under occlusive dressing for max. 4 hours before procedure; max. 2 doses in 24 hours

**Note** Shorter application time of 15–30 minutes is recommended for children with atopic dermatitis

Anaesthesia on genital skin before injection of local anaesthetics in adult men, apply under occlusive dressing for 15 minutes

Anaesthesia before surgical treatment of lesions on genital mucosa in adults, apply up to 10 g 5–10 minutes before procedure

### With adrenaline

For prescribing information on adrenaline, see section 2.7.3: see also Use of Vasoconstrictors, p. 793.

**Scandonest** 3% Plain (Septodont) (SM)

**Injection**, mepivacaine hydrochloride 30 mg/mL, net price 2.2-mL cartridge = 36p

### Prilocaine

**Prilocaine** is a local anaesthetic of low toxicity which is similar to lidocaine. If used in high doses, methaemoglobinemia may occur which can be treated with an intravenous injection of methylthioninium chloride 1% using a dose of 1–2 mg/kg given over 5 minutes. The dose may be repeated after 30–60 minutes if no response. Infants under 6 months are particularly susceptible to methaemoglobinemia. A hyperbaric solution of prilocaine (containing glucose) may be used for spinal anaesthesia.

**Lidocaine for ear, nose, and oropharyngeal use**

For prescribing information on phenylephrine, see section 2.7.2

**Lidocaine with phenylephrine** (Non-proprietary)

**Topical solution**, lidocaine hydrochloride 5%, phenylephrine hydrochloride 0.5%, net price 2.5 mL (with nasal applicator) = £9.98

**Dose** anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose, ADULT and CHILD over 12 years, up to max. 8 sprays

**Mepivacaine**

Mepivacaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, p. 794).
bradycardia after epidural block; avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported); use lower doses for intrathecal use during late pregnancy

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** see notes above and Toxicity and Side-effects, p. 794; also hypertension, pyrexia; less commonly syncope, and hypothermia

**Dose**

| **To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight** |

- See under preparations—**important**: see also Administration, p. 793

**Citanest 1%** (AstraZeneca)

- **Injection**, prilocaine hydrochloride 10 mg/mL, net price 50-mL multidose vial = £2.01
- **Dose** infiltration anaesthesia and nerve block, adjusted according to site of administration and response, 100–200 mg/minute, or in incremental doses, to max. total dose 400 mg (dose may need to be reduced in ELDERLY or debilitated patients). **CHILD** over 6 months up to 5 mg/kg

**Prilocetak** (Goldshield)

- **Injection**, prilocaine hydrochloride 20 mg/mL (2%), glucose 60 mg/mL, net price 5-mL amp = £7.80
- **Dose** intrathecal anaesthesia, **ADULT** over 18 years, usually 40–60 mg, max. 80 mg (dose may need to be reduced in ELDERLY or debilitated patients, or in late pregnancy)

**With lidocaine**
See Lidocaine, p. 797

**For dental use**

- Note Consult expert dental sources for specific advice in relation to dose of prilocaine for dental anaesthesia.

**Citanest 4%** (Dentsply)

- **Injection**, prilocaine hydrochloride 40 mg/mL, net price 2.2-mL cartridge = 17p

**Citanest 3% with Octapressin** (Dentsply)

- **Injection**, prilocaine hydrochloride 30 mg/mL, felypressin 0.03 unit/mL, net price 2.2-mL cartridge and self-aspirating cartridge (both) = 47p

**Ropivacaine**

Ropivacaine is an amide-type local anaesthetic agent similar to bupivacaine. It is less cardiotonic than bupivacaine, but also less potent.

**ROPIVACAINE HYDROCHLORIDE**

**Indications** see under Dose

**Cautions** see Cautions of Local Anaesthetics, p. 794; also acute porphyria (section 9.8.2); **interactions**: Appendix 1 (ropivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 794

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** caution in severe impairment; increased risk of systemic toxicity in chronic renal failure

**Pregnancy** not known to be harmful; do not use for paracervical block in obstetrics

**Breast-feeding** not known to be harmful

**Side-effects** see Toxicity and Side-effects, p. 794; also hypertension, pyrexia; less commonly syncope, and hypothermia

**Dose**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- **Note** Doses should be adjusted according to patient’s physical status and nature of procedure—**important** see also under Administration, p. 793

- **Surgical anaesthesia**

  **Lumbar epidural**, **ADULT** and **CHILD** over 12 years, 15–20 mL (150–200 mg) of 10 mg/mL solution or 15–25 mL (113–188 mg) of 7.5 mg/mL solution; caesarean section, 15–20 mL (113–150 mg) of 7.5 mg/mL solution in incremental doses

  **Thoracic epidural** (to establish block for postoperative pain), **ADULT** and **CHILD** over 12 years, 5–15 mL (38–113 mg) of 7.5 mg/mL solution

  **Major nerve block** (brachial plexus block), **ADULT** and **CHILD** over 12 years, 30–40 mL (225–300 mg) of 7.5 mg/mL solution

  **Field block**, **ADULT** and **CHILD** over 12 years, 1–30 mL (7.5–225 mg) of 7.5 mg/mL solution

- **Acute pain using 2 mg/mL solution**

  **Lumbar epidural**, **ADULT** and **CHILD** over 12 years, 10–20 mL (20–40 mg) followed by 10–15 mL (20–30 mg) at intervals of at least 30 minutes or 6–10 mL/hour (12–20 mg/hour) as a continuous epidural infusion for labour pain or 6–14 mL/hour (12–28 mg/hour) as a continuous epidural infusion for postoperative pain

  **Thoracic epidural**, **ADULT** and **CHILD** over 12 years, 6–14 mL/hour (12–28 mg/hour) as a continuous infusion

  **Field block**, **ADULT** and **CHILD** over 12 years, 1–100 mL (2–200 mg)

- **Peripheral nerve block**, **ADULT** and **CHILD** over 12 years, 5–10 mL/hour (10–20 mg/hour) as a continuous infusion or by intermittent injection

- **CHILD** under 12 years, consult product literature

**Ropivacaine** (Non-proprietary)

- **Infusion**, ropivacaine hydrochloride 2 mg/mL, net price 200-mL = £14.45

**Naropin** (AstraZeneca)

- **Injection**, ropivacaine hydrochloride 2 mg/mL, net price 10-mL **Polyamp** = £1.78; 7.5 mg/mL, 10-mL **Polyamp** = £2.65; 10 mg/mL, 10-mL **Polyamp** = £3.20

  **Electrolytes** Na⁺ = 0.5 mmol/mL

- **Infusion**, ropivacaine hydrochloride 2 mg/mL, net price 200-mL **Polybag** = £14.45

  **Electrolytes** Na⁺ = 0.5 mmol/mL

**Tetracaine**

Tetracaine is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine is a safer alternative.
**TETRACAINE**  
(Amethocaine)

**Indications**  see under preparation; eye (section 11.7)  
**Cautions**  see Cautions of Local Anaesthetics, p. 794  
**Contra-indications**  see Contra-indications of Local Anaesthetics, p. 794  
**Breast-feeding**  not known to be harmful  
**Side-effects**  see Toxicity and Side-effects, p. 794  
**Important**  Rapid and extensive absorption may result in systemic side-effects (see also notes above)

**Ametop®** (S&N Hlth.)  
**Gel**, tetracaine 4%, net price 1.5-g tube = £1.08  
**Dose**  ADULT and CHILD over 1 month, apply contents of tube to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation;  
**NEONATE**  see BNF for Children  
**Note**  ADULT and CHILD over 5 years, contents of max. 5 tubes applied at separate sites at a single time; CHILD 1 month–5 years, contents of max. 1 tube applied at separate sites at a single time
Appendix 1: Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs, p. 12), as for other adverse drug reactions.

Drug interactions may be pharmacodynamic or pharmacokinetic.

**Pharmacodynamic interactions**

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

**Pharmacokinetic interactions**

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar. Pharmacokinetic interactions are of several types:

**Affecting absorption**

The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

**Due to changes in protein binding**

To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination. Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

**Affecting metabolism**

Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives. Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of in-vitro information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

**Affecting renal excretion**

Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

**Relative importance of interactions**

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antiadibiotics) are most often involved. Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function.

**Serious interactions**

The symbol • has been placed against interactions that are potentially serious and where combined administration of the drugs involved should be avoided (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.
Appendix 1: Interactions

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts; changes in the interactions lists since BNF No. 60 (September 2010) are underlined.

For explanation of symbol • see above

Abacavir

Analgesics: abacavir possibly reduces plasma concentration of methadone

Antibacterials: plasma concentration of abacavir possibly reduced by rifampicin

Antiepileptics: plasma concentration of abacavir possibly reduced by phenytoin

Anti-infectives: abacavir possibly reduces effects of etabaumol; plasma concentration of abacavir reduced by eiprocarb

Barbiturates: plasma concentration of abacavir possibly reduced by phenobarbital

Abatacept

Adalimumab: increased risk of side-effects when abatacept given with adalimumab

Cetolizumab pegol: avoid concomitant use of abatacept with cetolizumab pegol

Etanercept: avoid concomitant use of abatacept with etanercept

Golimumab: avoid concomitant use of abatacept with golimumab

Infliximab: avoid concomitant use of abatacept with infliximab

Vaccines: avoid concomitant use of abatacept with live vaccines (see p. 746)

Acarbose see Antidiabetics

ACE Inhibitors

Alcohol: enhanced hypotensive effect when ACE inhibitors given with alcohol

Aldesleukin: enhanced hypotensive effect when ACE inhibitors given with aldesleukin

Allopurinol: increased risk of leucopenia and hypersensitivity reactions when ACE inhibitors given with allopurinol especially in renal impairment

Alpha-blockers: enhanced hypotensive effect when ACE inhibitors given with alpha-blockers

Anasthetics: General: enhanced hypotensive effect when ACE inhibitors given with general anaesthetics

Analgesics: increased risk in renal impairment when ACE inhibitors given with NSAIDs, also hypotensive effect antagonised

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ACE inhibitors given with angiotensin-II receptor antagonists

Antacids: absorption of ACE inhibitors possibly reduced by antacids: absorption of captopril, enalapril and fosinopril reduced by antacids

Antibacterials: plasma concentration of active metabolite of imidapril reduced by rifampicin (reduced antihypertensive effect); quinapril tablets reduce absorption of tetracyclines (quinapril tablets contain magnesium carbonate); possible increased risk of hyperkalaemia when ACE inhibitors given with trimethoprim

Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with anticoagulants

Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by MAOIs

Antidiabetics: ACE inhibitors possibly enhance hypo-glycaemic effect of insulin, metformin and sulfonylureas

Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with antipsychotics

Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with anxiolytics and hypnotics

Azathioprine: increased risk of anaemia or leucopenia when captopril given with azathioprine especially in ACE inhibitors

ACE Inhibitors

Azathioprine (continued) renal impairment; increased risk of anaemia when enalapril given with azathioprine especially in renal impairment

Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with beta-blockers

Calcium-channel blockers: enhanced hypotensive effect when ACE inhibitors given with calcium-channel blockers

Cardiac Glycosides: captopril possibly increases plasma concentration of digoxin

Clonidine: enhanced hypotensive effect when ACE inhibitors given with clonidine

Clonidine: antihypertensive effect of captopril possibly delayed by previous treatment with clonidine

Corticosteroids: hypotensive effect of ACE inhibitors antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when ACE inhibitors given with diazoxide

Diuretics: enhanced hypotensive effect when ACE inhibitors given with diuretics; increased risk of severe hyperkalaemia when ACE inhibitors given with potassium-sparing diuretics and aldosterone antagonists (monitor potassium concentration with low-dose spironolactone in heart failure)

Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with levodopa

Lithium: ACE inhibitors reduce excretion of lithium (increased plasma concentration)

Methylprednisolone: enhanced hypotensive effect when ACE inhibitors given with methylprednisolone

Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with moxisylyte

Moxonidine: enhanced hypotensive effect when ACE inhibitors given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with baclofen or tizanidine

Nitrites: enhanced hypotensive effect when ACE inhibitors given with nitrites

Oestrogens: hypotensive effect of ACE inhibitors antagonised by oestrogens

Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with potassium salts

Probenecid: excretion of captopril reduced by probenecid

Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with prostaglandins

Sodium Aurothiomalate: flushing and hypertension reported when ACE inhibitors given with sodium aurothiomalate

Acetobutolol see Beta-blockers

Acelefontac see NSAIDs

Acemetacin see NSAIDs

Acmoocumaro see Coumarins

Acrizolamide see Diuretics

Aciclovir

Note: Interactions do not apply to topical aciclovir preparations

Note: Valaciclovir interactions as for aciclovir

Ciclosporin: increased risk of nephrotoxicity when aciclovir given with ciclosporin

Mycophenolate: plasma concentration of aciclovir increased by mycophenolate, also plasma concentration of inactive metabolite of mycophenolate increased

Probenecid: excretion of aciclovir reduced by probenecid (increased plasma concentration)

Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with tacrolimus

Theophylline: aciclovir possibly increases plasma concentration of theophylline
Appendix 1: Interactions

Adrenergic Neurone Blockers (continued)
Methylidopa: enhanced hypnotic effect when adrenergic neurone blockers given with methylidopa
Moxisylyte: enhanced hypnotic effect when adrenergic neurone blockers given with moxisylyte
Moxonidine: enhanced hypnotic effect when adrenergic neurone blockers given with moxonidine
Muscle Relaxants: enhanced hypnotic effect when adrenergic neurone blockers given with baclofen or tizanidine
Nitrites: enhanced hypnotic effect when adrenergic neurone blockers given with nitrates
Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by oestrogens
Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by pizotifen
Prostaglandins: increased risk of convulsions when alcohol given with prostaglandins
Vaccines: (see p. 746)
Antivirals: avoidance of adefovir advised by manufacturer of tenofovir
Anticoagulants: see Kaolin
Agalsidase Alfa and Beta
Anti-arrhythmics: effects of agalsidase alfa and beta possibly inhibited by amiodarone (manufacturers of agalsidase alfa and beta advise concomitant use)
Antibacterials: effects of agalsidase alfa and beta possibly inhibited by gentamicin (manufacturers of agalsidase alfa and beta advise concomitant use)
Antimalarials: effects of agalsidase alfa and beta possibly inhibited by chloroquine and hydroxychloroquine (manufacturers of agalsidase alfa and beta advise concomitant use)
Agomelatine
Antibacterials: manufacturer of agomelatine advises avoid concomitant use with ciprofloxacin
Antidepressants: metabolism of agomelatine inhibited by fluvoxamine (increased plasma concentration)
Antimalarials: avoidance of antidepressants advised by manufacturer of artesunate/malarone and some dealcoholised beverages contain tyramine
Alcohol
ACE Inhibitors: enhanced hypnotic effect when alcohol given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypnotic effect when alcohol given with adrenergic neurone blockers
Alpha-blockers: increased sedative effect when alcohol given with indoramol; enhanced hypnotic effect when alcohol given with alpha-blockers
Analgesics: enhanced hypnotic and sedative effects when alcohol given with opioid analgesics
Angiotensin-II Receptor Antagonists: enhanced hypnotic effect when alcohol given with angiotensin-II receptor antagonists
Antibacterials: disulfiram-like reaction when alcohol given with metronidazole; possibility of disulfiram-like reaction when alcohol given with tinidazole; increased risk of convulsions when alcohol given with cyclizine
Anticausalant: major changes in consumption of alcohol may affect anticalausal control with some beverages containing alcohol and some dealcoholised beverages contain tyramine which interacts with MAOIs (hypertensive crisis)—if no tyramine, enhanced hypnotic effect; sedative effects possibly increased when alcohol given with calcium-channel Blockers: enhanced hypnotic effect when alcohol given with calcium-channel blocke
Clomipramine: enhanced hypnotic effect when adrenergic neurone blockers given with clomipramine
Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by corticosteroids
Diazoxide: enhanced hypnotic effect when adrenergic neurone blockers given with diazoxide
Diuretics: enhanced hypnotic effect when adrenergic neurone blockers given with diuretics
Dopaminergics: enhanced hypnotic effect when adrenergic neurine blockers given with levodopa

Appendix 1: Interactions

Acitretin see Retinoids
Acrivastine see Antihistamines
Adalimumab
Abatacept: increased risk of side-effects when adalimumab given with abatacept
Anakinra: avoid concomitant use of adalimumab with anakinra
Vaccines: avoid concomitant use of adalimumab with live vaccines (see p. 746)
Adefovir
Antivirals: avoidance of adefovir advised by manufacturer of tenofovir
Adenosine
Note: Possibility of interaction with drugs tending to impair myocardial conduction
Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine
Anti-arrhythmics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with anti-arrhythmics that prolong the QT interval
Beta-blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers
Dipyridamole: effect of adenosine enhanced and extended by dipyridamole (important risk of toxicity)
Nicotine: effects of adenosine possibly enhanced by nicotine
Theophylline: anti-arrhythmic effect of adenosine antagonised by theophylline
Adrenaline (epinephrine) see Sympathomimetics

Adrenergic Neurone Blockers
Alcohol: enhanced hypnotic effect when adrenergic neurone blockers given with alcohol
Alpha-blockers: enhanced hypnotic effect when adrenergic neurone blockers given with alpha-blockers
Beta-blockers: increased hypnotic effect when adrenergic neurone blockers given with beta-blockers
Dipyridamole: effect of adenosine enhanced and extended by dipyridamole (important risk of toxicity)
Nicotine: effects of adenosine possibly enhanced by nicotine
Theophylline: anti-arrhythmic effect of adenosine antagonised by theophylline

Sympathomimetics see Antihistamines

802 Appendix 1: Interactions

BNF 61
Appendix 1: Interactions

Alcohol
- Antidepressants (continued)
  - SSRIs; increased sedative effect when alcohol given with mirtazapine, tricyclic-related
  - Antidepressants or tricyclics
  - Antidiabetics: alcohol enhances hypoglycaemic effect of antidiabetics; increased risk of lactic acidosis when alcohol given with metformin
  - Anti-infectives: alcohol possibly increases CNS side-effects of carbamazepine; chronic heavy consumption of alcohol possibly reduces plasma concentration of phenytoin; increased sedative effect when alcohol given with primidone
  - Antifungals: effects of alcohol possibly enhanced by griseofulvin
  - Antihistamines: increased sedative effect when alcohol given with antihistamines (possibly less effect with non-sedating antihistamines)
  - Antimuscarinicss: increased sedative effect when alcohol given with hyoscine
  - Antipsychotics: increased sedative effect when alcohol given with antipsychotics
  - Anxiolytics and Hypnotics: increased sedative effect when alcohol given with anxiolytics and hypnotics
  - Barbitalates: increased sedative effect when alcohol given with barbiturates
  - Beta-blockers: increased hypotensive effect when alcohol given with beta-blockers
  - Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with calcium-channel blockers; plasma concentration of alcohol possibly increased by verapamil
  - Clonidine: enhanced hypotensive effect when alcohol given with clonidine
  - Cytoxics: disulfiram-like reaction when alcohol given with procarbazine
  - Diazoxide: enhanced hypotensive effect when alcohol given with diazoxide
  - Disulfiram: disulfiram reaction when alcohol given with disulfiram (see p. 310)
  - Diuretics: enhanced hypotensive effect when alcohol given with diuretics
  - Dopaminergics: alcohol reduces tolerance to bromocriptine
  - Levamisole: possibility of disulfiram-like reaction when alcohol given with levamisole
  - Lofexidine: increased sedative effect when alcohol given with lofevidine
  - Methyldopa: enhanced hypotensive effect when alcohol given with methyldopa
  - Moxonidine: enhanced hypotensive effect when alcohol given with moxonidine
  - Muscle Relaxants: increased sedative effect when alcohol given with baclofen, methocarbamol or tizanidine
  - Nabilone: increased sedative effect when alcohol given with nabilone
  - Nicorandil: alcohol possibly enhances hypotensive effect of nicorandil
  - Natriotes: enhanced hypotensive effect when alcohol given with nitrates
  - Paraldehyde: increased sedative effect when alcohol given with paraldehyde
  - Retinoids: presence of alcohol causes etretinate to be formed from acitretin (increased risk of teratogenicity in women of child-bearing potential)
  - Sympathomimetics: alcohol possibly enhances effects of methylphenidate
  - Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with hydralazine, minoxidil or sodium nitroprusside

Aldesleukin
- ACE Inhibitors: increased risk of hypotensive effect when aldesleukin given with ACE inhibitors
  - Alpha-blockers: enhanced hypotensive effect when aldesleukin given with alpha-blockers

Aldesleukin (continued)
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with angiotensin-II receptor antagonists
  - Antivirals: aldesleukin possibly increases plasma concentration of indinavir
  - Beta-blockers: enhanced hypotensive effect when aldesleukin given with beta-blockers
  - Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with calcium-channel blockers
  - Clonidine: enhanced hypotensive effect when aldesleukin given with clonidine
  - Corticosteroids: manufacturer of aldesleukin advises avoid concomitant use with corticosteroids
  - Cytoxotics: manufacturer of aldesleukin advises avoid concomitant use with cisplatin, dacarbazine and etoposide
  - Diazoxide: enhanced hypotensive effect when aldesleukin given with diazoxide
  - Diuretics: enhanced hypotensive effect when aldesleukin given with diuretics
  - Methyl-α-dopa: enhanced hypotensive effect when aldesleukin given with methyl-α-dopa
  - Moxonidine: enhanced hypotensive effect when aldesleukin given with moxonidine
  - Natriotes: enhanced hypotensive effect when aldesleukin given with nitrates
  - Vasodilator Antihypertensives: enhanced hypotensive effect when aldesleukin given with hydralazine, minoxidil or sodium nitroprusside

Alendronic Acid see Bisphosphonates
- Alfentanil see Opioid Analgesics
- Alifuozin see Alpha-blockers
- Alimemazine see Antihistamines
- Aliskiren
  - Analgesics: hypotensive effect of aliskiren possibly antagonised by NSAIDs
  - Angiotensin-II Receptor Antagonists: plasma concentration of aliskiren possibly reduced by irbesartan
  - Anticoaugulants: increased risk of hyperkalaemia when aliskiren given with heparins
  - Antifungals: plasma concentration of aliskiren increased by ketoconazole
  - Calcium-channel Blockers: manufacturer of aliskiren advises avoid concomitant use with verapamil
  - Ciclosporin: plasma concentration of aliskiren increased by ciclosporin—avoid concomitant use
  - Diuretics: aliskiren reduces plasma concentration of furosemide; increased risk of hyperkalaemia when aliskiren given with potassium-sparing diuretics and aldosterone antagonists
  - Potassium Salts: increased risk of hyperkalaemia
  - When aliskiren given with potassium salts

Alitretinoin see Retinoids
- Alkylyating Drugs see Bendamustine, Busulfan, Carmustine, Cyclophosphamide, Eastrumustine, Ifosfamide, Lomustine, Melphalan, and Thiopeta
- Allopurinol
  - ACE Inhibitors: increased risk of leucopenia and hypersensitivity reactions when allopurinol given with ACE inhibitors especially in renal impairment
  - Antibacterialitls: increased risk of rash when allopurinol given with amoxicillin or ampicillin
  - Anticoaugulants: allopurinol possibly enhances anti-coagulant effect of coumarins
  - Antivirals: allopurinol increases plasma concentration of didanosine (risk of toxicity)—avoid concomitant use
  - Azathioprine: allopurinol enhances effects and increases toxicity of mercaptopurine (reduce dose of azathioprine to one quarter of usual dose)
  - Ciclosporin: allopurinol possibly increases plasma concentration of ciclosporin (risk of nephrotoxicity)
  - Cytoxotics: allopurinol enhances effects and increases toxicity of mercaptopurine (reduce dose of mercaptopurine to one quarter of usual dose);
### Appendix 1: Interactions

#### Alpha-blockers (continued)

Oestrogens: hypotensive effect of alpha-blockers antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when alpha-blockers given with alprostadil

Sildenafil: enhanced hypotensive effect when alpha-blockers given with sildenafil (avoid alpha-blockers for 4 hours after sildenafil)—see also p. 515

Sympathomimetics: avoid concomitant use of tolazoline with adrenaline (epinephrine) or dopamine

Tadalafil: enhanced hypotensive effect when alpha-blockers given with tadalafil—manufacturer of tadalafil advises avoid concomitant use

Ulcer-healing Drugs: effects of tolazoline antagonised by cimetidine and ranitidine

Vardenafil: enhanced hypotensive effect when alpha-blockers (excludes tamsulosin) given with vardenafil—separate doses by 6 hours—see also p. 515

### Alloprinol

- Cytotoxics (continued): avoidance of alloprinol advised by manufacturer of 5-acetabamine

#### Diuretics

- increased risk of hypersensitivity when alloprinol given with thiazides and related diuretics especially in renal impairment

#### Theophylline

- alloprinol possibly increases plasma concentration of theophylline

#### Almotriptan see SHT, Agonists

#### Alpha-adrenoceptor Stimulants see Apraclonidine, Brimonidine, Clonidine and Methylene

#### Alpha-blockers

- ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with ACE inhibitors

#### Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with adrenergic neurone blockers

#### Alcohol: enhanced hypotensive effect when alpha-blockers given with alcohol; increased sedative effect when indomarin given with alcohol

#### Aldesleukin: enhanced hypotensive effect when alpha-blockers given with aldesleukin

#### Alpha-blockers, General: enhanced hypotensive effect when alpha-blockers given with general anaesthetics

#### Analgesics: hypotensive effect of alpha-blockers antagonised by NSAIDs

#### Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with angiotensin-II receptor antagonists

#### Antihypertensives: enhanced hypotensive effect when alpha-blockers given with MAOIs; manufacturer of indomarin advises avoid concomitant use with MAOIs

#### Antifungals: plasma concentration of aluzofosin possibly increased by ketoconazole

#### Antipsychotics: enhanced hypotensive effect when alpha-blockers given with antipsychotics

#### Antidepressants: enhanced hypotensive effect when alpha-blockers given with antidepressants

#### Antiarrhythmics: enhanced hypotensive effect when alpha-blockers given with antiarrhythmics and Hypnotics

#### Beta-blockers: enhanced hypotensive effect when alpha-blockers given with beta-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

#### Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with calcium-channel blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

#### Cardiac Glycerides: prazosin increases plasma concentration of digoxin

#### Clonidine: enhanced hypotensive effect when alpha-blockers given with clonidine

#### Corticosteroids: hypotensive effect of alpha-blockers antagonised by corticosteroids

#### Diazoxide: enhanced hypotensive effect when alpha-blockers given with diazoxide

#### Diuretics: enhanced hypotensive effect when alpha-blockers given with diuretics, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

#### Dopaminergic: enhanced hypotensive effect when alpha-blockers given with dopamine

#### Methylene: increased risk of extrapyramidal side-effects when alpha-blockers given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa

#### Tetrabenazine: increased risk of extrapyramidal side-effects when alpha-blockers given with tetrabenazine

#### Amikacin see Aminoglycosides

#### Almikacin see Aminoglycosides

#### Amiloride see Diuretics

#### Aminoglycosides

- Agalsidase Alfa and Beta: gentamicin possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

#### Analgesics: plasma concentration of agalsidase alfa and beta possibly increased by indomethacin

#### Antibacterials: neomycin reduces absorption of phe-noxy-methylpenicillin; increased risk of nephrotoxicity when aminoglycosides given with colistin or polymyxins; increased risk of nephrotoxicity and ototoxicity when aminoglycosides given with capreomycin or vancomycin; possible increased risk of nephrotoxicity when aminoglycosides given with cephalosporins

#### Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with coumarins or phenindione

#### Anaesthetic: neomycin possibly enhances hypoglycaemic effect of acarbose, also severity of gastrointestinal effects increased

#### Antihypertensives: increased risk of nephrotoxicity when aminoglycosides given with amphotericin

#### Anti-infectives: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with coumarins or phenindione

#### Anticoagulants: increased risk of hypocalcaemia when aminoglycosides given with bisphosphonates

#### Cardiac Glycerides: neomycin reduces absorption of digoxin; gentamicin possibly increases plasma concentration of digoxin
Antivirals:  
· Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with ciclosporin  
· Co-trimoxazole: increased risk of ventricular arrhythmias; increased risk of ventricular arrhythmias when amiodarone given with rifampicin

Antimalarials:  
· Artesunate: increased risk of nephrotoxicity when aminoglycosides given with mefloquine—avoid concomitant use

Antiepileptics:  
· Lamotrigine: increased risk of nephrotoxicity when aminoglycosides are given with valproic acid

Antidepressants:  
· Duloxetine: increased risk of ventricular arrhythmias when amiodarone given with duloxetine

Anti-arrhythmics:  
· Amiodarone: increased risk of ventricular arrhythmias when amiodarone given with verapamil

Parasympathomimetics:  
· Muscarinic cholinergic antagonists: increased risk of toxicity when aminoglycosides given with loop diuretics

Muscle Relaxants:  
· Aminoglycosides: increased risk of toxicity when aminoglycosides given with non-depolarising muscle relaxants and etidronate disodium

Diuretics:  
· Furosemide: increased risk of ventricular arrhythmias when amiodarone given with diuretics

Aminoglycosides: (continued)  
· Cilastatin: increased risk of toxicity when aminoglycosides given with cilastatin

Cardiac Glycosides:  
· Digoxin: increased risk of ventricular arrhythmias when amiodarone given with digoxin

Antipsychotics:  
· Chlorpromazine: increased risk of ventricular arrhythmias when amiodarone given with chlorpromazine

Anticoagulants:  
· Warfarin: increased risk of bleeding when amiodarone given with warfarin

Antihistamines:  
· Desloratadine: increased risk of bleeding when amiodarone given with desloratadine

Anti-leukotrienes:  
· Leukotriene antagonists: increased risk of bleeding when amiodarone given with leukotriene antagonists

Calcium-channel Blockers:  
· Diltiazem: increased risk of ventricular arrhythmias when amiodarone given with diltiazem

Beta-blockers:  
· Propranolol: increased risk of ventricular arrhythmias when amiodarone given with propranolol

Loop diuretics:  
· Furosemide: increased risk of ventricular arrhythmias when amiodarone given with furosemide

Thyroid Hormones:  
· Levothyroxine: increased risk of ventricular arrhythmias when amiodarone given with levothyroxine

Antimuscarinics:  
· Pirenzepine: increased risk of ventricular arrhythmias when amiodarone given with pirenzepine

Antihypertensives:  
· Amlodipine: increased risk of ventricular arrhythmias when amiodarone given with amlodipine

Cystotoxics:  
· Cisplatin: increased risk of nephrotoxicity when aminoglycosides are given with cisplatin

Colchicine:  
· Colchicine: increased risk of bleeding when amiodarone given with colchicine

Calcium-sparing Diuretics:  
· Spironolactone: increased risk of bleeding when amiodarone given with spironolactone

Lipid-regulating Drugs:  
· Lovastatin: increased risk of myopathy when amiodarone given with lovastatin

Orlistat:  
· Orlistat: increased risk of bleeding when amiodarone given with orlistat

Amisulpride see Antipsychotics

Amitriptyline see Antidepressants, Tricyclic

Amlodipine see Calcium-channel Blockers

Amobarbital see Barbirurates

Amodarone (continued)  
· Amiodarone: increased risk of ventricular arrhythmias when amiodarone given with boloterodine

Antipsychotics: increased risk of ventricular arrhythmias when amiodarone given with antipsychotics that prolong the QT interval with antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with antipsychotics that prolong the QT interval

Amiodarone (continued)  
· Amiodarone: increased risk of ventricular arrhythmias when amiodarone given with amiodarone increased by cimetidine

Antidepressants: increased risk of ventricular arrhythmias when amiodarone given with antidepressants that concomitantly increase plasma concentration of amiodarone

Anticoagulants: amiodarone inhibits metabolism of warfarin and warfarin antagonists: increased risk of bleeding when amiodarone given with warfarin and warfarin antagonists

Antihistamines: increased risk of bleeding when amiodarone given with antihistamines

Antileukotrienes: increased risk of bleeding when amiodarone given with antileukotrienes

Calcium-channel Blockers: increased risk of bleeding when amiodarone given with calcium-channel blockers

Beta-blockers: increased risk of bleeding when amiodarone given with beta-blockers

Loop diuretics: increased risk of bleeding when amiodarone given with loop diuretics

Thyroid Hormones: increased risk of bleeding when amiodarone given with thyroid hormones

Orlistat: increased risk of bleeding when amiodarone given with orlistat

Amisulpride see Antipsychotics

Amitriptyline see Antidepressants, Tricyclic

Amlodipine see Calcium-channel Blockers

Amobarbital see Barbirurates

Amodarone (continued)  
· Amiodarone: increased risk of ventricular arrhythmias when amiodarone given with boloterodine
